The Nation.

NEW YORK, THURSDAY, JULY 7, 1892.

The Week.

THE passage of a bill for the free coinage of silver by the Senate near the close of the session and at the beginning of a Presidential campaign is one of the strangest things that it is possible to imagine. The details of the measure are likewise of the most whimsical description. The Bland Bill, which was stopped in the House by a tie vote, provided that for all silver brought to the mint legal-tender certificates should be issued at once. The bill which has passed the Senate makes no provision for certificates, legal-tender or other, but it does provide that all the silver bullion now in the Treasury shall be coined into standard dollars. The amount to be so coined is about one hundred million ounces. To coin all this metal into standard dollars would tax the capacity of the mint for two years, even if no other work were done there. But the coinage of gold and of small change cannot be suspended. Making allowance for this necessary work, the time required for coining all the bullion on hand would be at least three years. No silver dollars could be turned out for private depositors of bullion during that time. They would lose three years' interest on their capital. Meanwhile, the purchase of bullion under the act of 1890 would cease. If the mine-owners are benefited by the present law, of which there is room for doubt, they would lose that benefit and would get in exchange for it the promise of free coinage at the end of three years, taking the chance, of course, that the law might be repealed in the interval. Mr. Bland apprehends also that the bill, in repealing the act of 1890, will take away the legal-tender character of the Treasury notes issued under that act.

What will be the complexion of things if the bill passes the House and is vetoed by the President? That he would veto it is well known. The Colorado and Nevada Senators have so declared with extreme bitterness. Mr. Harrison virtually advertised his intentions on this head in his speech at Albany last year. Since that time an additional, and to the President an overwhelming, reason for a veto now exists in the international monetary conference which he has called, and which has been already agreed to by all the important nations of Europe. To pass a free-coinage bill in the face of a conference which assembles solely at our instance, would be little less than an insult to all who have been invited to participate in it, since it would forestall everything, including the ratio to be fixed upon. The President, if he had not given any other sign of his intention, would surely treat this bill as an impertinence both to himself and to the Powers whom he has invited to confer with us. When we look at the Senate bill in this aspect, we have to blush for shame. What must other nations, who have been asked by us to come together in a world's council to discuss this very question—what must they think of us when we take the word out of their mouths and decide it for ourselves? A veto of this bill by President Harrison would restore his waning popularity in the East, and would strengthen the Republican party immensely in business circles everywhere. The issues of the campaign would be changed in a twinkling. The tariff and pension profligacy would be swept out of view, and the standard of value, in which all property and savings and income are reckoned, would become the overshadowing question before the people. For the Democrats to exchange their fair prospects for such a risk as this at such a moment would be the maddest adventure in politics since the civil war.

The People's party Convention, which has just completed its sessions at Omaha, was the most largely attended and most thoroughly representative national gathering which any third party has ever got together. All sections of the country sent delegates, and the delegates were full of enthusiasm. The dominant tone of the assembly was discontent with existing conditions. A large part of this discontent was the vague dissatisfaction which is always felt by the incompetent and lazy and "shiftless" when they contemplate those who have got on better in the world. But there was also manifested that spirit of doubt as to the tendencies of our social development of late years which is shared by many thoughtful and philosophic observers, and which causes such observers to question whether something should not be done to check these tendencies. Practically the platform declares that everybody could be made happy if the Government would print a vast quantity of paper currency, allow free coinage and foist light-weight silver dollars upon the country, establish an immense loaning agency, and take control of the railroads. In other words, the fundamental theory of the party is that the Federal Government is an institution of such omniscience and omnipotence, such a repository of wealth and wisdom, that it can be trusted with limitless power. In short, the theory holds that a paternal government can make all its children "healthy, wealthy, and wise." General Weaver is the proper candidate for President of such a party. He is a demagogue who came to the surface in the Greenback period, and was nominated for President by that element in 1880. He is the sort of man who is always ready to take up with any new organization which can give him either office or prominence, and no platform could be constructed so ridiculous that he would not gladly stand upon it. He is the fit product of a convention in which Ignatius Donnelly was one of the most popular orators.

The national platform of the Prohibitionists, outside of the prohibition planks, is a great surprise. In fact, it is one of the most striking marks of the progress of political intelligence that have recently been presented. As reported, the platform contained a declaration in favor of the free and unlimited coinage of silver and gold, but this was struck out by a vote of 335 to 596. A plank to the effect that the general Government ought to issue all money, the amount to be fixed at a definite sum per capita, was adopted, but with a good deal of opposition. But, what is most significant, the Convention voted down a declaration in favor of protection, and adopted a plank that is substantially hostile to all indirect taxation. "Tariff," it says, "should be levied only as a defence against foreign governments which levy tariff upon, or bar out, our products from their markets, revenue being incidental." This means free trade, at least with free-trade governments. There are a number of declarations of minor importance, and the platform concludes with a very hearty denunciation of both the Republican and Democratic parties for their many iniquities, much of which denunciation is deserved. Upon the whole, the Prohibitionists have done well, and the indications are that they will poll their full vote this autumn.

Mr. John W. Foster of Indiana, the new Secretary of State, is probably better fitted than any one who could be named to fill out the term of this Administration; and if President Harrison is reëlected, the continuance of Gen. Foster in the State Department would help to retrieve the blunder made in the choice of his predecessor. It has been alleged against him that he is disqualified for the office by the "entangling alliances" he has formed with the governments of other countries in the shape of legal retainers accepted from them. This seems to mean that acquaintance with diplomatic usage and with the most important questions to come before the State Department is really a bad thing in a Secretary, who, on this theory, would be much better fitted for his office if he knew nothing of its duties. It is further and more seriously alleged that he has made himself obnoxious to the following section of the Statutes of the United States:

"Sec. 5,498. Every officer of the United States, or person holding any place of trust or profit or discharging any official function un-

der, or in connection with, any executive department of the Government of the United States, or under the Senate or House of Representatives of the United States, who acts as an agent or attorney for prosecuting any claim against the United States, or in any manner or by any means otherwise than in the discharge of his proper official duties, aids, or assists in the prosecution or support of any such claim, or receives any gratuity or any share of or interest in any claim from any claimant against the United States with intent to aid or assist, or in consideration of having aided or assisted, in the prosecution of such claim, shall pay a fine of not more than five thousand dollars, or suffer imprisonment not more than one year, or both."

It is said that Mr. Foster has been discharging official functions "in connection with" the Department of State during a large part of Mr. Harrison's Administration, and has been serving foreign governments at Washington city and prosecuting their claims against our Government and receiving their pay at the same time. If this is true, and we fear it is, he is now liable to fine, or imprisonment, or both, under the statute above quoted.

We observe that Ohio Republicans are greatly dissatisfied with his appointment, but this doubtless springs from their failure to see how the "Ohio idee" has gone out of politics. The last census, we believe, showed that the centre of gravity of the population of the country had shifted from Ohio into Indiana. Certainly the political sceptre has passed from the hands of Ohio in a remarkable degree. The Ohio delegation at the Minneapolis Convention behaved with such conspicuous folly that they hardly dared go home; and ex-Senator Thurman gave fit expression to the disgust of the decent Democrats of the State at the way Senator Brice and his tools showed their imbecility at Chicago. In Republican politics, at any rate, the Hoosier idea is now to the front, and those fastidious Republican Senators who are reported as disgusted at seeing the White House made the glass of Indiana fashion and the mould of Indianapolis form, will support their ticket with many qualms over what the future may have in store for them in the way of unconventional manners in high places.

The President's letter to the New York League of Republican Clubs conveys a rebuke to all those Republican organs which have been a little slow in pumping up hysterics over the tariff issue. It will no doubt take them some time yet to lash themselves into a suitable degree of fury, but Mr. Harrison is already in a state of great excitement and alarm. His letter is somewhat incoherent, as is but natural coming from a man filled with such consuming and unselfish anxiety for imperilled American workingmen; but in so far as it is possible to get at his statements of fact, they appear open to serious question. He says of the tariff plank originally proposed in the Democratic Convention by the Committee on Resolutions, that it "seemed to recognize that some regard might be had in tariff legislation for the interests of our American workingmen." That word "seemed" is important. The plank here commended by Mr. Harrison is almost precisely the same as the planks of 1884 and 1888, which, in both those years, "seemed" to the same gentleman to show no regard whatever for his beloved workingmen. The Democratic tariff plank of 1884 spoke of the determination not to deprive "American labor of the ability to compete successfully with foreign labor," and of the need of having regard to the "increased cost of production which may exist in consequence of the higher rate of wages prevailing in this country." But Gen. Harrison joined in the shrieks of Mr. Blaine that this meant starvation or starvation wages to American labor. The platform of 1888 contained similar phrases, but the Republican candidate of that year was black in the face with shouting that they meant destruction to American industry. Now he says that his patriotic rage of that campaign was uncalled for, and that it is *this* year that the real and only assault on the workingmen has come. To an impartial mind it "seems" as if Mr. Harrison were so uncommonly anxious to have a "save-the country" campaign that he had made himself a little ridiculous.

He has worked himself into such a state of mind that he has forgotten the history of his own times. He says that the Democratic tariff plank of this year, as finally adopted, constitutes "a declaration more extreme and more destructive than has ever before been promulgated by the Democratic party." A Republican "from way back" ought to know what the Democratic tariff policy was in 1856. The National Democratic Convention of that year resolved that "the time has come for the people of the United States to declare themselves in favor of free seas and progressive free trade throughout the world." The same party's platform of 1852 declared that "justice and sound policy forbid the Federal Government to foster one branch of industry to the detriment of any other." The President's memory must go back to those years, and he must recall the fact that he heard no crack of doom then, in spite of the fact that the party advocating such baleful principles was successful in both campaigns. He will remember also that the people of the United States were then living, and had been for ten years, under what he would now call a free-trade tariff. It was certainly a tariff which made a nearer approach to free trade than any that has been framed since, or that will be framed for many years to come. The President must also remember, or if he does not he can read it in the veracious chronicles of his late Secretary of State, that it was a tariff under which the country had an unexampled degree of prosperity. It emphatically did not sink American wages to the level of those of "the pauper labor of Europe," did not close factories and throw thousands of workingmen out of employment, or check our industrial expansion. So unmistakable was the commercial and industrial well-being of the country at that time that the Republican platform of 1856 did not question it or the economic policy under which it had been brought about. But for the civil war and the enormous taxation which it made necessary, our latter-day protection would never have been heard of.

There seems to be no doubt that Republican politicians are much concerned over the prospect of a great strike in the iron industry, nor that the Washington managers have intimated to the manufacturers that a proper sense of loyalty to the Republican party ought to prompt an adjournment of the reduction in wages until after the election. The manufacturers are reported as saying that it is business and not politics with them. This being so, the alarmed Washington Republicans should try to make a peaceful settlement of the difficulty in a "business" way, and we suggest to them a method which is simple and would surely be effective. Let them excuse the manufacturers from their usual heavy contributions to the Republican campaign fund, on condition that they apply the sums thus saved to paying the former rate of wages to their employees. Or, better yet, let Treasurer Bliss take the checks of the iron-men and endorse them over to the Amalgamated Association. This would be a supreme proof of Republican sincerity, as it would show that the party is willing to turn over its money to American workingmen direct, instead of wasting a good part of it on maintaining headquarters and hiring bands and buying blocks of five. And as the only reason which leads the iron-manufacturers to submit to political assessments is their desire to pay high wages, they would certainly agree to this disposition of their contributions.

The facts brought out in the Senate last week in the debate on the Pension Appropriation Bill ought to startle the country into a realization of the perilous length to which the pension abuse has been carried As it came from the House Committee the bill appropriated over $133,000,000. The Senate Committee has amended this by increasing the amount to $144,956,000. In explaining this increase, Senator Stewart said that when the bill passed the House early in the session, it was supposed that there would be a surplus for the current year of from ten to fifteen millions, unexpended from last year's appropriation, but it had since been discovered that instead of a surplus there would be a deficit of $7,600,000. The Senator went on to say:

"The Committee on Appropriations had be-

fore it the Commissioner of Pensions and other officers of the Bureau, and learned from them that at the present rate of pension payments—$13,000,000 a month—it will require $156,000,000 to pay pensions in the next fiscal year. So that it is very probable that, even with the amount recommended in the amendment, there will be a deficiency in the next fiscal year of from $10,000,000 to $15,000,000. But the Committee did not desire to ask so much, because it was thought better to leave it to a deficiency."

Mr. Stewart admitted that if the work in the Bureau were pushed, the expenditure for pensions during the next fiscal year might run up to $155,000,000 or $160,000,000. This would nearly absorb all the customs revenue of the country. In his article in defence of the Harrison Administration in the June number of the *Forum*, Senator Hawley placed the pension expenditure at about $140,000,000, adding that it "is supposed that the number of pensions will reach their maximum within the next year." At present no man knows what that maximum will be, but the prospect is that, by the time it is reached, the total of annual expenditure will amount to $200,000,000. That is the price which the Republican party is making the country pay in order that the party may get the benefit of the "soldier vote."

In spite of the distinguished position occupied by Prof. Dwight, whose unexpected death startled the community last week, it is doubtful if the public is at all aware of the extent of its loss. He was the creator of a famous school of law, and it was as a teacher and professor that he was most widely known. It is unnecessary to remind our readers of his services and his success in this direction, for the number of his pupils is so large as to insure them due public recognition and commemoration. But it was as a kind of guardian of the fundamental institutions of our jurisprudence that Prof. Dwight rendered a service that was almost unique. He knew the law perhaps more thoroughly than almost any practitioner or almost any judge, and, being relieved from the excessive pressure of business that now comes upon both bench and bar, he was able to utilize his knowledge with reference to its applications to the general interests of society. If a constitutional convention were proposed, his name was naturally the first thought of for membership, and it is doubtful, now that he is gone, if any other name could be mentioned by the bar which would carry so great influence with the public at large. When we reflect upon the character of our recent legislatures, and consider the influences that dictate our laws, it is impossible not to be affected for the time with apprehension at the results of the removal of this great conservative force. We have lawyers of unsurpassed ability, we have reformers of abundant zeal, we have an undiminished fund of public spirit, but we have now few public men generally recognized as animated by unselfish devotion to the public welfare, ardent in the cause of social and legal reform, and at the same time fully qualified by their prolonged studies and extensive experience to prepare and apply measures of genuine wisdom. Such a combination of qualities is always rare, and tends to become increasingly so with the greater hurry of modern life and the extreme diversification of modern interests. Yet we may feel that Prof. Dwight's influence upon his pupils must have been sufficient to arouse in many of them a desire to emulate his career, and it is not unreasonable to hope that in his case the good that he has done will live after him and not be interred with his bones.

It turns out that Egan and McCreery, although they applied for and obtained two months' leave of absence, to begin March 1, have not yet made use of it, and are still in Chili. The latter is probably finding it more difficult to wind up his speculations in the market than he had anticipated, and perhaps both he and Egan think it would be as well not to return to this country until after the adjournment of Congress and the passing of all danger of a Congressional investigation. Perhaps, too, one thing that troubles our Minister to Chili is a recent publication in that country of the entire diplomatic correspondence between the Chilian Government and ours touching the recent disputes. Aside from the charge, which appears to be proved in this volume, that he wantonly exaggerated his reports and his instructions in order to inflame already excited feeling, he will find it very difficult to explain his conduct in refusing to leave a copy of a certain despatch with the Chilian Minister for Foreign Affairs, although he had specific directions from Acting-Secretary Wharton to do so. Meanwhile, he is every day finding fresh proof of the high regard in which he is held by Americans on the spot. But a short time ago he applied to the Chilian Government to protect him against assaults on his character made in the public press by Americans among others, and on July 4 neither he nor McCreery received an invitation to be present at the patriotic meeting of the American colony in Santiago. The President ought to recall these misrepresentatives of the United States without delay. To retain them, in spite of Chili's desire that they be replaced, while immediately bringing home an attaché of our legation in France at the request of the French Government, is to make it appear as if he were anxious to deserve what was said of him by Mr. Depew in his nominating speech, that "no country is too small" to feel the weight of his valorous resentment.

Ruy Barbosa has seen the letter which Minister Mendonça wrote to the *Evening Post*, asserting that Mr. Blaine's "promise" in the matter of the Brazilian treaty was made impossible of fulfilment by the McKinley Bill. The Brazilian ex-Secretary says of this assertion, in a letter which was published in the *Jornal do Commercio* of May 17, that it is "simply a piece of inconceivable effrontery." He puts some suggestive dates together. The McKinley Bill became law October 1, 1890. Twenty days later, Barbosa telegraphed Mendonça: "You may go on with the negotiation in accordance with the terms of your letter just received." The "terms" of that letter, which Barbosa quotes, set forth that "a *general exemption* from the duty on sugar is of no avail to us; we need an *exclusive favor* for our product." Moreover, when in Brazil in the latter part of 1890, Minister Mendonça contended that he had secured for Brazil this "exclusive favor," saying in an autograph letter, dated December 17, two months and a half after the McKinley Bill became law: "As to sugar, we are to enjoy the advantages of free admission, to the exclusion of European colonies in America." With this statement of the case, Barbosa says he is willing to "leave the chief actor in the affair to the judgment of the public of the two countries," though he urges the Brazilian Government to publish *in full* the correspondence relating to the treaty.

The British colonists have met their usual fate in attempting to persuade the English that the interests of the Empire require a return to the protective system. They were more sanguine than usual this year on account of the supposed intimations in Lord Salisbury's speech at Hastings, and the natural exasperation of the English at the multiplication of tariff obstacles to trade. But at the Congress of the Chambers of Commerce of the Empire lately in session at London, they were unable to carry Sir Charles Tupper's resolution declaring that a small differential duty should be adopted by Great Britain and her colonies, being defeated by 79 votes against 34. His resolution was offered as an amendment to one which declared that a fiscal union between Great Britain and her colonies by preferential duties, being based upon protection, would be politically dangerous and commercially disastrous, and that the arrangement that would best conduce to an intimate commercial union would be for the self-governing colonies to adopt, as closely as circumstances will permit, the non-protective policy of Great Britain. We cannot fully estimate the significance of this vote until the detailed report of the proceedings of the Congress reaches us, but it at least signifies that all hope of imperial federation based upon protective tariffs may as well be abandoned. While the resolution adopted may not lead the Colonial Governments to change their policy, it will encourage the supporters of free trade and weaken the protectionist feeling.

"FORCING THE FIGHTING" IN THE SENATE.

THE tariff debate in the Senate on June 29 between Senators Hale and Vest was a delightful contribution to the literature of the subject, and a sample of what the Republicans have to expect in their avowed determination to "force the fighting" on the tariff issue. Mr. Hale started out in the jauntiest spirit. He had introduced some resolutions to hang his speech upon, which recited that at "no time has so large a proportion of the American people been employed at so high wages, and purchasing the necessities and comforts of life at so low prices, as in the year 1892." His speech was absolutely limited to a review of the tariff plank of the Democratic platform and the manner of its adoption, the showing of a large "balance of trade" during the past year, and the familiar denunciation of the Democrats as upholders of "British doctrine." He made no semblance of an attempt to prove his assertion about "high wages" or "low prices," and, having delivered himself of the remarks which we have fairly summarized, he triumphantly announced that "the Republicans of the United States gladly accept the issue presented," and sat down.

A boy out hunting sparrows with a popgun could be no more horrified at seeing a grizzly bear rise in his path than the Maine Senator must have been at the speech of Senator Vest which followed. It was no extemporaneous effort on the latter's part. He had evidently been preparing himself to meet just such a Philistine, and proceeded to rend him in the most approved fashion. Through thirty pages of the *Record* he poured out facts and arguments on the gentleman from Maine, and all that that astonished Senator could say was, that, "before this debate closes, the demonstration will be given to the Senate showing his inaccuracy." Senator Vest cruelly inquired: "Why not give it now?" But Mr. Hale replied: "That was not my original purpose." In other words, he was not loaded for bear. No more was Senator Aldrich, to whom Mr. Vest appealed as the "tariff expert" on the Republican side, nor any other Republican Senator, so that the Missourian's overwhelming broadside is allowed to go into the *Record* and to the country to give the impression that, for the time being at least, it blew the Republicans clean out of the water.

Senator Hale's easy assertion about "high wages," without one fact adduced in support of it, "largely due to the Republican policy of protection," looked particularly silly after Mr. Vest had put in his list of "250 strikes and reductions of wages" occurring between December 4, 1890, and June 18, 1892, and all in industries "protected" by the McKinley Bill. The largest number was in manufactories of iron and steel, although Mr. Oliver has declared that McKinley gave the iron-men "everything they asked for," and, of course, they asked for no tariff except to be enabled to pay the high rate of American wages. Many instances of reduced wages are also given in woollen and silk manufactures, and in the glass and pottery industries, in all of which the McKinley Bill made great advances in duties for the express purpose, as its author alleged, of keeping up and increasing wages.

The Maine Senator's unsupported statement in regard to the unprecedentedly "low prices" now prevailing was in equal need of repairs before Mr. Vest got through with it. He first produced a lot of actual samples of various kinds of cloth and dress goods, mostly such as are used by the poor, and showed how, with but one trifling exception, a comparison of the cost of these goods in the New York market prior to October, 1890, and at present, showed marked advances, in some cases amounting to as much as 20 per cent. This was in face of the fact that foreign prices on the same goods had in the same period considerably declined. This table of Senator Vest's, which he particularly, but in vain, asked Mr. Aldrich to impeach if he could, is additionally instructive in its revelation of the fact that the rates of duty on the low grades used by workingmen are considerably higher than on better qualities, and also that American consumers are not permitted by McKinley to enjoy the general decline in prices which foreigners benefit by, owing to reduced cost of raw materials and better methods of production.

Perhaps the most heavily shotted gun of the Missouri Senator was his list of 100 tariff Trusts, with specifications as to the details of each. He wanted the people to have this before them as "the Senator from Maine makes this gladiatorial raid throughout the country on the tariff question." It is a compilation which is peculiarly timely now that the vaunted anti-Trust legislation of the Republican party is falling to pieces in the courts. The tariff on the articles monopolized by these various combinations is the great bulwark behind which the monopolists can shelter themselves. In each instance Senator Vest shows just how high that bulwark is and how it works, and gives many instructive details about the progress of the Trusts, several of which are in the hands of English capitalists, who are enabled by our intensely "American" tariff laws to take the people of this country by the throat. The whole array is a most impressive one, and is destined to shut the mouths of a great many Republican orators in the campaign, just as it left the Republicans of the Senate dumb on Wednesday week.

The debate in question is of great value, as showing the difference in the situation of the two parties on the tariff issue now and four years ago. Then the Republicans declined to commit themselves to any particular "schedules," but fell back upon their general worship of protection. But now they have got their "schedules," and must defend them. "Republican protection" has now a definite embodiment in the McKinley Bill. It is that definite protection which the Democratic platform declares to be a "fraud" and "robbery." Senator Vest shows how easy it is to prove that proposition. His encounter with Senator Hale may be taken as an indication of the spirit and results with which the tariff discussion will be carried on. The boy with a popgun is scarcely in a position to "force the fighting" with a grizzly.

THE SALVATION ARMY AND THE CHURCHES.

WHEN the Salvation Army first made its appearance in this city, it was so easy to make fun of that it immediately gained a good deal of notoriety and no end of "handsome notices in the press." But as soon as it had been squeezed dry of all the humor that it contained, it lost its attractions as a topic of newspaper remark and private conversation, and has been pretty much lost sight of for a considerable period. There are unmistakable signs, however, that it has made substantial headway. The well-known uniform is oftener seen in the streets. At the grand "encampment," or whatever they call it, of the Army a few weeks ago, large audiences, not only of adherents but of sympathizers, were gathered together in successive meetings. The great majority of the spectators went not as to a curious spectacle, but as to a serious assemblage convened for rational purposes.

At that time, residents in some of the fashionable parts of the city were surprised to see persons in Salvation Army uniforms, who were really out-of-town delegates, entertained in well-to-do homes just as if they had been members of any religious or charitable convention. This seemed to bear witness to sympathy with the aims of the Army in social quarters where such a thing had scarcely been suspected by the generality. Little by little, evidence has come out that what is known as the Auxiliary League of the Salvation Army has been winning many members among church people whose social position is as high as is their reputation for philanthropy. This League is designed to secure the support of people of wealth and standing who approve the general aims of the Army, but would not "enlist" as active members. Those who join it are simply required to endorse its general object "to extend the kingdom of God," to pay their membership fees and annual dues, and to accept a pin or badge which they are at liberty to wear or not as they choose. Particular attention has been directed of late to this branch of the Army's work, through the public announcement that the League had been joined by eminent religious leaders, such as Prof. Briggs, Dr. Lyman Abbott, and others, with their wives.

The main significance of their action, as of that of many others who have identified

themselves with the Auxiliary League, lies undoubtedly in their deep humanitarian feeling and their desire to lend their influence to any movement which does good. So far from wishing it to be understood that they approve of all of the methods of the Salvation Army, they distinctly say that they dislike exceedingly some of those methods, and are dubious about the wisdom of more. Yet it is apparent that one of the strongest motives by which they are actuated is their clear conviction that the Army is succeeding where the churches have failed. Thus, Dr. Abbott is reported as saying: "The Salvation Army is doing a glorious work in going among the lowly and rescuing them from vice and shame and misery. No church could do the work, no minister of the Gospel could do the work." Another clergyman, who has also joined the League, gave it as his testimony: "The Army's workers have had wonderful success with the lowly whom the churches cannot reach."

The movement in question, therefore, is but one of many signs and confessions that the churches are not succeeding in their appointed work of "preaching the Gospel to the poor" in great cities. The Auxiliary League, in fact, makes its strongest appeal to people who have had the disappointing nature of the recognized church methods forced home upon them in their own experience and labors. Teachers in mission schools, for example, keep a dubious hold for a few years upon the children of the poor, only to see them go away into vice as soon as they get old enough to defy the parental use of the Sunday-school as a supplementary police force, and are not unnaturally disheartened and made to question the wisdom of their own methods. Then they see the Salvation Army getting a grip on the vicious and hardened, even of adult age, and apparently reclaiming many, and it is not strange that they accept the results as sufficient justification of the methods.

Now, as to the general organization of the Salvation Army, it seems to us that the analysis of it made by Prof. Huxley a few years ago was unanswerable and destructive. It is an embodiment of arbitrary and irresponsible power such as no lover of human freedom or believer in individual initiative can wish to see acquire an extended sway. Its actual methods of work are undoubtedly wise—for the accomplishment of its immediate end. It makes a business of religion. It takes the underlying idea of the "class" system of the Methodists, the guilds of the Episcopalians, and the sodalities and other associations of the Catholics, and extends it after its own fashion, watching over its "converts" day and night, setting them to preaching to others as soon as reclaimed themselves, and striving to maintain their first enthusiasm and zeal from year's end to year's end. It is not strange that such a system, working in the way it does and upon the material it does, should make far better headway than the churches in the same field. And if the great end of work among the lower classes of society is to get an early crop of "converts," we do not wonder that church people are admitting the superiority of the Salvation Army methods over their own intermittent and unfruitful activities, and are joining the Auxiliary League with enthusiasm.

It seems to many students of social problems, however, as if a great mistake of religious and charitable laborers among the poor had been just this feverish haste to get immediate and tangible results. It is at least a fair question if more meagre returns in the beginning may not be consistent with really wiser measures and more substantial results in the long run. Such scientific methods as Mr. Charles Booth advocates and exemplifies in the treatment of the poor and vicious population of great cities promise small immediate, but finally large and enduring, success. A good analogy may be drawn from missionary labors among the heathen: the first efforts have to be directed towards civilizing rather than converting. The heathen who inhabit Christian cities are in equal need of being approached from the physical side, and built up into the raw material of civilization by patient and prolonged teaching.

VOTING UPON COMPULSION.

THE plan for compelling the exercise of the right of suffrage by those qualified to exercise it seems to have had some attractions for political theorists, in spite of the fact that it owes its recent prominence to the recommendation of a very practical politician, Senator Hill of New York. But these attractions are completely dispelled by Prof. Albert B. Hart, in an essay upon the subject which appears in the last number of the *Political Science Quarterly*. He begins with an analysis of the assertion that, owing to abstentions from voting, government in the United States is in the hands of the minority, and that therefore legal pressure must be brought to bear upon the stay-at-home voters in order that we may have a government of the whole people. This suggestion, Prof. Hart declares,

"will be found to rest on three premises: that abstention from voting is a political danger, and a danger which increases; that a government may properly require an expression of opinion from its people; and that compulsion will correct the evils of neglect of voting. Not one of these premises is beyond dispute; they are all matters not so much of theory as of experience and of probability based on experience. A careful examination of the available facts will show that the evil is much less than has been assumed; that suffrage is a thing which ought not to be imposed under any government; and that the effect of compulsion would be small, and rather against than favorable to good government."

As to the amount of abstention, it appears from Prof. Hart's investigations to be much exaggerated. We recently made some computation of the number of persons in the New England States qualified to vote or capable of such qualification, which, although based upon other tables, is in substantial agreement with Prof. Hart's estimate. In this computation we included in the "dumb vote" foreigners who had not sought to be naturalized—an element which the purposes of Prof. Hart's article require to be eliminated as not subject to compulsion. His computation differs from ours in applying to the country at large. Taking the year 1880 as a basis, that being a year in which a census was taken and a Presidential election also occurred, he finds that there were in the country some 12,500,000 adult males, of whom 3,000,000 were foreign-born. An elaborate count made in Massachusetts in 1885 indicated that about one-half the adult foreigners in that State were naturalized, and, taking this proportion as correct, the number in the country would be some 1,500,000. Some minor additions being made, there were in 1880 about 11,400,000 persons *prima facie* qualified to vote. But under the laws of the various States there are many disqualifications. Illiterate persons, paupers, and convicts are in some cases denied the right of suffrage by statute; insane and bedridden persons are denied it by nature. A great many votes are lost from change of residence, the number being incomputable, but guessed by Prof. Hart to be 110,000—in our judgment a low estimate. With these deductions Prof. Hart finds the number of legal voters in 1880 to have been 11,000,000. There voted that year for President all of these but about 1,800,000, or one-sixth of the total number, and Prof. Hart observes:

"A very brief consideration will show that when five-sixths of the voters come to the polls, no compulsory system could much increase the number. There are few churches, clubs, societies, or lodges in the country which have an attendance of five-sixths, even once a year; there is not an army in the field which can put five-sixths of its men in the ranks for a battle. There is not another country in the world which has ever exhibited so large a proportion of actual voters as the United States. Germany is a very intelligent country—a country where the roads are good, changes of residence are infrequent, and political interest is high. In the German election of 1887 the number of votes cast was but 77.5 per cent. of the number of voters—a little more than three-fourths."

But out of this one-sixth are still to be taken the aged, the sick, the travellers, the sailors, many students, many railroad men, and those accidentally prevented from carrying out their intention, to say nothing of negroes prevented by intimidation. The latter class alone is estimated by Prof. Hart to number 560,000, and the total number of those who do not vote from these causes he puts at 1,500,000, leaving but 300,000 qualified voters who abstained from voting for President in 1880 from all other causes, including lack of interest.

It is true that in State and municipal elections the number of abstentions is far greater, but the proportion is steadily de-

creasing. This part of the subject is not dealt with statistically by Prof. Hart, but he produces some general considerations that are sufficiently cogent. The law forbids many things, but there are few acts the performance of which it undertakes to compel, and if compulsion were desirable it would be practically impossible to enforce it. Prof. Hart makes a collection of early colonial statutes providing penalties for failure to vote, but they were of no effect. He criticises effectively the various penalties suggested in modern times, but his most weighty objection to them all is that abstention is often the best way of expressing political preference. Prof. Hart might have gone deeper into his subject; we should have been glad to see an examination of Mill's doctrine that the suffrage is a trust. But he has done enough to show that it is doubtful if the supposed evils of indifference and neglect on the part of voters exist to so alarming an extent as has been supposed, and has made it evident that compulsory voting would at all events be no cure for them. His essay should lead to the relegation of the subject to the limbo of impracticable schemes.

FOUR THOUSAND IMMORTALS.

It has often been asserted that Americans are peculiarly fond of titles. It may be doubted whether we really care more for such decorations than Englishmen or Germans, but it is probable that we care at least as much. Collectively committed as we are to the theory that all men are created equal, it is grateful to us as individuals to achieve some differentiation, and to have it outwardly and visibly signified in a title. Titles of nobility are barred; but military, ecclesiastical, and scientific prefixes and suffixes are open to us and are worn with decent pride. Unfortunately, however, the democratic instinct reacts against these aristocratic distinctions. It asserts that one man has as good a right as another to brevet himself colonel or reverend or professor; and, the right being largely exercised, a practical equality is reëstablished. The titles become so common as to be worthless, except as material for the American humorist.

Quite in line with these tendencies is the evolution, or rather the degeneration, of scientific associations in this country. Composed at first of scholars of recognized position, these bodies tend to include all who busy themselves, successfully or unsuccessfully, with the special science which each particular society aims to advance. Membership is conferred upon mere dilettanti, and is at last sown broadcast among the intelligent public wherever the interest felt, however vague, is sufficient to produce an annual payment. The American Association for the Promotion of Social Science passed through this evolution a generation ago; and the American Historical Association, to take a single recent example, is moving in the same direction. Other societies, especially those devoted to philology, economics, and the natural sciences, remain somewhat more exclusive; but in very few are the qualifications of candidates for membership scrutinized with much severity.

The most popular—not to say populous—of all these associations is one of the youngest. That extension of membership which has generally resulted from the gradual abandonment of stricter standards has, in this case, apparently, been contemplated from the outset. The American Academy of Political and Social Science, founded at Philadelphia in December, 1889, has all the outward semblance of a scientific society. It has a governing council of a more or less scientific complexion, a number of the councillors being connected with the University of Pennsylvania, and no person is eligible to membership unless approved by the council. It has also an "advisory committee," which includes some of the most distinguished publicists and economists of the country. But it does not appear that any person who is willing to pay the annual fee of five dollars is likely to be disapproved by the Council. It does appear that a great many respectable persons who were quite unconscious of having achieved eminence in political science, have had it thrust upon them by the unexpected notice that they had been elected members of the Academy—the notice being coupled in each instance with a request to remit five dollars to the Treasurer. Early in the second year of its existence the membership of the Academy was brought to the surprising total of 2,000, and we understand that it has since doubled.

Encouraged by its American triumphs, the Academy has extended its operations to the other side of the water, and has begun to confer the unsolicited honor of membership upon many Englishmen. In a recent number of the London *Truth*, Mr. Labouchere, surprised by the methods of the Academy, asks for information regarding its character. International courtesy and the interests of science impel us to furnish the information which Mr. Labouchere desires.

The American Academy of Political and Social Science is a subscription list. Membership in the Academy is a decoration which is conferred upon each annual subscriber. The periodical which is thus supported is known as the *Annals* of the Academy. Its editor-in-chief is Prof. E. J. James of the University of Pennsylvania. Prof. James founded the Academy, and has been its President from its foundation. The *Annals* is primarily an organ of Prof. James and his associates in the University of Pennsylvania. It is not exclusively devoted to the publication of their writings: it solicits and receives contributions from other scientific authorities. It is an organ of the University of Pennsylvania in the same sense in which the *Quarterly Journal of Economics* is a Harvard organ, and the *Political Science Quarterly* a Columbia organ. In each of these cases the control of the periodical is in the hands of the professors of a single university. The Pennsylvania organ differs from the other two in its pretence to represent a national organization. They differ from it in that they offer no chromos to their subscribers.

When the American Academy of Political and Social Science was established, there were already in existence, as we have stated, the American Social Science Association and the American Historical Association. There were also in existence the American Economic Association and the American Statistical Society. But there was no American "academy" of the political sciences, and "academy" has a better ring than "association" or "society." It suggests something more exclusive. In other words, "Member of the American Academy" is a well-sounding title; nothing quite like it had previously been sold, and it was therefore eminently salable. The rapid growth of the Philadelphia Academy shows the justice of these calculations. Of course such an exploitation of a title has its limits. The more it is sold the less becomes its market value. But the limits do not seem to have been reached yet. The token has been debased, but it still circulates.

We have no means of knowing whether the "advisory committee" of distinguished scholars, many of whom are professors in other universities, ever give advice to the Academy, or whether their advice, if given, is heeded. It is not to be presumed, however, that they have recommended the touting methods which the Academy is pursuing. It is not probable that they have done, or have ever expected to do, anything but lend their names, with American good nature, to what seemed to be a worthy object. But if they are aware of the manner in which the Academy is being run, they are stretching tolerance too far in allowing their endorsement to stand on Prof. James's prospectuses.

Correspondence.

RAPHAEL'S HOURS.

To the Editor of The Nation:

Sir: In view of the renewed interest in the so-called "Hours of Raphael" awakened by Miss Williams's attractive book, will you kindly grant me the space in your columns for a few words upon this vexed question?

A writer in the *Edinburgh Review*, whose paper was reprinted in *Littell's Living Age* for March 14, 1891, declared that two of them are identical with frescoes at Herculaneum. Now I have in my possession a photograph taken from a Pompeiian fresco in the Naples Museum, numbered 5377, as a Bacchante in Sommer's catalogue, and called "Vanità," which is absolutely the same as the "Hour" named the "Sixth Hour of the Day." We know that Raphael and his pupils drew from the mural painting in the Baths of Titus, and as those were built just before the destruction of Pom-

peii, it seems highly probable that the same artist worked in both places, and that the airy form of Vanità danced alike upon the walls of the Pompeiian dwelling and upon the Baths of the Emperor, whence she was transferred, without the alteration of a flower, to the ceiling of the Vatican. Would that careful search might once more reveal her, floating amid the heap of confused remains which are grouped under the general name of "Baths," to bear witness once again to the truth of the oft-repeated saying, that all, indeed, is Vanity!

Miss Williams seems, like every one else, unable to explain when or how the "Hours" vanished from the ceiling. If the papal generosity which has opened these long-closed Borgia rooms to the public, would permit some scholar to inspect the "house-keeping books" of the Vatican, he would probably learn to whom the money was paid by Leo X. for the decoration, and the time and cause of the present condition of the ceiling, on which they no longer seem to be found.

Respectfully yours,

ANNIE RUSSELL WALL.

NEW BEDFORD, June 28, 1892.

Notes.

A MODERN German novel, Gottfried Keller's 'Dietegen,' has been annotated for school use by Gustav Gruener of Yale, and will be published by Ginn & Co.

A 'Graded and Annotated List of Five Hundred Available Books for the Young,' prepared by George E. Hardy, a New York grammar-school principal, is soon to be issued by Charles Scribner's Sons.

A. C. McClurg & Co., Chicago, announce that the *Dial*, which has hitherto been published by them, to their credit and to the advantage of the readers of that excellent literary journal, has passed from their hands to become the property of Mr. Francis F. Browne, its editor and part owner from the commencement.

The publishing house of Nicola Zanichelli of Bologna has just initiated a "Library of Italian Political Writers" with the writings of Cavour. It has in the press, independently of the above, a collection of the minor writings of R. Bonghi, under the title, 'Da trent' anni'; 'Parini,' by Giosuè Carducci; and the fifth volume of Giuseppe de Leva's History of Charles V.

As may be inferred from its title ('La Fe'), religious complications form the staple of Valdés's latest novel (Madrid: M. G. Hernández). As would also be inferred by any one familiar with the previous writings of the author, of whom it has been justly said by a Spanish critic that he "always writes a trifle *à la diable*," the religious struggles of the priestly mystic who attempts the conversion of an atheist, only to find himself infected by the very doubts he is combating, are not given a profound and convincing representation. However, the scene is laid on Valdés's native heath, and his book adds many more to his vivid pictures of Asturian life. A translation of the story, 'Faith,' by Miss Hapgood, comes to us from the Cassell Publishing Co., but it is marked by haste in preparation throughout, and the translator's slips have been aggravated by printer's errors. In the very first chapter we note the following: "saw herself obliged to feel upon her the feet of Osuña the humpback" (p. 1), should read, "saw herself obliged to sit upon the feet," etc.; on p. 29, in place of "robbed the earthen jar, in the corridor of the rectory, of eggs," should stand, "stole grapes from the trellis along the corridor"; and for "he smelled his powerful breath, and, ducking suddenly, at the moment when the latter was on the point of clutching him, he succeeded in dodging the blow, and pitching headlong on the altar," read, "he perceived his labored breathing, and . . . succeeded in making the blow miss its aim and his assailant fall headlong against the altar."

In addition to a mistimed, blank-cartridge campaign biography of the ex-Secretary of State, 'An American Statesman: the Works and Words of James G. Blaine, Editor . . . and True Patriot,' by Willis Fletcher Johnson (Philadelphia: A. R. Keller Co.), we have two volumes in illustration of the Democratic nominee, viz.: 'Principles and Purposes of Our Form of Government, as set forth in Public Papers of Grover Cleveland,' compiled by Francis Gottsberger (New York: George G. Peck), and the fuller 'Writings and Speeches of Grover Cleveland,' selected and edited with an introduction by George F. Parker (Cassell Publishing Co.). The latter work is provided with a very inadequate portrait.

Mr. Joseph Pennell, in 'The Jew at Home: Impressions of a summer and autumn spent with him' (Appletons), makes, no doubt, a sincere effort to continue his well-known rôle of simple delineator of the picturesque; but his letters of last December to the *Illustrated London News*, here reprinted with the original pen-drawings and with a controversial preface, are obviously a tract against Jewish emigration, to the author's native America particularly. There is a medley of what he has seen, which we may trust implicitly; what he has heard, which we may trust in the main; and what he has not seen or heard, but generalizes fearlessly about, with the confidence of a car-window observer, philosopher, and statistician. In short, Mr. Pennell could not content himself with mere description. His little book is worth reading, for the reflections to which it gives rise are not wholly those intended by the author.

We may notice together Mr. Charles Booth's 'Pauperism, a Picture; and the Endowment of Old Age, an Argument,' published by Macmillan, and the Rev. J. Frome Wilkinson's 'Pensions and Pauperism,' published by Methuen & Co. Mr. Booth's book is an expansion of the paper read by him last December before the Statistical Society, which excited such general interest both in this country and in England that it is unnecessary to comment upon it. Those who are acquainted with Mr. Booth's methods as shown in his other books, know that he is thoroughly conscientious and not carried away by Socialistic illusions, and will listen, if not with interest, at least with patience to his detailed argument. We consider that this argument fails at a vital point, but Mr. Wilkinson is converted by it. He has distinguished himself by his sturdy opposition to State pensioning schemes, and by his brilliant presentation of the case of the Friendly Societies in England. He is convinced, however, that Mr. Booth's plan can be worked without discouraging the spirit of self-help. We trust that it may be true, for it looks as if some arrangement for State pensions would be adopted in England, and, if the experiment must be tried, Mr. Booth's device is the best yet presented.

Under the title, 'Criticisms on "General" Booth's Social Scheme,' the Salvation Army plan of regenerating the degraded is attacked from several quarters. These criticisms are sufficiently destructive, but as General Booth has just announced that he must have £30,000 this year unless his plan is to prove a failure, while he has only £6,000 in hand, further criticism may be superfluous. The book is published by Swan Sonnenschein & Co. and imported by the Scribners.

The first edition of Prof. Edwin J. Houston's 'Dictionary of Electrical Words, Terms, and Phrases' (New York: W. J. Johnston Co.) has already been noticed in these columns with a certain amount of commendation. It appeared as a duodecimo volume, and was well received by the electrical world. The large octavo before us contains, as stated in the preface, more than double the matter and about twice the number of definitions which appeared in the earlier work. The book holds an intermediate position between a dictionary in the limited sense and an encyclopædia, and the author has endeavored by cross references to make it also serve the purpose of a text-book. The definitions are necessarily concise, but are usually clear and sufficient, the defects of the first edition having been corrected. There is, however, still room for improvement, and it sometimes happens that clearness is sacrificed to conciseness. In reading the work, one cannot fail to be impressed by the wealth of the electric vocabulary and the great number of terms, names, and words which the science of electricity in its various branches now requires in order to be intelligible. The intrinsic vastness of the science also appears in such a work more plainly than in any text-book. In his preface the author asks for friendly criticism. His work, if not perfect, is still a most valuable addition to our resources for reference and even for study. It cannot fail to receive a cordial and appreciative welcome.

Teachers of German will be glad to have their attention called to Book III. of Schiller's 'History of the Thirty Years' War,' abridged and edited with notes by Karl Breul, lecturer in German at the Cambridge (Eng.) University; and a new edition of Hamann's Lessing's 'Laokoon,' revised by L. E. Upcott —both on the list of Macmillan & Co., and the former in Gothic, the latter in Roman characters. For advanced pupils two little pocket volumes from the "Sammlung" of G. J. Göschen, Stuttgart, are also recommendable, being annotated in German. These are a selection from the *Minnesang* and *Spruchdichtung* of Walther von der Vogelweide, edited by Prof. Otto Güntter; and corresponding selections from Hartmann von Aue ("Der arme Heinrich"), Wolfram von Eschenbacu ("Parzival"), and Gottfried von Strassburg ("Tristan und Isolde"). The Roman character is here, too, employed, and each volume is provided with a glossary.

Much ingenuity is displayed in the 'English-French Conversation Dictionary,' by Richard Jäschke (Boston: Carl Schoenhof). Under *bill of fare* we have a list of edibles filling four pages; under *billiards*, the technical terms, followed by conversation on the subject; under *cards*, the same for piquet and whist. Other fruitful headings are *time* and *times*, *numbers*, *note* (in music), *post-office*, *shoemaker*, *train* (very well imagined), *theatre*, *thermometer*, *weights*, etc. There is also a showing of verbs, regular and irregular, and a vocabulary of such French words as are likely (to quote the compiler's slip in idiom) "to occur to the traveller"—*i. e.*, to meet his eye. Finally, a page is devoted to the pronunciation of some more or less difficult proper names.

Broglie is there set down as "Bro-ih," though for the French eye the pronunciation is Breuil.

Any sign of the growth of the study of Italian in this country is welcome. Mr. C. H. Grandgent's Grammar of that language has called for a Composition, which he now supplies (Boston: D. C. Heath & Co.). Some of his English selections for exercises are taken from Howells, Beecher, Henry James, and the newspapers. There are formulas for letter-writing, lists of verbs, notes on pronunciation, and a brief account, from the author's early observation, of inflections of the voice. The exercises are accompanied by vocabularies.

Mr. Paul E. Laur writes, in the Johns Hopkins Historical Series, an essay on "Church and State in New England," which is a study of the development of religious liberty apart from general history. In this way room is obtained for many details of more or less interest, but we do not observe that anything material is added to our knowledge of the causes or effects of the establishment of religion by the State.

Much the same may be said of Mr. C. H. J. Douglas's study of the financial history of Massachusetts, published in the Political Science Series of Columbia College. Even the professional economist cannot find the particulars that Mr. Douglas has gathered especially profitable, while the student of general history is sufficiently informed of the course of our forefathers in dealing with finance by existing authorities. While there may be some advantage in bringing together the facts bearing upon the treatment of the problem in the past, such collections are generally useful only as materials for history, and must be presented with exceptional skill in order to command attention.

Mr. F. M. Crunden's annual report of the St. Louis Public Library (for 1890-91) is, as usual, effectively put together. The library has, he says, the enviable distinction of being "the only large library in the country that has received no gifts of any importance, either in money or books, from private sources." Some very curious examples are given on pp. 22-26 of reference lists furnished to applicants, of books or articles wanted of the librarian, and of questions asked him. Instructive, too, is the account of the reading-club formed, in connection with the library, in a colored school of the city, with samples of "the formal written reports that have been presented on books read."

Commissioner Swan's fourth report on the custody and condition of the Public Records of parishes, towns, and counties in Massachusetts has, like its predecessors, a universal application. Mr. Swan urges that "the office of [town] clerk must be removed from politics and put on a business basis," independent of fees, with a salary from both the town and from the State, which imposes a vast deal of labor upon this officer. The recklessness of these attributions, and the general disregard of the statutes relating to the public records, are a lesson in the art of legislation. The copying of perishing early records enjoined by law should, as Mr. Swan shows, be intrusted only to experts. It is, by the way, a good illustration of the working of Massachusetts ideas that the Commissioner has a volunteer assistant in the person of the editor of *Putnam's Monthly Historical Magazine* (Salem), who, in his June number, states that he too is collecting statistics from the town clerks regarding the records of churches, parishes, etc., their condition and present custodian; and offers "to print any hitherto unpublished early records free of cost," from a good copy or from the original. The Salem Press Publishing and Printing Company bespeaks the printing of town records, and has been employed for that purpose by the town of Manchester.

The opening paper of the *Scottish Geographical Magazine* for June is by Dr. H. Schlichter, on the "Pygmy Tribes of Africa." He divides these into four groups—viz., those inhabiting West Africa, the Central regions, East Africa, and the territory south of the Congo. Of the existence of the third group there is no definite knowledge, but he produces strong testimony of many travellers to show that a race similar to that seen by Stanley in the Congo Forest inhabits a still unexplored portion of the Galla country, to the east of the Upper Nile. The Rev. James H. Lawrie gives an interesting account of the customs and folklore of the New Hebrideans; in the latter there is some resemblance to the Biblical stories of the Deluge and of Jonah. The Russian Kurds are treated in a similar manner, the material being taken from an official report upon their condition.

The last Bulletin of the Société de Géographie contains the conclusion of M. Ch. Maunoir's elaborate review of the progress of geographical research during the year 1890. Referring to the fact that the work of the original explorer is nearly finished, and that the time is approaching when the words *terra incognita* will disappear from the maps, he briefly indicates the task of the future geographer. This will be the filling in the outlines, getting an exact knowledge of what is still imperfectly known, and investigating the structure and life of the ocean beds. Historical geography, especially, will receive a new impulse, as in the bringing into full light the vast ruins still almost hidden under the sands of Asia and in the forests of Africa, and causing them to reveal the names and history of their builders. A good illustration of this latter work is to be found in the *Bulletin* in the attempt of M. G. Marmier to give new solutions of certain obscure questions of ancient Syrian geography in connection with facts in Old Testament and Egyptian history. There is also a sketch of ten years' geographical and ethnographical work in French Guiana, accompanied by a series of maps, by Henri Coudreau, and a report upon the Geological Congress at Washington by M. Emm. de Margerie, one of the three foreign secretaries. Baron Nordenskiöld contributes a short account of an expedition to Spitzbergen commanded by his son, Gustav, in which he speaks of snow on the mountain sides colored so intensely red by some minute algæ as to be discernible at a distance of more than twelve miles.

We have before us the first number of a new monthly, the *American Journal of Politics*, defined as "a magazine for intelligent men and women who read and think on vital questions of the times." The editor is Andrew J. Palm, and the place of publication at 938 Temple Court, in this city.

The conductors of *Babyhood* have found it expedient to exchange this title for its definition, and it will henceforth be known as the *Mother's Nursery Guide*. This useful and genuine publication has reached its ninety-second number in vol. viii.

The fifth annual meeting of the American Economic Association will be held at Chautauqua, N. Y., on August 23-26. The farmer, his discontent and his "movement," will have a session to themselves (evening of Aug. 24), as well as some consideration in the morning of the same day.

—The July *Atlantic* contains a short and bracing paper, by Theodore Roosevelt, in regard to the levying of political assessments in the coming campaign. He describes succinctly the state of the law, forecasts the action of political managers and Government employees, and assures both that the Civil-Service Commission will be vigilant and will investigate, either on open or confidential information, all suspected offices, and will do its utmost to secure observance of the law and punishment of offenders. The article is of the nature of an unofficial circular letter, and will be read with satisfaction by civil-service reformers. The general contents of the number are of varied and equal interest, no one contribution being especially conspicuous. The idealists have it all their own way in two articles. The first is one of generalities on "The American Idealist," by Gamaliel Bradford, jr., in which he endeavors to show that our countrymen are more given to the idealistic temper than are the English. He cites Emerson, of course, as the type, but he was hardly national; on the whole, too, the paper is somewhat over-full of Arnoldisms. The second is a first paper on Shelley's "Prometheus Unbound," by Vida Scudder, and undertakes to show that Shelley was a true myth-maker and represents that primitive stage of thought-creation. This is certainly a fanciful view, but it serves to bring out certain aspects of Shelley's work, and to free it from the religious prejudice which has not ceased to operate against the appreciation of his poetry. Both writers seem to agree in denying that Shakspere was an idealist—one of the effects, we take it, of the attempt to set up Browning as a latter-day Shakspere; but it would be well if writers of this order would begin by definitions, so that readers may know what they mean by such classification. Other papers of interest are on McClellan, Chicago, and the Greeks in the Persian War.

—*Harper's* celebrates the anniversary of our independence by an account of how the Declaration was received in the old thirteen States, illustrated by cuts in consonance with Revolutionary days. Lowell's Elizabethan criticism goes on with Marlowe, and sets forth his genius by selections, with an effect as great as Lamb's similar work, and fortified by a judgment which far exceeds the power of the leader of the literary revival which ends, in all probability, with the present series, as its recreative energy was spent long ago. The growth of the Federal Power is described after the well-worn style by Mr. Nelson, and the usual lessons are drawn from the history; but the conclusion that the use of this power should now be determined by economic instead of constitutional reasons, deserves notice, perhaps, as an opinion. Mr. Brander Matthews rides a course against the "Britishers" in defence of American spelling, if so aggressive a paper can be properly spoken of as a "defence." We are not quite sure from his words whether he does not regard all spelling as equally bad, in accordance with a recent opinion of Prof. Child; and in such a case the omission or alteration of a letter or two is a small matter, since it tends to uniformity by such infinitesimal progress; but he makes it plain that "colonialism" in spelling is at an end, and if, as he quotes from Sainte-Beuve, "orthography is the beginning of literature," there is a mite, at least, of hope for that "literary indepen-

dence" which is so much desiderated in some quarters. An unusual travel sketch is contributed by R. Caton-Woodville, who describes the capturing of wild elephants in Mysore on the occasion of the late Prince Albert Victor's visit to India.

—The writer in *Scribner's* who undertakes to give an account of the poor of Chicago seems to have had great difficulty in finding any of the sort wanted. There are no tenement-house districts, no real ghettos, no aggregations of hopeless poverty in special quarters such as are to be met with in older cities; and his report goes further than this, to show that the want and suffering in the lower classes of Chicago are brought about not by social or economic disadvantages, but by drink. The city, nevertheless, has its poor, who are cared for individually, it appears, but the percentage is small. Charitable effort is directed rather toward moral than physical aid, and the institutions which help the young to make right choices and to raise their standard of life and conduct, are well supported and thriving. An artistic paper upon Ravenna, a scientific one on the depths of the sea, and one of very practical use on city squares are the other leading pieces.

—The contribution of the highest interest in the *Century* is the continuation of the description of the plans for the World's Fair at Chicago, with abundant illustration of the architectural features, which supports the common expectation that the success of the enterprise in artistic effect is assured. A second art contribution is the sketch of Daubigny and his work, also illustrated with great richness. Dr. Waldstein writes a full narrative of the discovery of the tomb of Aristotle, certainly one of the most interesting results of the work of Americans in Greece; and though he does not assert that the ascription of the tomb to the great philosopher is beyond doubt, he regards the proof as sufficiently conclusive to establish a case against which something negative must be brought in order to destroy probability. The stock articles continue, and the number winds up with a statement of what the Government is doing for the farmer, which shows that he is certainly not a neglected individual in the paternalism which belongs to our system of the public good.

—History is repeating itself with significant regularity at the English women's colleges. In the Moral Science Tripos at Cambridge, a Girton student, Miss Read, has just taken higher honors than any male student, while Newnham, in her turn, bears her honors no less thickly than her sister college. One of her students, Miss Block, has defeated all men in the Mediæval and Modern Languages Tripos. Both colleges have again won the distinction of having students in the first division of the first class of the Classical Tripos. One of these fortunate winners of the highest obtainable classical honors is from Australia, another is the daughter of the late headmaster of the City of London School, Dr. Abbott, who is best known to the world at large by his 'Shakespearian Grammar.' It is needless to moralize on the fact that none of the five women students who have just proved their classical prowess has had the discipline of the ancient nurseries of honor students, Eton and Rugby; but it is worth while to call to mind that when the women's colleges were first started at Cambridge, not even their warmest advocates dared to dream of first-class honors in classics until a comparatively distant future, when their students should have had a training equal in duration and severity to that of the great public schools.

—The thirty-first part, printed May 14, completes volume three of J. B. Halvorsen's 'Norsk Forfatter-Lexikon,' bringing the work through the letters I to L. This volume shows no diminution of the author's remarkable thoroughness and accuracy; and his critical judgment and sense of proportion seem at fault in a single instance only—in allotting six pages to Hans Henrik Jæger, who obtained a considerable, but unenviable, notoriety in Norway by printing a book entitled 'Fra Kristiania-Bohêmen,' which was suppressed because of its obscenity the day after publication. The author was imprisoned for sixty days, and made to pay a fine of 80 crowns, and, upon a second time printing a portion of the book, was again sentenced to 150 days' imprisonment and a fine of 1,600 crowns. Mr. Jæger's appearance can hardly be considered of special importance in the history of Norwegian literature, and while the account of his book and the various judicial and other proceedings which followed its publication is interesting, the space allowed to it is excessive; the more so, as Mr. Halvorsen does not even mention the name of another realistic author whose work—of greater literary merit than Mr. Jæger's—was confiscated the following year. Of writers whose fame has extended beyond Norway, this volume includes the critic, Henrik Bernhard Jæger (not to be confounded with the Jæger mentioned above); the geologists, B. M. Keilhau and Theodor Kjerulf, and the latter's brother, the composer, Halfdan Kjerulf; the Orientalist, Christian Lassen; and the Egyptologist, Jens Daniel Carolus Lieblein; and the popular novelists, Alexander Kielland, Jonas Lie (who occupies twenty-two pages), and Kristofer Janson, who has a special claim upon the interest of Americans because of his coming to the United States in 1881 and settling in Minnesota as an American citizen, after having attained sufficient prominence in his native country to be awarded a poet's pension by the Norwegian Government.

—But the place of honor is allotted to Ibsen, an admirable biographical and bibliographical record of the poet, up to November, 1889, filling the first eighty-nine pages of the volume. The biographical notice, extending to more than thirty pages, is rendered especially valuable by the good judgment shown in omitting details commonly known, and including a great deal of important information not otherwise readily accessible, so that it will doubtless always remain a convenient source of reference. The bibliographical record shows that Ibsen had published, between 1850 and 1888, eighteen books, of which all but four had reached a second edition, while nine had attained to a third, seven to a fifth, four to a sixth, and three to a seventh; and of one ('Brand') the eleventh edition was issued in 1889. Since Mr. Halvorsen's record was printed, it is probable that some of the volumes have reached still higher editions, while another book, 'Hedda Gabler,' is to be added to the list. All of these works have been translated into German, several of them more than once; and in the case of 'Brand' no less than four distinct German translations were published in six editions. Next to the German, the English translations have been most numerous, fourteen of the above nineteen books having been published in the English language, several having appeared in more than one translation, and all but two of them within two or three years. Besides the lyrical poems, the following four works, only, remain to appear in English dress: 'Catalina' (Ibsen's first book, published in 1850), 'Gildet paa Solhaug' (1856), 'Kjærlighedens Komedie' (1862), and 'Peer Gynt' (1867). Four plays have appeared in Finnish translations, three in Swedish, two each in French, Polish, and Dutch, and one each in Russian, Bohemian, and Italian. In Ibseniana the record is noticeably voluminous when it is remembered that the subject is still living and hardly at the zenith of his fame. More than a dozen biographical and critical works on Ibsen are recorded, and the magazine contributions in this class number several hundreds. Of special interest is the information given concerning the stage representations of Ibsen's plays in the chief cities of the world.

PARKMAN'S HALF-CENTURY OF CONFLICT.

A Half-Century of Conflict. By Francis Parkman. Boston: Little, Brown & Co. 1892. 2 vols., pp. viii., 333; viii., 395.

THESE two volumes are the completion of a memorable undertaking. The task to which Mr. Parkman set himself forty-five years ago, with results that began to appear in this series in 1865, was one of the most important to which an American historian could devote his pen. Its successful accomplishment is a fact sufficiently significant in itself, and is rendered doubly remarkable by the condition of health against which the author has had constantly to battle. Mr. Parkman's painstaking research has earned for him a permanent place in the front rank of American writers of history, while the brilliancy of the style in which his thought is clothed imparts a charm to his narrative unsurpassed by that of Prescott or Motley. He may well look back with satisfaction on the stately series of volumes in which he has narrated the great attempt to plant on American soil the civilization and institutions of royal France—a drama heroic and tragic enough to claim the admiration of those who most sincerely rejoice that it ended in essential failure. The struggle which he records is one of types of civilization, both foreign to American soil, of European origin, yet developing in full fruitage here and meeting in necessary conflict. It is this contest of ideas which were the slow growth of centuries in Europe, that gives to the pre-Revolutionary epoch in American history its chief fascination, and in a large degree renders its study valuable. Doubtless the tendency of American writers of history to dwell on the colonial period has been excessive, but it has much justification in the fundamental nature of the problems which the seventeenth and eighteenth centuries worked out. That the character of many of those problems is so clear to us, and the reasons of their solution so apparent, is due, in no small measure, to the life-work of Mr. Parkman.

The two volumes before us fill a gap in the series, constituting the sixth part of the seven divisions into which Mr. Parkman has separated his history of "France and England in North America." That their preparation was delayed till the final struggle had been told shows that the period of which they treat was less important, in the author's estimation, than the years which precede and follow. It is an epoch, also, which has been more fully handled by other historians than the times with which some of Mr. Parkman's other volumes have to do. It was not conspicuously marked by

events of lasting consequence, nor was it possible to give to this period the unity of interest which marks the story of the 'Jesuits in North America,' or the 'Discovery of the Great West.' La Mothe-Cadillac, the founder of Detroit, is far from the peer in interest of Champlain or La Salle; the missionary Rale is but a poor substitute for Brébeuf or Jogues; nor is Vaudreuil a governor to attract the fancy like Frontenac. This comparatively intermediary character of the period is frankly recognized by the author, who declares that "the nature of the subject does not permit an unbroken thread of narrative, and the unity of the book lies in its being throughout, in one form or another, an illustration of the singularly contrasted characters and methods of the rival claimants to North America" (Preface, iii.).

The modest claim of the writer is fully justified, and in spite of the relatively minor importance of the events narrated, the story is one of great interest. Whether it could have been so picturesquely told by any pen but that of Mr. Parkman may be doubted. Under his touch, thanks to his vivid use of episode and detail, the characters stand out as portraits of living men. A good illustration of this graphic method, by which a few strokes indicate the whole picture, is seen in his treatment of the much harassed border settlements of Maine during the war of Queen Anne. The Indian raids were incessant and monotonous, but no enumeration gives half so vivid a conception of what the border life was in those hours of trial as the story of Plaisted's wedding (i., 48–51). In a similar way, the familiar narrative of the sack of Deerfield in 1704 serves as an illustration of the larger expeditions of the French and Indians, and under Mr. Parkman's facile pen the whole heroic, tragic border tale seems as of yesterday (i., 52–89). But Mr. Parkman is more than a skilful narrator of past events. He points out most clearly the object of the French authorities in these border raids, which seem so purposeless: "The aim of the enterprise was not military, but political. . . . The object was fully to commit these savages [the Abenaki] to hostility against New England" (i., 52). The French, with their smaller population, were constantly fearful lest the Indians of northern New England and even the converts settled in Canada, drawn by the superior quality and cheapness of English goods, should be induced to become neutral or side with the English; and hence they incited their Indian allies to onslaughts which made New England border life precarious in the extreme without seriously crippling the English colonies (i., 45, 52, 96, etc.).

The contrast between French and English methods of colony building is everywhere markedly brought out, but perhaps its most interesting illustration is in Mr. Parkman's account of Acadia before and after the conquest by the English in 1710. The direct dependence of the officers on the home Government, the lack of all initiative and responsibility in the colony itself, led to constant bickerings among its rulers, and to endeavors to supplant one another by appeals to the Ministry in France. Even so petty a question as precedence in lighting a bonfire became a subject of grave appeal to the Government of Versailles (i., 111). On the other hand, the English, after the conquest of the province, seem almost to have forgotten its existence. An insignificant garrison at Annapolis was all that maintained the English authority in the face of a constantly increasing French population, unceasingly plied by French agents whom the weak English representatives were unable to prevent. In the end the Acadians themselves bore the brunt of this mistaken policy. As Mr. Parkman points out, this non-interference on the part of the English home Government, which worked so much to the advantage of the New England colonies, simply allowed French emissaries to sow disaffection among the Acadians till they became a danger great enough to rouse English apathy. But a little firmness after the conquest, or a little conception of the prize which the English had won, would have saved the melancholy deportation of 1755. Not the least interesting of the documents which the author has gathered in his appendix are the letters of Gov. Shirley of Massachusetts to Newcastle at a later period (1745–7), showing that Shirley's eyes were fully open to the peril of the Acadian situation, but that his complaint and suggestions were addressed to deaf ears (ii., 321–360).

Mr. Parkman retells the siege of Louisburg in graphic fashion. The foolhardy character of the enterprise, the enthusiasm with which New England embarked on it, the bravery of the raw New England troops, their nearly fatal want of discipline, and the remarkable good fortune which secured them the victory, stand out conspicuously in his narrative; and it is lighted up, as is all of Mr. Parkman's writing, by personal incident and familiar description of the scenes in which the action took place. The story from its English side is already familiar, but Mr. Parkman has brought to its illumination, as usual, the French accounts, extracts from two of which, the curious *Lettre d'un Habitant de Louisbourg*, and the report of the governor of the fortress, Duchambon, are given in the appendix. Without very materially altering the English story of the siege, they add many touches of value to the picture. But, as Mr. Parkman shows, the Louisburg success was, from a military point of view, an undeserved victory due to a remarkable combination of favoring circumstances. The two rival civilizations were unlike in nothing more than in military efficiency. In general the military superiority was on the side of the French:

"If the English colonies were comparatively strong in numbers, their numbers could not be brought into action; while if the French forces were small, they were vigorously commanded and always ready at a word. It was union confronting division, energy confronting apathy, military centralization opposed to industrial democracy; and, for a time, the advantage was all on one side" (ii., 65).

The rulers of Canada were usually men trained to military service in Europe, and they found valuable material for soldiery in the hardy Canadians, accustomed largely to forest life. Their form of government brought with it no inconvenient debatings and divisions of authority. The English colonists, on the other hand, though usually excellent fighters in small numbers (as Mr. Parkman abundantly shows in his account of Lovewell's expedition against the Pequawkets, and the defence of Charlestown and of Fort Massachusetts), seldom accomplished much in large bodies. They were too democratic to be readily disciplined, their officers were largely chosen for personal popularity and had no experience in war, and the whole colonial system of local independence and discussion by legislative bodies was almost fatal to efficient action. Nor were the English forces which were occasionally sent to the aid of the colonists during the period included in these volumes as well led as they might have been. If Warren supported the New England soldiery efficiently at Louisburg, the story of the attempted capture of Quebec in 1711 by an expedition under Admiral Walker, relatively stronger than that which effected the conquest under Wolfe, is one of failure due to miserable incompetency.

This difference between the two civilizations in America, shown in their military efficiency, is also illustrated in the degree of appreciation of the possibilities of expansion which the continent held out before them. Doubtless the natural route to the interior of the continent which the St. Lawrence and the great lakes opened to Canada had something to do with the superior clear-sightedness of the French officials; but, as Mr. Parkman says, the

"English communities took little thought of the region beyond the Alleghanies. Each lived a life of its own, shut within its own limits. . . . If the English-speaking populations flowed westward, it was in obedience to natural laws, for the King did not aid the movement, the royal governors had no authority to do so, and the colonial assemblies were too much engrossed with immediate local interests. The power of these colonies was that of a rising flood, slowly invading and conquering, by the unconscious force of its own growing volume, unless means be found to hold it back by dams and embankments within appointed limits.

"In the French colonies all was different. Here the representatives of the Crown were men bred in an atmosphere of broad ambition and masterful and far-reaching enterprise. Achievement was demanded of them. They recognized the greatness of the prize, studied the strong and weak points of their rivals, and, with a cautious forecast and a daring energy, set themselves to the task of defeating them" (ii., 64, 65).

This out-reaching inclination of the French Canadian genius had its chief exemplification, of course, in the great explorers whom Mr. Parkman has commemorated in his 'Discovery of the Great West'; but they were worthily succeeded in the period covered by these volumes by Varennes de la Vérendrye and his two sons. Their efforts to reach the Pacific, and the expedition which took the sons in 1742-3 to the Bighorn Mountains in Wyoming, are told by Mr. Parkman with a degree of local coloring which comes from his own familiarity with Rocky Mountain life before those solitudes had become the abodes of white men.

In a work of such sterling merit, it is almost ungracious to point out one or two trifling slips of the pen or of the proof-reader. But the next edition may correct the following: The name of the Massachusetts Governor should be given as Phips, not "Phipps" (i., 149)—it is correctly spelled elsewhere; the name of the same place is printed "Dunquerque" (i., 181) and "Dunkirk" (ii., 83).

RECENT POETRY.

It is a curious coincidence that the reprinting of Mr. William Watson's simple and thoughtful poem "Wordsworth's Grave"—forming a part of his volume called 'Poems' (Macmillan)—should have coincided with the appearance of a whole group of poems by English authors, each of whom has utterly turned his back on both Wordsworth and Watson and is resolutely seeking something quite opposite. The younger poet here says of the elder (p. 136):

"Not Milton's keen translunar music thine;
Not Shakespeare's cloudless, boundless human view;
Not Shelley's flush of rose on peaks divine;
Nor yet the wizard twilight Coleridge knew.

"What hadst thou that could make so large amends
For all thou hadst not and thy peers possessed,
Motion and fire, swift means to radiant ends?—
Thou hadst, for weary feet, the gift of rest."

But when we look over the pile of contemporary volumes by English poets—turning

from Morris to Meredith, from Kipling to Henley, from Edwin Arnold to Lord Lytton—the one thing conspicuously wanting through the whole series is that rest which can only be born of simplicity. William Morris, in 'Poems by the Way' (Roberts Bros.), is supposed to speak for the age, to represent the thoughts and hopes of the people, for the coming time, and this is the way he does it (p. 26):

"Grey grows the dawn while men-folk sleep,
Unseen spreads on the light,
Till the thrush sings to the colored things
And earth forgets the night.

"No otherwise wends on our Hope:
E'en as a tale that's told
Are fair lives lost, and all the cost
Of wise and true and bold."

There is not even what Mr. Watson calls "motion and fire" in this: it is dull, and drags itself along; and it is in a key as false as that struck by Morris in prose fiction, where he describes a future society in which all the railways in England shall have been removed, and the wise and good shall go out with timbrels and dances from London, every year, to make hay upon the Thames and rejoice in the downfall of matrimony. Mr. Obadiah Oldbuck, when he decided to become a farmer "under the provisional name of Thyrsis," was not more remote from all simple and genuine emotion than that reflected in this book from beginning to end; and when we compare it even with the terse vigor of some of Mr. Morris's earlier work—"The Death of Paris," for instance—it is impossible not to feel that he now represents a downward and not an upward grade in thought and art.

In George Meredith's 'Modern Love,' there is of course no want of occasional terseness and vigor, though there is always the false note in the background, varied and distributed by individual whim. It is a curious result of the new Copyright Law that there appear two different reprints of this work, one published, with a few additional poems, by Roberts Brothers, Boston, and the other, with an expository prelude, by Mrs. Cavazza, from the house of Thomas B. Mosher, Portland, Maine. The preface, though tinged with that peculiarly rhetorical style which suggested to some one in England the word "Meredithyrambics," is yet a positive help towards the understanding of an exceedingly unpleasant poem—so careless of form that it is couched in sixteen-line verses called by Mr. Swinburne "sonnets," and so heedless of rhyme that it couples "foot" and "mute"—but more unattractive in subject than in form. It has, of course, plenty of those vigorous phrases in which its author is so strong, as (iv.):

"Cold as a mountain in its star-pitch'd tent
Stood high Philosophy, less friend than foe."

On the other hand, we may come at any moment on such a crude ecstasy as this (xiii.):

"When the renewed forever of a kiss
Sounds through the listless hurricane of hair."

Or this, which is worse (ii.):

"A star with lurid beams, she seemed to crown
The pit of infamy; and then again
He fainted on his vengefulness, and strove
To ape the magnanimity of love,
And smote himself, a shuddering heap of pain."

This recalls Lewis Carroll's lady on the beach, with the large bonnet, who was left a monument of woe.

It may or may not be the direct influence of George Meredith, but some of the younger English writers show marked traces of his sway. This is especially true of W. E. Henley, whose 'Song of the Sword, and Other Verses' (Scribners) affords a distinct disappointment. His earlier poems, especially those written in hospital, showed a fine and acute perception, which seems now to be passing into that mere crude vigor which suggests weakness rather than strength. There is nothing in his poem of the Sword to suggest that he has ever personally handled that weapon; and through the whole volume there is a tendency to revert from steel to iron, and to treat as babyishness all finer thought and feeling. This is strikingly manifest in what must be regarded as the most repulsive of the poems, that beginning "As like the Woman as you can" (p. 60), in which he heaps contempt upon all effort at refining personal passion, and invokes Deity itself to laugh at such attempts. The slightest disposition to introduce feminine attributes into manly character seems to drive him frantic; and yet there is a widespread belief in Christendom that this combination has at least once been seen on the earth, and with results that promise a slow transformation of the race. Mr. Henley's whole philosophy on this point seems rather like that of a discontented monk than of a thoroughly manly person, and we gladly appeal from him to a much more gifted Scotchman—the author of 'The Little Minister'—who says that "strength, instead of being the lusty child of passions, grows by grappling with and throwing them."

'Ballads and Barrack-Room Ballads,' by Rudyard Kipling (Macmillan), contains but few poems not previously known, and none so fine as "The Galley-Slave," which is unaccountably omitted. The author's stock in trade is now familiar, and his verses rarely have that effect as a whole which was sometimes exerted by fragments of them, when prefixed to his stories. The "garlic flavor," as it has been called, remains the same. It is a pleasant touch of manly feeling that the volume is dedicated to Wolcott Balestier.

Sir Edwin Arnold has formerly shown himself, in "The Rajah's Ride," a much more effective master of what may be called the Oriental ballad than Mr. Kipling; but his new volume, 'Potiphar's Wife,' will not greatly add to his reputation. It will doubtless, however, have a wide American circulation at least; for the author has always been popular here, and during his lecturing tour made many friends and few enemies. The staunchest of Englishmen in his political opinions, and holding more faithfully than any one to what were reproached as "jingo" doctrines under Beaconsfield, he shares with that great leader something quite un-English in temperament, and from the moment he stepped upon the platform trod it with the ease of a Frenchman and the suavity of an Oriental. As time has gone on, he never again has struck notes so deep as in "He and She," and "He who died at Azan"; but deep notes are not always the way to popularity, and though his later verse may be called meretricious, he still holds his following of readers.

In Mr. William Sharp's 'Flower o' the Vine' (Webster & Co.) we have the conditions reversed: a promising English poet and a too friendly American editor. The distinctly youthful quality of the poems is a propitiation, if it had not been practically disavowed by a prelude which claims Mr. Sharp as a mature artist. This provokes the discovery that 'Flower o' the Vine,' whether we suppose the phrase borrowed from Browning or from nature, is a very inappropriate designation for a volume consisting largely of Scottish poems; and that these poems themselves are not to be compared for ballad-strength and vigor to the remarkable compositions of Graham R. Tomson. Then, when we turn to the Italian half of the book, it is impossible to deny that, though the unrhymed strains have a certain vague and pleasing melody, they are yet at peculiar variance with the spirit of Italy, which—perhaps following the low lines and definite outlines of the Mediterranean shores—has always been the home of definite and highly perfected strains. From Horace and Catullus to Petrarch and his successors, there has not been one who has not been, above all things, accurate and measured in form. In vindicating his poet's name to a double-first-class, as it were, in art, Mr. Janvier, his kindly sponsor, justifies his "irregular unrhymed measure" by the Gaelic minstrel and "the gentle savages of the South Sea." But what have Northern bards or Southern savages to do by the Mediterranean? It seems to us, therefore, that while there is much in the book to attract, there is yet a want of distinct appropriateness both on the Scottish and the Italian side. It is worth remembering, however, that Mr. Sharp is one of the few Englishmen—fewer, alas! than in the last generation—who have taken a positive interest in American thought or literature; and this gives him a personal claim on our kindly regard.

It is worth while to turn from the works of what may be called, without offence, professional poets, to the volume 'Lays of Country, Home, and Friends' (Dublin: Sealy), which represents the life-work of a woman, Miriam O'Leary—the only woman admitted to the secrets of the Fenian uprising in 1865, and the sister of John O'Leary, sentenced at that time to twenty years of penal servitude. The poems, the portrait, and the memoir by Sir Charles Gavan Duffy, all show a genuine Celtic nature, impulsive, ardent, imaginative, and reinforced by a woman's capability of suffering for a brother or for a cause. The little volume is full of glowing passion and lyric spontaneousness, and belongs to that characteristic literature of Irish revolution which, as Sir Charles Gavan Duffy has said, "for more than a generation has neither been winnowed nor garnered," but has been thrown, as it were, into a huge waste-paper basket, from which very little of it will ever emerge.

Turning now to American poets, it is one of the curious phases in the varying fame of Walt Whitman that his death almost precisely coincided with the publication of that which he had persistently deprecated during life, an expurgated edition of his poems. It is perhaps a compliment to Massachusetts that the experiment should be even tried, for Mr. Arthur Stedman, the editor of 'Selected Poems by Walt Whitman' (Webster & Co.), says in his preface that "the volume is partly a concession to the spirit which banished 'Leaves of Grass' from Massachusetts." The concession is no greater than that which was made from the outset in England, and there proved the basis of his fame. As a result, it was difficult to make any one believe, in England, a dozen years ago, that there was anything of Whitman's not well suited to be read aloud in the family circle after morning prayers. It is altogether probable that the same impression will be produced in many families after the distribution of Mr. Stedman's selections; and that there may ultimately come to be two traditional Whitmans, as distinct from each other as the two Shelleys—the Shelley of the Shelley societies, and that other commemorated in 'The Real Life of Shelley.' Mr. Stedman's choice is skilfully made, and it is certainly a comfort to have an edition which may be left openly about the house. Yet it is certain that Whitman understood himself better than any of his more cautious disciples understand him, and that something

of vigor is lost by any partial representation. The most fiery and ardent part of his verse is thus excluded, the profuseness and wordiness remain; he still, as the Greek poetess Corinna said of Pindar's ode, "sows from the sack and not from the hand"; and there is the same curious deficiency shown in him, almost alone among poets, of anything like personal and romantic love. Whenever we come upon anything that suggests a glimpse of it, the object always turns out to be a man and not a woman (pp. 34, 146). In the direction of friendship, Whitman can be impassioned and even sentimental, and this does him credit; he sometimes also speaks with reverence of mothers; but of any elevated emotion toward an ndividual woman of his own age or generation, his pages are bare.

The same fault cannot be found with Mr. Horace Parker Chandler's 'The Lover's Yearbook of Poetry,' a collection of love poems for every day in the year (Roberts Bros.). It strikes us, however, as a rather commonplace collection with a rather inflated preface. It is also to be observed that though the editor freely admits translations, his rosary of poems does not borrow a single bead from "our master in love, the divine Petrarch," as Alfieri called him. On the whole, we prefer Mr. George Parsons Lathrop's love-poems, 'Dreams and Days' (Scribner), which have a fine and tender quality, rarely lapsing into commonplace. He is also the master of a peculiarly fine and imaginative strain, best seen in "The Star to its Light," which is undoubtedly his high-water mark. His patriotic and occasional poems, and his few dialect poems, are a shade less successful. Mrs. Louise Chandler Moulton, in 'Swallow-Flights' (Roberts Bros.), has the high merit which belongs to a peculiarly faithful study of the technique of her art. Her themes are somewhat monotonous; her perpetual minor key may even fatigue the reader; but it would be difficult to name a woman whose continuous and average literary execution is so good. In this respect neither Elizabeth Barrett Browning nor Helen Jackson is at all her equal; and though the book is weakened by some of the silly "English opinions" mistakenly inserted by the publisher at the end, yet these cannot cancel its value. In the opening notice, for instance, Prof. Minto points out rejoicingly that this lady has "no trace of the provinciality of tone which has hitherto prevented any American poet from attaining the first rank." What poet does this critic, then, admit to the first rank? Shakspere? If so, it is possible that even Mrs. Moulton has missed the achievement he seems to think so easy.

Mr. Henry Phillips, jr., who has already printed several volumes of translations from the Spanish and the German, now issues, for private circulation, a collection of 'German Lyrics' (Philadelphia) which has the same qualities of carefulness and felicity that he has always shown. He takes in a wide range of authors—including even the German-American Karl Knortz—but he rarely achieves that quality of positive and even haunting fascination which Longfellow and Mrs. Austin sometimes attained, and without which a long series of German lyrics becomes monotonous. Heine he here omits altogether, and this is a little like Mr. Chandler's omission of Petrarch; but Heine has been, on the whole, over-translated, inasmuch as he is, of all German lyrists, the most difficult to render. Mr. Phillips himself has also touched Heine, if we remember rightly, in an earlier collection, published in 1878.

There are, as usual, many new volumes of American minor poems. Of these, Mr. Cawein's 'Moods and Memories' (Putnams) takes the lead, for he has profuse wealth, without much depth, of tone; and he is seemingly shedding that imitativeness which so marked his earlier volumes. This collection includes some poems borrowed from them, and these have been revised here and there. The new volume by Mr. Charles Henry Lüders, 'The Dead Nymph, and Other Poems' (Scribners), sustains the promise its author had previously shown, and is made pathetic by his recent death. 'Giovio and Giulia: A Metrical Romance,' by Clinton Scollard (privately printed), seems to us less successful than his shorter poems. 'Connecticut River Reeds, blown by the Peasant Bard' (Boston: Cupples), has nothing in it quite so good as the cordial, manly face of the farmer, prefixed by way of frontispiece. The like may be said of 'A Volume of Poems,' by Mrs. M. A. B. Kelly of the Albany State Normal College; this also has a portrait so strong and so winning that it quite eclipses the poems. 'Summer Fallow,' by Charles Buxton Going (Putnams), has no portrait and hence no competitor; but it is a book whose modest aspect and subdued tone conceal a real feeling for nature and a power of deep and tender expression, as in the following, where an old, old story is told in a few strong touches (p. 6):

A MEETING.

"I can recall so well how she would look—
How at the very murmur of her dress
On entering the door, the whole room took
An air of gentleness.

"That was so long ago, and yet his eyes
Had always, afterwards, the look that waits
And yearns, and waits again, nor can disguise
Something it contemplates.

"May we imagine it? the sob, the tears,
The long, sweet, shuddering breath; then, on her breast,
The great, full, flooding sense of endless years
Of heaven, and her, and rest."

THREE BOOKS ON MUSIC.

Musiciens d'Aujourd'hui. By Adolphe Jullien. Paris: Librairie de *l'Art*. Pp. 460.

Manual of Musical History. By James E. Matthew. G. P. Putnam's Sons. Pp. 462.

Classisches und Romantisches aus der Tonwelt. By La Mara. Breitkopf & Härtel. Pp. 361.

M. JULLIEN, the eminent French critic, and author of the excellent Berlioz and Wagner biographies, has published another work which amateurs, and especially critics, will prize. It is a collection of his best criticisms on the principal musical works (French or foreign) produced in Paris during the last twenty years or more. The composers represented are Berlioz, Schumann, Thomas, Wagner, Verdi, Gounod, Lalo, Reyer, Brahms, Saint-Saëns, Bizet, and Massenet. French composers naturally predominate, and to the most fashionable of them—Massenet—no less than 74 pages are devoted. Until within a few years, Paris has been very conservative in regard to foreign works, so far at least as the operatic stage is concerned; and even in regard to new French works it is noticeable in how many cases M. Jullien has an article on the *première* at Brussels before he can record the production at the Paris Opéra. Criticism of singers and minor details is usually eliminated, and it is the composers and the fate of their works in France that are chiefly considered. When we read that it was only twenty years ago that M. Jullien could congratulate the Conservatoire on having got out of its ruts and produced a few Schumann pieces, one ceases to wonder that Brahms is almost entirely unknown in Paris. Since M. Jullien wrote on this topic, the Conservatoire has made almost startling progress toward liberalism by producing that *ne plus ultra* of modernity, an act of "Parsifal."

M. Jullien has a good deal to say about the shameful conduct of his countrymen toward Berlioz, and he notes the irony of fate in that the favorite operatic works of that ferocious Wagner-hater should have had their first adequate performances under the care of the Wagner Society, and of Conductor Mottl of Bayreuth and Carlsruhe. The "Troyens" was given completely at Carlsruhe for the first time twenty-two years after Berlioz's death. Jullien remarks on the curiously antique style of Berlioz's opera, which suggests Gluck. Some of M. Jullien's essays, especially those dealing with unsuccessful operas by Thomas, Gounod, and others, lack in interest of subject, although historians will value them. Accounts are also given of the solitary "Lohengrin" performance in May, 1887, when the mob interfered; and the last article describes the first performance of the same opera last September. As this was followed by fifty-five repetitions up to April 1, with others being added at the rate of at least one a week, and as the leading Wagner city last year was Berlin, with eighty-one performances, it looks very much as if Paris, from being a city with not a single Wagner performance, were about to be transformed, in one year, into the leading Wagner city, as far as the number of performances is concerned.

Mr. Matthew has revised his 'Manual of Musical History,' and the publishers have printed it in a more convenient form. While the first edition extended only to Mozart, the present volume brings the story of music up to date. There are some minor inaccuracies, especially in the early chapters, but not of sufficient importance to impair the utility of the book. The index is uncommonly full, and a bibliography appended to the several chapters serves as a guide to students for further research. By an unfortunate accident to the types, *O du mein holder Abendstern*, on page 383, is converted into *O au*, etc.

The name of La Mara (pseudonym for Marie Lipsius) is well known to all readers of German musical literature. From two to six editions have been printed of the five volumes of her 'Musikalische Studienköpfe,' in four of which the lives of the principal composers are briefly and interestingly told, while the fifth is concerned with women who devoted themselves to music as singers and players—the whole being little more than clever compilations of facts accessible in all libraries. 'Classisches und Romantisches,' on the other hand, bears a more original character, as it contains some interesting documents and revelations regarding Beethoven, Spohr, Marschner, Schubert, Liszt, and Henselt, which are not contained in the biographies of those composers, but have been recently brought to light, partly through the author's own researches. One of the chapters on Beethoven narrates his experiences with women, another gives a number of unpublished letters, and a third traces the haunts, at Baden near Vienna, of a composer who, by his own confession, "often preferred a tree to a man." The graves of the eminent musicians who lie buried in Viennese cemeteries are visited and described. In the chapter following, a number of letters by Spohr are printed; they are addressed to Hauptmann, and their chief interest lies in their fre-

quent reference to Wagner's early operas. Spohr was the first composer who appreciated the "Flying Dutchman," but he felt tempted to draw the line at "Lohengrin," which was already too much "music of the future" for him. He found it almost impossible to teach his orchestra how to play the "Tannhäuser" overture.

Much space is devoted to a description of Liszt's first triumphal progress through Europe. Liszt was anything but a pessimist, and he was the most successful and fêted of mortals; yet when he was asked one day whether he did not intend to write his own life, he replied: "Alas! it was more than enough to have lived it!" La Mara states that Liszt, although born in Hungary, did not speak the language of that country, and that he often remarked jocularly that "eljen" was the only Hungarian word he knew. His amiability is illustrated by an anecdote told on page 275. Rubinstein disliked autograph-hunters, and one day, when a lady asked him for his signature, he rudely handed her his card. Liszt saw this, and, noting the lady's disappointment, asked her to lend him the card for a moment. When she received it back, she found that the pianist had written on it: "et son admirateur, F. Liszt."

Of great biographic importance are the reminiscences of Schubert by one of his friends, Freiherr von Spaun, printed here for the first time. A pathetic interest attaches to them, as to almost everything relating to the most spontaneous and fertile melodist the world has ever seen. But Schubert clothed his melodies in wondrous harmonies, which were "Greek" to his contemporaries; hence he was not appreciated by them. Modest as he was, he asked a friend, only a few years before his death, if he really believed he had talent; and how little the Viennese realized his greatness is shown in this citation:

"When Vogl or Schönstein, accompanied by Schubert, sang his songs in social circles and produced a ravishing effect with them, they were literally overwhelmed with applause and thanks; but no one thought of the modest master who created these glorious melodies. He was so accustomed to this neglect that he did not care about it in the least."

A great change has taken place since those days. People are beginning to realize that a creator is greater than an interpreter.

RAMSEY'S ENGLISH LANGUAGE.

The English Language and English Grammar: An Historical Study of the Sources, Development, and Analogies of the Language and of the Principles Governing its Usage. Illustrated by copious examples from writers of all periods. By Samuel Ramsey. G. P. Putnam's Sons. 1892.

"THERE are many persons," says Mr. Ramsey in his modest preface, "who would be glad to know more about the English language than can be gained from the formal routine of the public schools, who, nevertheless, are unable to procure and read the great number of valuable works on the subject that have issued from the press within a period of fifty years. Such persons are in a position to appreciate a work taking a somewhat wider view than the common text-books, and presenting some of the more familiar results of modern philology."

For such persons a volume of 600 pages, written in Mr. Ramsey's lively style and printed in the large clear types which his publishers have allowed him, would assuredly be very valuable if it actually presented the main results of philological inquiry for the last fifty years, or if, failing this, it were at least sensible and accurate in what it did offer, and did not run counter to modern science. Unfortunately the present volume does not fulfil these requirements. It is not properly an historical study, for it again and again violates the first principles of the historical method; it is rather the note-book and scrap-book of a veteran amateur, containing, of course, much that is true and pertinent, but, equally of course, abounding in irrelevancy and error.

One is first struck by the lack of method displayed in the work. 214 pages are given to "The English Language," 352 to "English Grammar." In "The English Language" the fault in question is specially marked. This division comprises seven chapters: "The Instability of Language" (8 pages), "The Sources of English" (31 pages), "The Province of Grammar" (10 pages), "Word-Making" (41 pages), "The Alphabet" (38 pages), "Grimm's Law" (6 pages), "Pronunciation and Spelling" (77 pages). Here we have, in an "historical study" of our language, the alphabet preferred to the sources of English in a ratio of about 5 to 4, and the subject of pronunciation and spelling similarly preferred in a ratio of nearly 2.5 to 1. Yet it is only when we examine the favored chapters in detail that the enormousness of the disproportion becomes striking. In the chapter on the alphabet we hear much of picture-writing, we are informed that "the Japanese learned Chinese through the medium of Corea," we are told of "the especial alphabet of the Sanskrit language," of the cuneiform characters, of hieroglyphs, of the Rosetta Stone, the Moabite Stone, and the inscription of Eshmunazar. Much of this, however interesting in itself, has no place in a book like Mr. Ramsey's, especially when it crowds out material that would be to the purpose. Similarly, in the overgrown chapter on pronunciation and spelling, we have a quantity of useless, or at best inopportune, matter. The discussion of the irregularities of our spelling is far too long, and we could dispense with the one more system of semi-phonetic orthography that the author finds it worth while to expound. Nearly six pages, almost as many as are allotted to Grimm's Law, are taken up with a list of "anomalies of spelling and pronunciation"—the residuum left "after all that can be said in the way of general principles" has been set forth; and three pages of proper names follow. The first of these lists bristles with words that are not English at all—*Aino, cicerone, cicisbeo, concetto, çy près, estramaçon, improvisatrice, lammergeyer, reiter, zollverein*, and the like; the second contains some very queer things. Both lists seem intrusive in an "historical" treatise that can spare but 31 pages for "The Sources of English."

Such disproportion, however, though a defect in the book, would not of necessity make it unsafe, and might conceivably exist without seriously impairing its value. There is no reason why the general reader should not amuse himself with linguistic curiosities, and perhaps no serious objection to his attaching a rather undue importance to them. Our chief quarrel with the work is based on its errors, which are numerous and grave.

To begin with, the author's Anglo-Saxon is unsatisfactory. To say nothing of scores of false quantities (which we might charge to the printer, if that were all), or of such unheard-of forms as *fit, gis, tith*, for *fét, gés, téth* (which charity might ascribe to an illegible hand and a negligent proof-reader), we meet with many mistakes that betray lack of knowledge. Thus, we are informed that "Saxon abounded in compound vowels—*ae, ea, ei, ie, eo, ia*—which were varied by accents placed on one or another of the vowels" (p. 13); that "the earliest English poetry depended neither on rhyme, accent, nor measure, but on alliteration—that is, identity of initial sounds" (p. 23); and that "the Saxons retained an old rune to represent the sound of *th* in *thin* and crossed a *d* for the *th* in *then*" (p. 140). Again, the paradigm *blind*, at page 88, is far from accurate, and at p. 317 an instrumental is offered for all three genders of the demonstrative pronoun ("*thy, thære, thy*"). Further, the declension of *gód* (p. 294) is given in the weak form appropriated to the definite use, with the remark: "The Saxon took another pattern, slightly fuller, when the definite article preceded the adjective"! The strangest paradigm of all is that at p. 445, where of the six forms ascribed to the preterite indicative of *findan* two only are correct. After this we need not be surprised at Mr. Ramsey's odd translation of Cædmon's Hymn (p. 8); at his supposing that *street* and *wall* were words adopted by the Saxons after their invasion of Britain (p. 12); at his calling *dor* the Anglian form for *duru* (p. 14); at his regarding "the *ke'ow* [for *cow*] of rural New York" as "a genuine Saxon survival" (p. 13); at his having observed *oo* for *ō* "first in Sir John Mandeville, middle of the fourteenth century" (p. 165); or even at his including among "the most easily distinguishable features [of English], due in whole or in part to French influence," "the almost universal ending of the plural in *s*," and "the verbal ending in *s—goes* and *speaks* instead of *goeth* and *speaketh*" (p. 22).

Nor is Mr. Ramsey a safer guide in his etymologizing and his treatment of the history of the language in its post-Saxon stages. *Orange* is not to be classed with *(n)adder, (n)apron*, and *(n)umpire* as a word in which an original *n* "has been transferred to the preceding article," *a(n)* (page 64). There is no evidence to connect *bag* with *balg* (p. 148). A final *b* has *not* "become silent after *m* in *crumb, limb, numb*" (p. 146), for *crumb* is A. S. *cruma, limb* is A. S. *lim*, and *numb* is Middle English *nume*. The *a* in *apace* is *a=on*, not *a=one*. "*Go*," we are told, "had once a past tense, which is well preserved in the Scotch *gaed*" (p. 89); here, perhaps, the author is thinking of A. S. *gengde*, the preterite of *gongan;* if so, one would be glad to know how this is "well preserved" in the Scotch form. On the same page we read that, "as early as the time of Chaucer, *went* had completely usurped the place of *éode*"; yet Mr. Ramsey knows that there were dialects in the fourteenth century. A hard saying is that on p. 60, where, as the sixteenth *a*-prefix in English, stands "Arabic *al*, the," with the note "*apricot*, introduced by the Portuguese"; but, of the various ways in which this remark may be taken, one may devise an interpretation that will save the author's credit. This, however, we can scarcely do in the case of the note on *children*, composed, apparently, in oblivion of the Saxon plural *cildru* (p. 239). The list of "the principal strong verbs that have become weak" (p. 365) actually includes *bereave, cast, lock, smoke, throng*, and *wink*. *Would* and *should*, according to our author, "are obtained by successive reductions of the older forms *wollede* and *shullede*" (p. 375).

The scope of the work precludes excursions into literary history, yet Mr. Ramsey takes occasion to ascribe the Anglo-Saxon Gospel of Matthew to Ælfric (p. 7), and to credit to

Higden, who, he says, wrote in the time of Richard II., the well-known record about Cornewal and Pencrych which we really owe to Higden's translator, Trevisa (p. 19).

In comparative philology Mr. Ramsey is equally untrustworthy. His treatment of the Indo-European personal endings (pp. 417ff.) is a good specimen of his powers in this field. A still better sample is his discussion of the comparative and superlative terminations (pp. 295 ff.), in which Bopp's derivation of *-tama* from *-tara-ma* is cited as if it were the latest thing, and we are told that "it is held with still more confidence that *-tara* signifies *of two*, and *-tama, of several.*" After this we are prepared for the "conjecture" that the Latin *-issimus* is for *-itimus*. In Mr. Ramsey's notions of word-formation the connecting vowel plays an important part. Not content with remarking, apropos of *geogeny, geography*, and the like, that "the privilege of inserting at pleasure a connecting vowel facilitates greatly the making of new compounds" (p. 33), he illustrates his position in a passage significant enough to quote:

"We may select the syllable *voc* as a starting point. In this form it is neither noun, adjective, verb, nor adverb, but, with some slight additions, may easily become either. First attach to it the syllable *re*, and it will become *re-voc*. If written *revoke*, to suit our peculiar views of spelling, it would now be a familiar word. Without such change, we may append the syllable *bil;* but *re-voc-bil* would be too harsh without the cushion of a connecting vowel, and an *a* may be interposed; but again the habits of English spelling require us to write so much of the word *re-voc-a-ble*" (p. 68).

In concerns of modern usage Mr. Ramsey does not err so often, but even in this regard he is sometimes far from sound. Witness his perverse discussion of the history and offices of *shall* and *will*. His hostility to *shall* is curious. "Another wise saw," he remarks sarcastically, "put forth as often and as confidently, is to the effect that the prevailing error lies in putting *will* in the place of *shall*. . . . I think that the great abuse is the undue frequency of *shall*" (p. 374). "It is doubtful if any one ever says 'Shall you?' without a consciousness of putting on an extra touch of style. Still 'Shall you?' has been used occasionally for at least fifty years by authors otherwise respectable" (p. 392). Anything absurder than these dicta it would be hard to discover, even in the most irresponsible of "English grammars." The author's whole treatment of the subject is confused and illogical, betraying an absence not only of the historical sense, but of ability to appreciate the finer distinctions of linguistic usage.

We have neither space nor heart for further details. To enumerate all Mr. Ramsey's errors and hazardous assertions would be a melancholy task and would require many columns of this paper. Enough have been cited to show that his book is thoroughly untrustworthy, and to justify our opinion that it should never have been issued. If it does not sell, its failure may tend to discourage the publication of philological works. If it does sell, it will disseminate error and propagate confusion. Meantime, though somewhat depressed by the result of Mr. Ramsey's venture, we still look forward hopefully to the day when authors and publishers will understand that to write a good book on grammar or on language requires as careful scientific training as to write a good book on quaternions or on neurology.

Two Thousand Years of Gild Life. With a full account of the Gilds and Trading Companies of Kingston-upon-Hull. By Rev. J. Malet Lambert. Hull: A. Brown & Sons. 1891. 8vo, pp. xi., 414.

THE title of this book and the claims of the author are somewhat pretentious. He informs us in the preface that he has attempted to sketch in outline the origin and development in England "of that peculiar principle of association which has its typical form in the mediæval Gild," and that he has worked out this design chiefly on the basis of hitherto unpublished documents relating to the merchant companies and craft fraternities of Hull. A glance at the contents of the book shows that this claim is untenable, for the manuscripts used and printed by Dr. Lambert begin towards the end of the Middle Ages. It is clearly impossible to base the general history of mediæval gilds on such records, and, in fact, the author has made no attempt to do this, notwithstanding his assertion in the preface. The first 110 pages of the work are devoted to the origin and development of gilds—Greek, Roman, and English—considerable attention being paid to the mediæval gild merchant of England. The remainder of the book deals chiefly with the trade fraternities of Hull from the fifteenth to the eighteenth centuries inclusive. The treatise concludes with short chapters on the place of the gilds in economic history, their incorporation, and their relation to the Christian Church.

We agree with the author in his estimate of the general importance of his subject:

"The whole municipal, industrial, and social life of the Middle Ages, if we except the industry of agriculture, moved in the circle of the Gild. Not alone the public, but also the social and private, the moral and municipal interests of the townsfolk centred therein. They were very largely the Chambers of Commerce, the Friendly Societies, the Trades Unions, the Freemasonry, and in some degree the Joint Stock Companies, of times when the merchant lived in his warehouse, which was also his factory as well as his shop. . . . It is plain that to enter into the current of this ancient life is to become familiar with no small part of the true history of the people."

It is refreshing to find that English writers are beginning fully to comprehend the bearings of gilds on the general history of England. They also begin to perceive that Brentano did not say the last word on this subject, and that he is not an infallible guide. In fact, Dr. Lambert, though he cites many authorities, scarcely ever refers to Brentano. A few years ago no account of English gilds was considered worthy of serious attention which did not rest mainly on Brentano's brilliant but sophistical deductions.

But in the use of authorities Dr. Lambert is not above reproach. His data on commerce are taken from Anderson rather than Cunningham, on the Hanseatic League from Marquard rather than Schäfer or Höhlbaum, on Scandinavian gilds from Du Chaillu rather than Pappenheim, on the Berwick Gild Statutes from Smith's 'English Gilds' rather than the 'Acts of the Parliament of Scotland.' Moreover, his way of citing authorities is unscholarly and at times exasperating, owing to the frequent omission of chapter or page; and some titles of books from which he draws much material are nowhere given. For example, the single word "Luchaire" often constitutes the whole of a footnote; this is a bad way to cite an author who has written several books, all or none of which may be known to the reader. Again, "Marquardi" is frequently quoted, but we are not informed what and when he wrote; Marquard's 'Tractatus de Commercio' (1662) is presumably meant. When the author does venture to give title and page he is often inaccurate (for example, notes 60, 61, 115, pp. 59, 99).

Passing from these external matters to his treatment of the subject, it must be said that Dr. Lambert's chapters on the general history of gilds add little to our knowledge. He attempts to revive the theory of the origin of English gilds in the Roman *collegia*, but he makes out no stronger case than did Coote in his 'Romans of Britain.' His arguments, like those of Coote, do not seem to us to be convincing; the parallels which he presents do not necessarily prove a continuity of institutional life. He also revives Kemble's theory regarding the identity of the gild and the personal tithing of the frank-pledge system in the Anglo-Saxon period. He does not, however, demonstrate this identity, and it is hard to believe that the tithing—a public, compulsory institution—was identical with any private, voluntary body like the gild. But while adding little to our knowledge of the subject as a whole, many of the author's remarks on the general history of gilds exhibit independent judgment, and are worthy of careful consideration.

In this part of the book there are many errors of detail. The description of Winchester on page 54 belongs to the twelfth century, not to the eleventh; the Cnihten Gild of London was dissolved in 1125, not 1115 (p. 49); the gild hall at Wycombe was called "knaveshorn," not "knaveshorn" (p. 59); "scot" should not be distinguished from "lot" in the phrase "scot and lot" (p. 61); "hanta-chevesle" (p. 76) is a wrong reading of "hantachensele"; the term "foreigner" was not limited to strangers from *other* counties (p. 87), but comprehended also persons within the same county; for "worthy for hire," page 88, read "serving for hire"; chapter 24 of the Berwick Statutes was not enacted in 1284 (p. 95); the *liber burgus* was never granted to the men of a gild (p. 99); Dr. Gross does not limit the meaning of hanse in the way stated on page 104; the charter of York concerning the hanse was granted by John, not Stephen (p. 153); for "commonalty of Bedfordshire" (p. 380), read "commonalty of Bedford."

The body of the work (pp. 111-365) contains the history of the gilds of Hull, especially its trade fraternities, and deserves much praise. Dr. Lambert here gives us the most complete publication of the records of craft gilds which has as yet been offered to the public in connection with any provincial town of England. The portion of the history of English gilds which still remains to be investigated is that relating to the craft fraternities. The difficulty in studying the latter is the paucity of printed records. This hiatus Dr. Lambert's book helps to fill up. It is to be hoped that his example will be imitated by other local historians, and that, with the help of such publications, a good history of the English craft gilds and of their relations to economic development may soon be written.

Dr. Lambert closes his treatise with a bibliography and an index, neither of which can be commended. The former is very brief, and purports to give "a list of those works and contributions . . . which are not included in the very full account contained in Dr. Gross's 'Gilda Mercatoria' and 'Gild Merchant.'" Notwithstanding this statement, about one-quarter of the titles in Dr. Lambert's bibliography are to be found in Dr. Gross's list of authorities.

The Dialogues of Plato, translated into English, with analyses and introductions. By B. Jowett, M.A. Third edition. 5 vols. Macmillan. 1892.

To this third edition of Prof. Jowett's monumental work the publishers prefix a note stating that "the additions and alterations which have been made, both in the introductions and in the text, affect at least a third of the work." This is not an over-estimate. The second edition contained 3,015 pages, the present one 3,410, or nearly one-seventh more matter. This consists of eight entirely new essays, enlargements of the old ones and of the introductions, preface, and index, new translations of the Eryxias and the Second Alcibiades, and a slight expansion of the earlier rendering throughout. These enlargements in matter are accompanied by changes not less extensive and important in the form of presentation. The whole appearance of the page is altered. The type is smaller, the margin broader, the top of each page now carries a running line descriptive of the topic beneath. The title of the dialogue has retreated to the outer corner of the page; immediately below it stand the names of the characters who are at the moment talking; and, further down, beside each paragraph, is printed a marginal summary of contents. For students, and for those who need to look up a matter rapidly, these condensed analyses are a great convenience. The insertion of them, together with the additions previously mentioned, make this edition almost a new work.

The changes in the translation are individually less striking. In 1871 Prof. Jowett was no tyro. At that time his scholarship was already solid and his method well established. In his long life with Plato he has experienced no large repentances. But being, like his master, an artist, he has never ceased to study neatness, simplicity, adaptation to the reader, subtle textual accord. The results of many mutually correcting moods are here given in a multitude of delicate emendations. How numerous these are may be estimated from the fact that it would be hard to find half-a-dozen consecutive lines in the entire work which have altogether escaped alteration. No one will admit that all these changes are for the better; yet, bearing in mind what Prof. Jowett himself has said, that "translation is dependent for its effect on very minute touches," most readers will agree that on the whole each page, while making a closer approach to the Greek, conveys more than ever to both ear and mind the impression of a piece of masterly English.

The conveyance of this impression is the distinctive mark of Prof. Jowett's work. Commonly the translator who seeks to reproduce beauty fails because he has not the resources of his own tongue at command. For purposes of translation, scholarship is more important as regards the language into which, than as regards that out of which, the rendering is made. Defects in the latter can largely be made up at the moment from books; for the former a man must rely on himself. Prof. Jowett has the double wealth. Primarily a literary man of exceptional power, he happens also to be the first Greek scholar in England. Both Greek and English he therefore understands and reverences, and he is at the same time curiously free from the prejudices of his class. He perceives that "the tendency of modern languages is to become more correct as well as more perspicuous than the ancient." He declares that "in some respects ordinary English writing, such as the newspaper article, is superior to Plato." Yet he has labored for a quarter of a century to domesticate Plato in the West, and at last, in these beautiful volumes, may be said to have made him as completely our countryman as ever he was that of Sophocles, Lucian, or Plotinus. Here Plato talks in all his grave and playful amplitude. Here we feel his grace, his humor, his dramatic power, his fondness for the mere act of utterance, his combination of passionate Hellenism and cosmopolitanism, his luminous insight into common things, his world-scorning morality, his suggestion everywhere of meanings deeper than he cares to express. All this Prof. Jowett has rendered. No other English translation from the Greek, except our English Bible, has brought over so fully the riches of its original.

The Grammar of Science. By Karl Pearson, M.A., Sir Thomas Gresham's Professor of Geometry. [The Contemporary Science Series.] Imported by Charles Scribner's Sons. 1892.

THE title of this book hardly prepares the reader for its real nature. It is an attempt to elucidate, in an original train of thought, what amounts, generically speaking, to Kantian nominalism, and to show its applicability to contemporary scientific problems. Although the metaphysical doctrine from which it proceeds is all but exploded, and rests upon an inaccurate psychology and an uncritical logic, in our opinion, yet it must be conceded that the book is one of considerable power, and contains matter for salutary reflection for anybody who cares to think deeply.

"The object of the present work," says the author, "is to insist that science is in reality a classification and analysis of the contents of the mind." This suggests that investigation consists in first collecting one's facts, and then locking one's laboratory door and retiring to one's study to work out one's theories; whereas, in truth, it involves experimentation alternately with things and with the diagrams of things. The realist will hold that this alternation is helpful, because the reason within us and the reason in nature are essentially at one; while the conceptualist will wish to separate his facts and theories as much as possible. He holds that any uniformity or law of nature is, as Prof. Pearson says, a mere "product of the perceptive faculty." Newton's great work was "not so much the discovery as the *creation* of the law of gravitation"; and the force of gravity, because it is a concept, not a percept, has no reality. "The mind of man," he tells us, "in the process of classifying phenomena and formulating natural law, introduces the element of reason into nature; and the logic man finds in the universe is but the reflection of his own reasoning faculty." This is (as we think) very false; but it is the definite position, broadly taken, of a vigorous thinker.

It is hardly necessary to say that the nodus of the whole argument lies in an attempt to show that "the reality of a thing depends upon the possibility of its occurring as a group of immediate sense-impressions." But the author hardly seems aware that this statement will be regarded by most psychologists as involving an analysis of consciousness now quite out of date. In the first place, it is not possible, as here implied, for the same sense-impression to occur twice. It is an individual event which happens once only. When a sensation had today is said to be identical with one had yesterday, what is true is, that two sensations are recognized to be alike; and this likeness resides not in those sensations, nor in any others, but in the irresistibleness of an act of generalization. Thus, generality is essentially involved in that whereon the reality of a thing is said to depend; and that consideration is fatal to nominalism. Besides, there is no such thing as an "immediate" sense-impression: the only things immediately given are total states of feeling, of which sense-impressions are mere elements; and to say that they are elements is a metaphorical expression, meaning, not that they are in the immediate feeling in its immediateness, but that the act of reflective judgment is irresistible which perceives them there. Here, as before, therefore, a product of analytic thought is detected as essential to that whereon the reality of a thing depends; and, as before, nominalism is refuted. Moreover, in both these cases, and in all others, that which is most essential to reality is the irresistibleness of something; and this sense of resistance is a direct presentation of externality —what Hamilton called an immediate perception. Let the subjectivism out of which nominalism springs be modified by the recognition not merely of immediate feeling, but also of this sense of reaction, and further of the generalizing movement, and it will become a harmless doctrine enough—a mere aspect of realism.

In his application of his nominalism to problems of science, Prof. Pearson has adhered to the spirit of the 'Kritik der reinen Vernunft' with surprising fidelity. He has said things which Kant did not say, but which are so completely in his line of thought that we almost seem to be reading the old master himself. Many of his observations are interesting; others seem quite untenable. Thus, he adheres to Laplace's doctrine of indirect probabilities in its least acceptable form, relying here upon Mr. F. Y. Edgeworth's cobwebs. In a still weaker fashion, he allows himself to be confused by such a writer as Dr. Ernst Mach, in regard to the relativity of motion. The conclusion to which his nominalism leads him is that motion is wholly relative. If this were proved, the truth of Euclid's postulate concerning parallels would be an easy corollary; but, unfortunately, as far as rotation is concerned, the proposition is in flat conflict with the accepted laws of mechanics, as Foucault's pendulum-experiment will remind us.

Ethnology in Folklore. By George Lawrence Gomme, F.S.A. D. Appleton & Co. 1892. 12mo, pp. vii., 203.

THE scientific bias communicated a few years ago to folklore studies by Mr. Lang and Mr. Frazer in the attempt to connect them with anthropology, has resulted in stimulating renewed attention to, and vastly increasing the interest of, superstitions and customs which formerly possessed little attraction for any but the antiquary. Since the scholars just mentioned have shown the great light which modern folklore throws upon the question of classic mythology, many investigators have used this means for the elucidation of hitherto unsolved problems of ethnology as well. A vast mass of folklore has been gathered from every country in Europe and the East, and the time has come to sift this mass, and, if possible, to see whether the comparative method of investigation can show that folklore is a science and a valuable auxiliary to the other sciences. As we have said, many scholars have drawn upon various classes of folklore as illustrative of problems in mythology, as Sir George Cox, who made free use of modern popular tales in

his 'Aryan Mythology,' and Mr. Frazer, who employed extensively modern superstitions and customs in his 'Golden Bough'; but no attempt has been made until lately to formulate the principles and laws of folklore in general. This labor the learned President of the English Folklore Society has just undertaken, and has accomplished his task, as might have been expected, in a scholarly and entertaining volume, which, by its inclusion in the "Modern Science Series," edited by Sir John Lubbock, shows what a different plane the study of folklore has come to occupy since the day when the Grimms began their collection of popular tales and customs.

Mr. Gomme's volume is entirely unpretentious, and free from the exaggerated claims which the votaries of a new science are apt to make. If the results of his studies seem somewhat meagre and vague, it should be remembered that the author confines his investigations to but one field, ethnology, and that, in the very nature of things, the results are liable to be indefinite. In dealing with the problem of vanished races, or of the mutual influences of races, where the evidence is wholly drawn from popular customs and beliefs, which, while they are extraordinarily persistent, are also easily changed and modified, we must not expect the same degree of certainty as in other fields of research, where the evidences are of another kind. It is impossible within the limits of this notice to give an adequate idea of Mr. Gomme's method and its results. Suffice it to say that he attempts to show that custom or belief which survives in the savage form is of different ethnic origin from custom or belief which survives in higher forms. In other words, the folklore of any race will be arrested when a race of superior civilization comes in contact with it, and, to use Mr. Gomme's own words, "if the incoming civilizations flowing over lower levels of culture in any given area have been many, there will be as many stages of arrestment in the folklore of that area; and in so far as each incoming civilization represents an ethnic distinction, the different stages of survival in folklore would also represent an ethnic distinction."

The principal result of Mr. Gomme's studies is the ability to point out, somewhat vaguely, it is true, the distinction between the non-Aryan and the Aryan elements in folklore. Incidentally, the author treats of a great variety of interesting topics involving the early civilization of England and Ireland, and many remarkable examples are given of the survival of savagery down to comparatively recent times. The book is scholarly and suggestive, and the method indicated can hardly fail in the future to produce novel and valuable results.

A Tramp Across the Continent. By C. F. Lummis. Chas. Scribner's Sons. Pp. 270.

Now that there are half-a-dozen ways of crossing the continent by steam, "going across the Plains" has become a mere tradition and material for romances of the future. The suppression of the Indians and the conversion of a large part of the "Great American Desert" into smiling gardens, by means of irrigation, would make a trip to California in "prairie schooners" much less perilous than it used to be; but as it would cost many times as much as the railroad fare, no one ever undertakes it at present. Under these circumstances Mr. Lummis's tramp across the continent appears in the light of a novel experiment. His motives for undertaking it were curiosity and a craving for unlimited "joy on legs," both of which were abundantly satisfied.

Leaving Cincinnati on September 12, 1884, he arrived in Los Angeles 143 days later, having walked 3,507 miles, or an average of almost 25 miles a day, although on some days the mileage was nearer 50 than 25. As the result of his trip he gives this advice to pedestrians:

"People who do not walk all the time should wear thick-soled, heavy shoes for a tramp; but if one is to make a business of walking, the best way is to be as lightly shod as possible, and let the soles and ankles toughen and strengthen without 'crutches.' Since learning to campaign in the Apache moccasin, I have always preferred a few days of sore feet and subsequent light-footedness to perpetual dragging of heavy shoes."

Mr. Lummis saw many interesting sights, but his experiences on the way were not such as to encourage others to imitate his example. He was repeatedly "held up" by tramps, and only his nerve and skill in the use of the revolver saved him. Once he came within an inch of being murdered by a convict who wanted his revolver; he had several encounters with wild cats and California lions, broke his arm in climbing a hill, barely escaped from snow-storms in the mountains and the parching sun of the desert; and, to cap the climax, his dog went mad in Arizona and had to be shot in self-defence, and a very narrow escape it was. These adventures, with many others, make this book capital reading for boys, old and young, and it will interest others who are not satisfied with seeing the West from a car-window. There is, of course, a good deal about fishing and hunting in the book; but, with a curious inconsistency, Mr. Lummis, in speaking of the exterminated buffalo, inveighs against "the pot-hunter, the hide-hunter, and, worst of all, the soulless fellow who killed for the mere savagery of killing." Yet only a few pages later he describes triumphantly how he killed two antelopes within a minute, and barely missed a third, although all he got from this murder of animals over whose beauty and grace he goes into raptures, was "a few pounds of steak."

The Horse: A Study in Natural History. By William Henry Flower, C.B., etc., etc. [Modern Science Series.] D. Appleton & Co. 1892. 8vo, pp. xiv, 204, illustrated.

Under the guidance of Prof. Flower, it is possible to become familiar with the natural history of the noblest of our domesticated animals easily and enjoyably. These pages treat of the place in nature, the relations in the past, the nearest existing relations, and the evolution of the present structure of the horse. The presentation is of the broadest and most philosophical, and is the outcome of the most recent investigations. The text is adapted to readers in general; it is concise, clear, and interesting, alike in dealing with the uncouth nearest of kin, the tapirs and rhinoceroses, in tracing the evolution from possible ancestors by means of teeth or limbs, or in various details of anatomy. The book is admirable in the matter relating to established facts; it is commendable also in that pertaining to things that may or may not be. Doubtful matters are shown in their true light; they are left doubtful without attempt at theoretical proof. Degrees of probability are indicated in cases, but the reader is allowed to build his own hypotheses. This will win the hearty approval of those who have felt the detrimental effects of prejudices induced by so-called "good working theories." Apparent ancestors among the fossils may be displaced in the future by more acceptable discoveries without seriously impairing our author's work.

He has left a few points open to the critic. Through an unfortunate reference to the work of Mme. Pavloff, five-toed Phenacodus is apparently identified with the more advanced Hyracotherium and a reduced number of digits. The general precision of statement is marred by a sentence on page 160: "The scapula is of complex shape, with strong, projecting processes. In the horse (see Frontispiece) the humerus especially, so prominent a feature in the scapula of man, being scarcely visible. There is no trace of a clavicle." The meaning of the second of these sentences is not evident. Comparisons are aptly made between the "ergot," the bare pad in the fetlock of the horse, and a similar pad under the feet of other mammalia. We must, however, dissent from the statement that this pad in the horse is now apparently useless, remaining only as testimony to the unity of structure with other mammals and of probable descent from a more generalized form, for the well-being of whose life this structure was necessary. The ergot is one of several protective structures behind the joint at the lower end of the metapodial, and is in function on rough or yielding grounds, in sands, gravels, or loose rocks, or in descending inclines. Naturally, on wild species of Equus it is more developed. But opportunities for fault-finding are very rare in the case of this book, which is one of the best of good books on natural history.

The Life of Col. Paul Revere. By Elbridge Henry Goss. With portraits, many illustrations, facsimiles, etc. Two vols. Boston: Joseph George Cupples. 1892. 8vo, pp. 689.

Paul Revere was one of the most fortunate of the minor characters of the Revolution. He never held any important position, but by a lucky chance he filled a romantic part, and, thanks to a modern poet, "Paul Revere's Ride" is likely to be remembered by posterity. He was the trusted friend and agent of the Boston patriots, he served loyally and ably, he survived the perils of war to reëstablish himself in business, and he left descendants among the most distinguished families of his native town. Whether among his other pieces of good fortune the publication of these volumes is to be reckoned, may be a matter of doubt.

Mr. Goss is evidently a painstaking antiquary, greatly interested in his subject, and he has collected everything, perhaps, which a biographer could need. On the other hand, these books, as books, are discreditable to the publisher. The paper is shiny, the back-margins are too small, and the volumes can neither be opened nor held with any comfort. The illustrations are mostly printed from "process" plates of the poorest description, and, for some inconceivable reason, they are printed in various colors, often to the further injury of the engraving. Of the drawings we prefer not to speak, as they seem to be works of love. There is a flavor of sham antiquity about the book, beginning with a title-page whereon the publisher divides his names between two lines, which is unnecessary and unpardonable. We presume that the author is not responsible for these defects, as he has shown his zeal and knowledge in the collection of Revere's engravings; but though these originals, in their pristine defects, are merely historical evidences and not models for an art academy, they are a thousand times more repulsive in red, green, blue, and yellow reprints.

Paul Revere was born at Boston December 21, 1734, and was the son of Apollos Rivoire, a native of Riancaud, France, who came hither as a youth and learned his trade of goldsmith with John Cony of Boston. The father anglicized both his names to Paul Revere, and died in 1754. By his wife, Deborah Hichborn, he had twelve children, of whom our Paul was the third. The son followed his father's trade, and, like many others, passed from the engraving of gold and silver to that of copper plates for printers' use. His skill in the latter art, though very limited, was of great use to his country, when employed both on patriotic caricatures and on the notes and bonds of the Revolutionary period. His mechanical ability was also of service in the manufacture of gunpowder and cannon, and, after the war, he was the founder of the copper-manufacturing industry in Boston and its vicinity.

It would be useless to repeat the story of his notable "Ride," which was only one of the many good things he did. Everything is recounted in Mr. Goss's book, and we are all obliged to him for his industry. An abstract of the volumes would probably be more serviceable, however, to the memory of this sturdy patriot, industrious citizen, and admirable man.

The Claims of Decorative Art. By Walter Crane. Boston: Houghton, Mifflin & Co. 1892.

One is likely to open this book with anticipations of pleasure and profit. So much of the writing on matters of art is done by men who have no practical and little theoretic acquaintance with their subject, and whose literary skill is their only critical equipment, that a book on art by an artist of ability seems very welcome. One expects, at last, to be told something. In this case, however, these very legitimate expectations are aroused only to be disappointed.

Mr. Crane is a decorative artist of great talent, but he is also a Socialist, and his Socialism occupies a much larger place in his writings than does his art. He seems, also, to be a man incapable of reasoning and guided entirely by sentiment. Almost any one of the sixteen essays in the present volume might be given the title of any other and no harm done. Wherever he starts, he always comes out at the same place. Over and over again, with "damnable iteration," he laments that modern art is all wrong, and modern life is all wrong; that art is given over to a vain competition with photography, and life to "commercialism" and the struggle for money; and ever comes the refrain, "as if it were the burthen of a song," "Meanwhile, the only hope, alike for art as for humanity, lies in Socialism."

A part of his indictment is true, and occasionally he comes near saying something valuable about "Design in Relation to Use and Material," or about "Imitation and Expression in Art"; but the fatal inability to reason spoils all, and makes what might have been a real contribution to criticism a mere expression of personal feeling. The world is out of joint, and somehow Socialism is to set it right. The vague millennium of the Socialist which is to remake mankind and turn us all into angels, will, of course, save art as well as humanity; but the how or the why Mr. Crane is incapable of telling us.

We cannot recommend Mr. Crane's book to the student of art as one from which he is likely to glean any instruction.

The American Government, National and State. By B. A. Hinsdale, Ph.D. Ann Arbor, Mich.: The Register Publishing Company.

Prof. Hinsdale's volume consists of a Constitutional text-book, preceded by a history of the origin of the American State. The chief difference between it and most books of its class lies in the greater attention paid to the historical introduction, and the space devoted to the machinery of the State Governments. There is no great originality in the descriptive part—indeed, it would be difficult, after all that has been written on the subject, to find much scope for originality here; the main thing is that the description is accurate, that on disputed points the author's views are expressed with reserve, and the aim generally kept in mind is merely to give the "better opinion."

We think the author has here and there gone into greater detail than is necessary, and in one or two places, at least, the subject under consideration is not fully elucidated. Thus, in the discussion of the legal-tender act no notice is taken of any decision of the Supreme Court later than that in the twelfth volume of Wallace's Reports; and the final judgment by which the power to make paper money legal tender in the discretion of the Government was affirmed is not even alluded to. This is a defect which should be corrected in another edition. No more important decision as to the powers of Congress has been rendered in our time, as may be easily seen when we reflect that it is perfectly true, as Mr. Hinsdale says, that the framers of the Constitution "undoubtedly supposed they were making irredeemable paper money, issued by the Government, impossible." In general the book is brought down "to date."

The treatment of the Commerce clause (pp. 184–187) is good enough as far as it goes; but without some account of the police power, and the question of concurrent powers, it is incomplete. These are given elsewhere, but, scattered through the book, one sheds little light on the others. On the other hand, it is to be said that the maker of such a compendium as this is perpetually confronted with the difficulty that he can never fully explain American constitutional law except to a person who has received a legal education, and in writing for ordinary students is continually in danger of falling between the two stools of too much explanation or too little.

The book opens with a dissertation on the Science of Politics. Many treatises on this subject end in suggesting a doubt as to whether the writer has any clear idea of what a "science" is, and to persons of a sceptical turn it will be refreshing to find that Prof. Hinsdale is able to compress the whole science into eighteen pages. Even as to the truth of the propositions contained in this narrow compass we doubt if his fellow-scientists will wholly agree. It may be doubted, for instance, whether it is scientifically correct in a treatise of this kind to say that the Poles are a "nation." There is a Polish race, or a Polish people, but the term nation in the mouths of modern publicists generally imports the idea of territorial sovereignty, and not that of race affinity. The question is not one of etymology, but of usage.

Brahmanism and Hinduism: or, Religious Life and Thought in India, as based on the Veda and Other Sacred Books of the Hindus. By Sir Monier Monier-Williams. Fourth edition. Macmillan & Co. 1891.

The very admirable work of M. Auguste Barth, entitled 'The Religions of India' (2d ed., London, Trübner, 1890), treats in order of the Vedic religions, of Brahmanism, ritualistic and philosophic, of Buddhism, of Jainism, and finally of Hinduism. The Oxford Sanskrit professor's beautiful volume, which lies before us, has for its proper subject the last of these topics, Hinduism. Barring ritualistic Brahmanism, it is the dreariest of them all. The monstrous mythology of the worshippers of Vishnu and Çiva, the endless ramifications of the sects, the demon-worship, hero-worship, ancestor-worship, the tree and serpent-worship, the religious life of the orthodox Hindu, his fasts and feasts, temples, shrines, and places of pilgrimage—all is here patiently and faithfully set forth by a writer who has not only read his Sanskrit books, but has also made three journeys to India for the personal study of subjects in which autopsy is of especial value.

Unattractive as these subjects may seem, they nevertheless compel the attention of the serious student of anthropology and religions, and the author has invested them with as much liveliness as was feasible. It is matter for curious reflection that we nineteenth-century Americans have contemporaries on the other side of the globe—in Orissa—who worship the Queen of England as their chief divinity, and that men of remarkable strength or of unusual deformity are liable—"like Paul and Barnabas at Lystra"—to be converted into gods (p. 259).

Looking at the practical aspects of the case, it seems idle to hope that the mass of the grosser forms of idolatry and superstition will yield to direct efforts at proselyting. The force of the whole system of modern civilization and enlightenment will ultimately dislodge it, and so, by indirection, change the general habit of mind of the Hindus. A hundred miles of new railway in India is more efficient in breaking down the prejudices of caste than are as many thousands of tracts and arguments.

Apropos of the recent discussions of branding as practised among young collegians, it may interest them to know by way of precedent that they can cite the Vada-galai and Ten-galai parties of the Ramanuja sect of the Vishnuites. These parties quarrel most bitterly about the form of their frontal emblems. The Vada-galais hold that the mark on their foreheads should represent the right foot of Vishnu (from which the Ganges sprang), while the Ten-galais insist that both feet should be thus honored. But they all agree in branding the boys of seven and upwards on the arms and breast with the discus and conch-shell of Vishnu, to stamp them as true followers of the god. Since they go about mostly bare, this is a sane and significant proceeding.

Egypt: Handbook for travellers, edited by K. Baedeker. Part Second: Upper Egypt, with Nubia as far as the Second Cataract and the Western Oases. With eleven maps and twenty-six plans. Imported by Charles Scribner's Sons.

This volume has been long in preparation, and has been produced only after much trial on the part of the publisher and much pains on the part of the compilers and writers. The travelling public have earnestly desired its appearance, while to only a few was it given to know the cause of the long delay. But at last it is here, and will meet with a most hearty welcome from those who desire to have a handbook of convenient size which shall contain all—yes, and more than all—one needs to know

in order to view and be amazed by the wonders of the land in question. The names of those who have assisted in the preparation of the volume are a sufficient guarantee of the scholarship of the undertaking: Georg Ebers of Leipzig, Johannes Dümichen of Strassburg, and August Eisenlohr of Heidelberg. These are names well known in Egyptological circles, and greeted with approval in those branches of study to which they have especially devoted themselves.

The volume is supplementary to the earlier one on Lower Egypt and the Delta, and relies upon the introductions and notes previously published. The only things reprinted are the dynastic lists and the hieroglyphic names of the more important kings. As indicated in the title, the places and regions described are in Upper Egypt, including the Fayum, Nubia, and the oases. The translation is excellent, the type clear and distinct, though small, and the general appearance of the volume in accord with the other volumes of the entire series. Henceforth the traveller in Upper Egypt will have the satisfaction which comes from the possession of a competent guide-book, even though in the guise of a "red Baedeker."

BOOKS OF THE WEEK.

Aitken, G. A. The Poems of Andrew Marvell. 2 vols. London: Lawrence & Bullen; New York: Scribners. $3.50.
Allen, Grant. The Duchess of Powysland. M. J. Ivers & Co. 25 cents.
Atkinson, Edward. The Science of Nutrition. Springfield, Mass.: Clark W. Bryan & Co. 50 cents.
Balestier, W. The Average Woman. U. S. Book Co. $1.25.
Baring-Gould, S. In the Roar of the Sea. National Book Co.
Betham-Edwards, M. France of To-day. Lovell, Coryell & Co.
Black, W. Magic Ink, and Other Stories. Harpers. $1.25.
Blok, P. J. Geschiedenis van het Nederlandsche Volk. Eerste Deel. Groningen: J. B. Wolters.
Bouchot, Henri. Les Clouet, et Corneille de Lyon. [Les Artistes Célèbres.] Paris: Librairie de l'Art; New York: Macmillan.
Carleton, Will. City Festivals. Harpers.
Chambers's Encyclopædia. New ed. Vol. IX. Round—Swansea. Philadelphia: J. B. Lippincott Co. $3.
Davis, W. T. Days Afield on Staten Island. New Brighton, N. Y.: The Author.
Deene, Harley. Cortland Lasker, Capitalist. Chicago: Laird & Lee.
Dickson, W. B. Modern Punctuation. Putnams. 75 cents.
Dobson, Austin. Fielding's Journal of a Voyage to Lisbon. London: Chiswick Press; New York: Macmillan. $4.
Dumas, A. The Black Tulip. Rand, McNally & Co. 25 cents.
Earnest Thoughts for Every Day. T. Whittaker. 25 cents.
Ewart, William. Cardiac Outlines. Putnams. $1.50.
Ferguson, George. Our Earth—Night to Twilight. Vol. I. London: T. Fisher Unwin.
Frost, A. B. The Bull Calf, and Other Tales. Scribners. $1.
Gouin, Prof. F. The Art of Teaching and Studying Languages. London: George Philip & Son; New York: Scribners. $2.25.
Hall, Gertrude. Far from To-day. Boston: Roberts Bros. $1.
Hewins, W. A. S. English Trade and Finance, Chiefly in the Seventeenth Century. London: Methuen & Co.
Hutton, Laurence. Literary Landmarks of London. 8th ed., revised and enlarged. Harpers.
Jacobs, Joseph. The Familiar Letters of James Howell. 2 vols. London: David Nutt.
Jowett, Prof. B. The Dialogues of Plato. 3d ed., revised and corrected throughout. 5 vols. Macmillan. $20.
Keary, C. F. Norway and the Norwegians. Scribners. $1.50.
Mr. Facey Romford's Hounds. London: Bradbury, Agnew & Co.; Philadelphia: J. B. Lippincott Co. $2.25.
Ober, C. F., and Westover, C. M. Manhattan, Historic and Artistic. Lovell, Coryell & Co. 50 cents.
Olmis, Elizabeth. Morris Julian's Wife. Robert Bonner's Sons. $1.
Roberts, Morley. The Mate of the Vancouver. Cassell. 50 cents.
Sherwood, Mrs. M. E. W. A Transplanted Rose: A Story of New York Society. Harpers. 50 cents.
Snow, Alvin L. Songs of the White Mountains, and Other Poems. Creston, Iowa: *Gazette* Publishing House.
Sohm, Prof. Rudolph. The Institutes of Roman Law. Oxford: Clarendon Press; New York: Macmillan. $4.50.
Spender, Mrs. J. K. Zina's Awaking. Robert Bonner's Sons. $1.
Stevenson, R. L., and Osbourne, L. The Wrecker. Scribners. $1.25.
Talleyrand, Prince de. Memoirs. Vol. 5. Putnams. $2.50.
Tesla, Nikola. Experiments with Alternate Currents. W. J. Johnston Co.
Verses to Order. London: Methuen & Co.
Weismann, Prof. A. Essays upon Heredity and Kindred Biological Problems. Vol. II. Oxford: Clarendon Press; New York: Macmillan. $1.30.
Wendt, Prof. H. H. The Teaching of Jesus. Vol. I. Scribners. $2.
Whiting, Charles E. The Complete Music Reader. Boston: D. C. Heath & Co. 85 cents.
Winter, J. S. Experiences of a Lady Help. Rovendon Co. $1.
World's Columbian Exposition Sketch-Book. Rand, McNally & Co.
Zola, Emile. La Débâcle. Paris: Bibliothèque Charpentier; New York: B. Westermann & Co.
Zola, Emile. The Downfall. Cassell. 50 cents.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing to us. Special collections formed, and fuller information supplied than from any other house. Books both old and new, and relating to any subject, can readily be supplied at very moderate prices.

Agents for Clubs, Libraries, and all private Collectors.

187 PICCADILLY, LONDON W.

Our new **Book Catalogue** not only gives the size and price of all the standard works on Homœopathy, but an interesting description of each, together with opinions of the press and of physicians. Mailed free.

BOERICKE & TAFEL,
Homœopathic Pharmacists and Publishers,
1011 Arch Street, Philadelphia.
Established in 1835.

BACK NUMBERS, VOLUMES, OF sets of leading and scarce magazines, etc., for sale by H. WILLIAMS, 195 West 10th St., N. Y.

"The weary brain requires some nerve sustaining element as food."—HERBERT SPENCER.

Crosby's Vitalized Phosphites.

The vital principle of animal and vegetable life isolated from the ox brain and wheat germ.

The loss of memory, the tired and exhausted feeling, the dull, unrefreshed sleep, or nervous sleeplessness, brain weariness, depressed vitality, are simply the brain and nervous system calling for their necessary food. In this condition the Vitalized Phosphites give great relief. It restores the true protagon, the brain phosphoid, increases brain and nerve power by specially feeding the nerve centres. It reinvigorates brain and body.

For thirty years endorsed by leading physicians and the world's best brain workers. Formula on the label. Pamphlet free to those who write for it. Druggists or by mail, $1.00. 56 W. 25th St., N. Y. *F. Crosby Co.*

Horsford's

ACID PHOSPHATE,

Recommended and prescribed by physicians of all schools

FOR

DYSPEPSIA, NERVOUSNESS EXHAUSTION,

and all diseases arising from imperfect digestion and derangements of the nervous system.

It aids digestion, and is a brain and nerve food.

Beware of Substitutes and Imitations.

CATALOGUE NO. 34. WITH USUAL variety of interesting items, ready. A. S. CLARK, Bookseller, 34 Park Row, N. Y.

The Nation.

NEW YORK, THURSDAY, JULY 14, 1892.

The Week.

Gov. PATTISON of Pennsylvania has done well to call out the entire division of the national guard of that State to restore order at Homestead. There has been some disposition to criticise him for not having taken such a step sooner, but fair-minded people will generally feel disposed to the conclusion that deliberate action was quite as wise a policy. The strikers have now had every opportunity they could ask to put their side of the case before the public and to make their disposition clear. The stand which they have taken is fully understood, and their contention is universally recognized as untenable and intolerable. Everybody who believes in the reign of law sees that there is only one thing to be done, and that is to end the anarchy of the present situation at Homestead, to restore the works to the owners of the property, and to protect them in their right to operate them. If Gov. Pattison had rushed some troops to the scene of the trouble the moment he heard of the collision on July 6, there would have been more or less questioning as to the rights and wrongs of the question at issue and as to the necessity or wisdom of his action. Now the public sentiment of the entire nation will unquestioningly sustain his course, and the strikers will have no moral support in making any opposition to the troops.

The principal reason for fearing that the Stewart Silver Bill might pass the House was, that it might go through in the sudden access of hope and frenzy caused by its unexpected success in the Senate. Then, too, there was for a time a feeling on the part of Republican members of the House that they must do nothing to make the financial record of the Republican Senate worse than that of the Democratic House, and that, therefore, they had no special interest in voting against the bill. But the two days' filibustering of the anti-free-coinage Democrats gave opportunity for a little cool reflection on the folly of the course of the men who were willing to wreck their party for the sake of an individual advantage, and there is every sign now that reason is resuming her sway and that the bill has no chance of passing. Even if the bill be brought to a final vote, which now seems improbable, the honest-money Democrats count upon a majority of twenty-five against it. On the whole, the Democrats appear to be successfully fighting off this attack of midsummer madness.

The perplexity of the free-silver men in the House over the repeal of the Sherman Act of 1890 is due partly to political and partly to economical considerations. They see that as it is, in the opinion of good lawyers, at least doubtful if the Stewart Bill does not deprive the notes issued under the act of 1890 of their legal-tender quality, they have made it easy for President Harrison, who is astute both as a lawyer and as a politician, to veto the bill as being an act of repudiation, without committing himself in the least on the free-coinage question. The attempt of Mr. Harrison's Republican enemies to "put him in a hole," would therefore be foiled, while the sincere silver-men would be no nearer their end than before. As to the economic argument, the anxiety of the advocates of free coinage that the Government should not deprive the notes issued under the act of 1890 of their legal-tender character is not due to any tenderness for the national credit, but to a fear that this would result in a contraction of the currency, the very thing which they are making all the trouble about, and which they are constantly denouncing as a crime. Really it makes little difference whether these notes retain their legal-tender character or not. If they are absolutely annulled, the currency is contracted suddenly to the extent of $60,000,000, or whatever the amount of these notes may now be. If, which is the most reasonable supposition, the repeal of the act of 1890 makes the notes no longer legal tender, but leaves them the obligations of the Government, redeemable in coin on demand, they are good enough money for anybody, and will circulate as freely as national-bank notes. But, and this is the real difficulty of the silver-men, if these notes are redeemed they cannot be reissued; so that reduction of the volume of our currency is made easy, if not inevitable. There would be no shadow of authority for reissuing one of these notes that had found its way back into the Treasury.

The chief result up to date of President Harrison's "personally conducted" campaign has been a cheapening of the Chairmanship of the National Committee such as has never been seen before. The way it has been hawked about is ingeniously calculated to make any self-respecting man refuse to touch it, and it is no wonder that Senators Aldrich and McMillan are reported to have done so. One consequence of these successive declinations appears to have been to cause the President to show considerable deference to that mammon of unrighteousness which he was so virtuously turning his back upon. A faithful Republican organ described ephemeral Chairman Campbell as coming on Wednesday week from a conference with Mr. Harrison, met at the White House door by W. W. Dudley (who, having got as far as the door, may soon hope to be invited to dinner), joined by Dick Quay, and driven to the house of the latter's father. Thence he betook himself to the President's inner sanctum again, to report the advice of the greatest politicians of the age, and shortly emerged with the announcement that he was going to consult with "certain persons in New York." We think the Hon. Thomas C. Platt will discern here a veiled allusion to himself. What the general effect of all this manœuvring will be upon the better class of Republicans may be inferred from the following remarks of the New Bedford *Mercury:*

> "The spectacle of the President of the United States running a political campaign for his own reëlection is not an altogether pleasing sight. He is, of course, following the example of Governors and Senators and Representatives, not to speak of hundreds of the small-fry officials, of both parties. And Democratic criticism of him in this regard is both insincere and inconsistent. Still, we think many of Mr. Harrison's best friends would be better pleased if he would let the Machine alone."

Those persons who sincerely think that President Harrison has given the country "a safe, clean administration" owe it to themselves to read the report of the Pension Office Investigating Committee. This report does not go back to the days of Corporal Tanner, and is therefore incomplete, but it is sufficient to make every one who reads it blush for his country. The comments of Judge Wheeler, the author of the report, are not very dignified, we regret to say, but the facts speak for themselves. A clerk who was dismissed by Commissioner Raum, but reinstated by Secretary Noble, testified that when he wished to see the son of the Commissioner, he found him during office hours on three successive days at the pool-rooms of a notorious gambling-place, accompanied regularly by a special examiner in the Pension Office, and sometimes by two other examiners. This young Raum was proved to have accepted a bribe for getting a man a place in the Pension Office, the applicant being personated by another person in the examination before the civil-service examiners. Young Raum was also proved to have pocketed money sent to the "conscience fund." Under the advice of counsel he declined to reply to these charges. Three old soldiers, however, who had made charges against this Raum, he having tried to levy blackmail upon one of them, were forced out of the Department upon manufactured evidence. Commissioner Raum himself charged one of these men with delaying a pension so that "an old soldier now lies in a pauper's grave" by reason of this wilful delay. The report of the investigating committee on this matter is almost too shocking for belief. They find that the old soldier was dead before the case was put in the hands of the maligned examiner, and that the

Commissioner knew it, so that he maliciously bore false witness against his subordinate.

We cannot here go into full details of the Committee's findings against Raum. He has, they allege, employed deserters from the army as clerks; he has at least tolerated scandalous immoralities between certain chiefs of division and their female subordinates; he has dismissed employees for reading newspapers that criticised the administration of his office; he has plotted to injure the reputation of a Congressman who was active in the investigation; he has supported his employees in their refusal to give information to the investigating committee; he has refused to explain how it was that a pension attorney endorsed his note for a large amount, which note he did not pay, although he advanced many thousands of cases in which this attorney was interested; he has, in fine, as the Committee charge, "prostituted his office for the purposes of private gain, prostituted his office for political purposes." Secretary Noble's conduct has been such as to make it probable that Commissioner Raum has been kept in office by the command of President Harrison. This policy of maintaining bad men in office was Gen. Grant's political ruin, but he did nothing worse than what President Harrison is now doing. Gen. Grant, moreover, was a simple-hearted soldier. President Harrison is an astute politician and also an elder in the Presbyterian Church.

The *Tribune* gives prominence to a declaration made by the editor of a Kansas newspaper, hitherto Democratic, that he will not vote for Cleveland, but will vote for Harrison. His argument is entirely logical, but we think that a little reflection would have led the *Tribune* to avoid publishing it. The editor's reasons for changing sides are, first, that Mr. Cleveland is bigger than his party, from which we may infer that he regards Mr. Harrison as exhibiting different proportions. In the second place, Mr. Cleveland is admired by men like Mr. George William Curtis, the inference from which is that Mr. Harrison is not admired by such men. In the third place, Mr. Cleveland is a free-trader, while the Kansas editor is a protectionist, as to which we have only to say that though Mr. Cleveland cannot, if he would, give the country free trade, Mr. Harrison is the true candidate of those who want more tariff taxation. In the fourth place, Mr. Cleveland is a gold-bug, while this editor believes in free coinage, indicating that he hopes for better treatment for silver at the hands of Mr. Harrison than at those of Mr. Cleveland. In the fifth place, Mr. Cleveland believes in reforming the civil service, the editor holding to the doctrine that the spoils belong to the victors, and therefore preferring Mr. Harrison. In the sixth place, Mr. Cleveland vetoed the Pension Bill which Mr. Harrison signed, and which will cost the country thousands of millions of dollars before we are through with it. Finally, the Irish dynamite element detests Mr. Cleveland, and so do the adherents of Tammany Hall, both these elements preferring Harrison.

It is doubtful if a stronger array of arguments in favor of Mr. Cleveland's election has been presented by any of his supporters than this which the *Tribune* lays before its readers as matter for encouragement to Republicans. They are invited to exult in their candidate because he is a submissive party man, because the most cultivated element in the community does not admire him, because he may sign some silver bill satisfactory to the free-coinage faction, because he is no civil-service reformer, and because he will attract the votes of the O'Donovan Rossas and of the adherents of David B. Hill. This is one of the most extraordinary combinations of attractions that have ever been offered to the *Tribune's* constituency, and, were it not for the saving feature of Mr. Harrison's undoubted protectionism, we should incline to the opinion that many worthy people, upon perusal of the Kansas editor's encomium, would decide to cast their votes for Mr. Cleveland.

The unique religious convention which held its sessions in this city last week was very much in evidence by force of numbers, if nothing else. There was something comic in the persistent incredulity with which hotel proprietors and railroad managers received the requests made of them to provide accommodations for an army of thirty thousand delegates. They had apparently measured the affair by the standard of the dwindling "May anniversaries" and other religious gatherings of the sort, and almost too late woke up to the fact that the enthusiastic and irrepressible young men and women of the Christian Endeavor Society meant what they said when they declared their intention of descending upon this city in midsummer 30,000 strong. The result has been that railroad trains have been crowded and stalled and hotels and boarding-houses taxed in a wholly unprecedented way. Moreover, the youthful vigor and high spirits of the delegates, and the hearty and unquestioning faith which they displayed in the power of their organization to conquer all obstacles, united to make them an altogether new species of attendants on a religious convention. A hardened politician is reported to have said, as he saw delegation after delegation of blooming maidens file down the street: "I tell you that if the Christian Endeavor Society continues to send such delightful specimens of young American womanhood into New York, they will own this town."

Everybody must sympathize with the young ardor and uncalculating devotion thus banded together for worthy purposes, and also be glad of all the good the Society has undoubtedly accomplished. Yet we presume that it will scarcely bring on the millennium prematurely, or will, in the long run, take a place in the religious history of our times as anything more than one of the long list of organizations supplementary to church work and life. We think, too, that those thoughtful people within the churches who have gravely questioned some of the Society's methods, have not been without reason for their doubts. The Society has probably owed a large part of its success to the social attractions it offers to young people in the churches, who have found in it a new outlet for the youthful spirits which the popular religion of two generations ago aimed to suppress, but to which church life nowadays seems bound to give play to the full. The rise of such a society to such power as it now has, witnesses to profound modifications in the prevalent religious conceptions. Conservative church people may be pardoned for doubting whether the new impulsive type of Christian character promises as stable and reasoned a religious faith and practice as were the fruit of older methods. Moreover, it is the testimony of some who have watched the workings of the Society from the inside, that the rule requiring every member to speak or pray at its meetings results too often in a forced and formal religiosity unpleasant to contemplate, in the young above all. Such things as their "sunrise prayer-meetings" at six o'clock in the morning seem either to speak of a desire to have a frolic in connection with such a service, or to lean to the notion which attaches special merit to vigils and ascetic practices. However, we do not suppose that such defects in the organization prevented anybody from perceiving its good qualities, or from taking a kindly interest in what was, in some ways, the most remarkable religious gathering ever held in this city.

The expiration this year of copyright on four famous novels comes to illustrate afresh the ethics of international practice in respect of literary property. 'The Scarlet Letter' went out of copyright early in the present year, and two or three cheap editions promptly appeared on the American market. In England, however, the event passed without notice, as the book had long since yielded the English pirate all the booty that could be wrung from it. On the other hand, American publishers are not affected by the knowledge that copyright on 'David Copperfield,' 'Pendennis,' and 'Alton Locke' ends with this year. Each of those volumes has been so freely appropriated in this country that the cessation of the author's rights in it will not influence its future price with us.

But in England, where might has not been right in this matter, a keen competition is looked for among publishers, several of whom are understood to be prepared to flood the market, at the earliest moment allowed by law, with cheap editions of the popular books mentioned.

It is impossible to appreciate to its full extent the calamity at St. Johns without noticing the fact that for all trading and distributing purposes that city was the colony of Newfoundland. In population alone the city comprised one-fifth of the colony's total inhabitants, and the appeals for relief estimate that the fire which swept the city on Saturday rendered homeless nearly half of its inhabitants. Such a stroke as this would be ruinous to a prosperous and growing community, but, as it happens, the colony of Newfoundland has for years been struggling with adversity. The codfish trade, the mainstay of Newfoundland's industry, has been falling off, and fishermen must nowadays sail a long distance out on the Banks, or up to the coast of Labrador, in order to get the fish that have deserted the near-by waters. The colony's debt has been rapidly increasing, and the railroad, in whose construction the debt was incurred, has thus far failed altogether to bring about the promised development of the interior. In 1886 Mr. Harvey, the geological expert of the colony, prepared at the Ministry's request an ingenious pamphlet setting forth the colony's great resources in coal, timber, and farming lands. The hopes aroused by its publication have been completely disappointed. The coal and forests and arable soil are all there, and in some future stage of the continent's history may be of immense value, but there is clearly no profit in working them now. Crown lands within easy distance of the city were offered to anybody who would clear them, at thirty cents an acre, but in the face of this offer emigration from the colony has grown steadily larger. The worst effects of the great fire are likely to come from the permanent giving up of their local business by the merchants of St. Johns.

The borough and such of the county elections as have been thus far held in Great Britain seem to indicate that Gladstone cannot secure a large and trustworthy majority in the new Parliament, and that the best he can now hope for is a narrow margin in his favor. Moreover, this small majority, if he finally secures it, will be composed of heterogeneous elements, and cannot be depended upon for effective support. It is perfectly obvious that home rule has lost much of its former hold on the public mind, and it is exceedingly doubtful whether Gladstone will be able to carry through any home-rule measure. The Irish cause has lost ground steadily ever since the first unsavory disclosures regarding Parnell were made, and the succession of bitter and bloody quarrels among his original followers ever since his downfall has disgusted many who at first were inclined to favor home rule. Even among those who still believe that home rule is wise, necessary, and inevitable, the old enthusiasm in its favor has steadily grown cool, until their equanimity will not be greatly disturbed if it should prove that it must be again postponed. While the analogy is, of course, not complete, the feeling in many minds regarding this issue has come to resemble much that which characterizes many Northern people in this country regarding negro suffrage in the South—a mood in which they frankly concede that theoretically the blacks ought to rule where they have a majority, but practically they are not disposed to complain if this right is denied them so long as they seem so unfit as now to exercise it. It must be said, however, that Parnellism as a brute force has nearly reached the vanishing point, only five members of Parliament remaining, and two of these being due to Tory help.

Among the most striking results of the recent municipal elections in France was the success of the Socialists in several important cities. They are put in complete power at Marseilles, Roubaix, Toulon, Narbonne, and Toulouse. What they think of their victory may be gathered from the terms of one of their posters, reproduced in a French paper:

"It means that Labor is at last conscious of its power and rights, and is decided to enforce them, crying out to its exploiters: 'Your reign is ended. It is I, who produce all, who should administer all; first the Commune, afterwards the State.'"

In keeping with this is the declaration of the Socialist Mayor-elect of Roubaix, who said to a reporter: "We are going to put in force, as far as possible, the programme of the Workingman's Congress at Lyons, which all the candidates on the workingman's ticket signed and which secured them their election." Asked if he thought the entire programme capable of realization, he replied that he did, and that he was convinced that it would be in force "in its entirety" before the end of his term of office, and that "to the great satisfaction of our fellow-citizens." This programme, it will be remembered, calls, among many other things, for one free meal a day for children in the public schools, and a semi-annual distribution to them of shoes and clothing; an eight hours' day, with a minimum of wages to be fixed by the City Council; free medical treatment, and drugs at "reduced prices"; free legal advice from judges in all "litigation interesting workingmen"; free lodging and food for "travellers and laborers without a fixed residence in search of work." We should say that the enforcement of a programme containing such features would bring about the greatest "satisfaction" on the part of all the Mayor's fellow-citizens who never pay any taxes.

Some of the difficulties in the practical application of "Imperial Socialism" in Germany are considered by Mr. J. G. Brooks in the *Economic Journal* for June. Under the new system of State insurance, laborers who are sick are entitled to sick-pay, and this provision is apparently having a deleterious influence upon the health of the community. Where there is a motive for being sick it is very easy to imagine a slight feeling of discomfort to be a symptom of serious illness, and furthermore the very act of attending to imagined symptoms of disease tends to make them real. Accordingly, a great amount of "simulating" is reported as taking place among the German laborers, and all sorts of remedies for the evil are proposed. Some authorities recommend that doctors who are found to be soft-hearted should not be allowed to certify as to sickness, but there are obvious objections to such odious comparisons as this. Another proposal is to reduce the amount of sick-pay, but this would be to punish the really sick for the sins of the malingerers; and, besides, the testimony of the doctors who report upon this practice of simulation is that an extremely minute pension, provided it can be depended on, is a sufficient inducement to make some men shirk labor. Some of the physicians report a startling amount of this feigned illness among workmen, varying from 10 to 25 per cent. of the cases examined.

Mr. Brooks quotes many expressions of opinion from the physicians and officers engaged in administering the law that indicate its fundamental weakness. It might almost be laid down as a principle of human nature that no one will support himself if he finds that others will do it for him. What is more remarkable than this increase of feigned sickness is that of accidents. The doctrine of "contributory negligence" not being applied under the new law, the number of accidents, in spite of the introduction of safeguards for dangerous machinery, tends to increase. The general impression derived from Mr. Brooks's extended study of the situation is that while it may be practicable for trade unions, the members of which are directly interested in guarding against fraudulent claims for illness, to check those who are disposed to cheat, this task cannot be performed by the general Government. This lesson is offered to the English by Mr. Brooks in view of the State pensioning schemes that are in so much favor there; but it seems probable that nothing will satisfy those who advocate these measures except their own experience. If that of other nations were regarded, we might suggest an inquiry into the operation of our pension law, under which most of our old soldiers have discovered that it is impossible to earn their own living, and now seem to believe that the country owes them support whether they are able to earn it or not.

THE MERITS OF THE HOMESTEAD TROUBLE.

HARDLY any one who recollects the principal struggles of recent years between workmen and their employers can have failed to be struck with the extent to which the Homestead laborers have obtained the sympathy of the classes socially above them. At the time of the difficulty between the Knights of Labor and the officers of the New York Central Railroad two years ago no such sympathy was felt. When the Reading Railroad and the Chicago, Burlington and Quincy Railroad had their struggles with their men, the sentiment of the well-to-do was on the side of the corporations. The same may be said of the coal-heavers' strike at Hoboken, of the recent pavers' strike, and of the lockout of the housesmiths. The issues in the present strife are not different, to the superficial view, from those of these previous controversies, but it is apparent that in this case the employers receive at the most a rather grudging recognition of their legal rights, while the strong support of an earnest public opinion is denied them.

What is the cause of this different attitude of the public? So far as the employers are concerned we do not see that anything is said against their treatment of their men. The village of Homestead is described as made up largely of houses owned by their workmen, their mills are fitted with all the most improved contrivances for manufacturing steel with the minimum of human exertion, they have recognized the great union of their men, the Amalgamated Association, and they have for a long time accepted a scale of wages satisfactory to this union. These wages, too, are apparently very high. The table given in the *American Manufacturer* shows wages ranging from two dollars up to more than fourteen dollars for twelve hours' work. In some of the Pittsburgh bar-mills, it may be said in corroboration of these figures, the proprietors report the average wages of rollers as over fifteen dollars a day. These wages have been increased in recent years by improvements in machinery that make labor more effective; and though they may increase indefinitely with the price of the product, they do not fall when it falls below a certain point. The reduction of this minimum was justified by the steady decline in the price of steel; it affected in any event not more than one-tenth of the men at the Homestead works, and even after this reduction the wages earned will generally, owing to the increased output, be greater than when the scale was signed. The only other point involved was a change in the date when the scale should expire, the employers, for business reasons, desiring the beginning of the calendar year, the men preferring the 30th of June, because they regard it as a more favorable time for a strike should they decide upon one. But, accepting the contention of the men, there was certainly nothing outrageous in the claim of the masters.

On the other hand, the workmen present no argument in justification of their action, of any validity either at law or in morals. They practically assert that the mills are their property, and not the property of those whose money built them. They profess to be protecting this property, but by preventing the owners from using it they destroy its value. It is not the material substance that gives its value to property, but the use that is made of it, and so far as making use of the property at Homestead is concerned, the owners of it would be as well off with a grant of land in the moon. The motive of this action on the part of the men is to make it impossible for any man to work in these mills unless they give him permission. This work they have monopolized through their Union, and they mean to maintain their monopoly. In acting upon this motive they fired upon the Pinkerton men—for it seems to be clear that the first shots came from the shore—and thereby took life without justification. They were where they had no legal right to be; they fired without the excuse which the law recognizes, and the best that they can say for themselves is that they were acting in defence of a claim to deprive rich men of their property and poor men of their right to labor. The Pinkerton men, on the other hand, were lawfully landing upon ground which they were employed by the owners to guard, and they fired only in self-defence. That they can honestly plead that they were in fear of their lives is amply shown by their subsequent fate, which rivals in horror that of the captives taken by our aborigines in their wars. Upon the whole, it must be said that the conduct of these Homestead workmen is utterly unjustifiable legally, and atrocious morally; all that can be said for them being that they have not been guilty of the crowning folly of destroying the works which have furnished them support.

How comes it, then, that these men have secured so large a measure of public sympathy? We believe it to be because the country is at last awakening to the infamous abuses which go on under the name of "protection." With a misguided patriotism, our people have consented to a fiscal system supposed to enable struggling industries to get a foothold in this country, and they now see that their mistaken generosity has resulted in putting the Government into the hands of a ring of enormously wealthy and wholly unscrupulous men. Protection is very well as a theory; but every one knows that what it means in the concrete is that a number of manufacturers agree upon such a tax as they think will compel their fellow-citizens to stop buying foreign goods and buy of them, which agreement is enacted by Congress. The people are induced to tolerate this sort of legislation by the claim of the manufacturers that it is intended for the benefit of their workmen, and this claim, in common estimation, establishes a partnership between these parties. The implied terms of this partnership are that the profits derived by the manufacturers from tariff legislation shall be shared with their men; and when manufacturers fall back upon their legal rights and say that they will discharge whom they please, and employ whom they please, and pay what wages they please, the feeling is irrepressible that they are stating their true position, and that their plea for American laborers was a mean and contemptible pretence, designed simply to enable them to enrich themselves by utilizing the credulous patriotism of the American people.

Upon this point Congressman O'Neill of St. Louis makes some observations that deserve the attention of protectionists. He says:

"Some of the newspapers fling at Senator Palmer because he said that the men had a right to employment. Now, haven't they, if this theory of protection amounts to anything? The high-tariff men say their tariff is to protect American laborers. Why haven't the laborers a right to demand the benefits of protection if it is kept up for them? If the country passes laws for the avowed purpose of protecting labor, why can't it see that the men reap part of the results?"

The sympathy felt for the Homestead laborers, therefore, is due to a feeling that their employers pleaded a partnership with them when they persuaded the people to tax themselves for the benefit of their business, and repudiated it when it came to the division of the spoils. But there is more in the matter than this. It shows the miserable results of the fundamental principle of protection, that the Government is to be used to benefit one class of citizens at the expense of another. The power in the hands of men of great wealth is already so great as to be regarded with jealousy, and when this power is employed, as for more than thirty years it has been employed by the ironmasters of Pennsylvania, to regulate the fiscal policy of the United States in their own interest, it becomes detestable.

SENATOR PALMER ON THE RIGHTS OF LABOR.

THE Senate took up the Homestead riot as a subject of discussion on Thursday, on a motion of Senator Peffer to appoint a select committee of three to investigate Pinkerton and the Pinkerton men "since their first appearance in the United States to the present time." In the course of the debate Senator Palmer of Illinois took very advanced positions on the labor question, which must lead him into the ranks of the Bellamy nationalists if he is not there already. This is rather surprising to people in the East, who had come to regard Mr. Palmer as rather conservative in his ways of thinking, he having voted against the disorganizing schemes of the silver-men in the Senate, and having taken the decisive step at Chicago which made the nomination of Cleveland certain. It becomes necessary to examine Mr. Palmer's arguments in detail, and see whether they are supported by the facts of the workaday world, and

where they would lead us if they were carried into execution.

The first thing that strikes us as open to objection, or wholly condemnable, is the Senator's habit of sheering away from his own conclusions as soon as he comes in sight of them, and taking refuge in glittering generalities of speech. Thus, after contending powerfully for the laborer's right to be hired and to remain in the service of the employer he has chosen—this being, as he acknowledges, a new class of rights springing out of the changed relations of men and things—he does not tell us where the laborers' pay, or the manufacturers' profit, if any, is to come from, or how either the one or the other is to be ascertained and adjusted. Upon these points he takes refuge in the phrases "reasonable compensation" and "reasonable profits," as though there were standards on file somewhere by which these could be determined, and also resources out of which they could be paid. Senator Palmer knows, as a lawyer, that all disputes about reasonableness which cannot be settled privately by the parties must go before a jury. Therefore his idea is that the new order of things that has been ushered in lately, requires a jury trial to determine the reasonableness of both wages and profits.

The Bellamy Nationalist party, anticipating the law's delay in such cases, knowing that the laborers might starve and the manufacturers be ruined while waiting for the verdict, have run ahead and lodged in the central government the whole power to regulate these matters. Seeing, furthermore, that no power can compel an employer to pay what he has not got, or for that matter what he says he has not, they provide that the Government shall so regulate all employment at the fountain-head that there will be just enough of everything produced to satisfy all reasonable wants and nothing over, and so that all shall be willing to work the requisite number of hours per day at the particular trades requisite to satisfy all wants. The Bellamy programme is at least comprehensible. That it is unworkable on any such planet as that on which our lot is cast is the opinion of all the recognized thinkers who have taken the trouble to look into it, but it is at least possible to see what it means and where it brings us. This is more than can be said for Senator Palmer's plan. The Socratic dialogue, if applied to him, would drive him straight into the Bellamy camp or into that of the Socialists of the school of Marx. When once there, he would be asked to show where the State is to find means to pay the workman's reasonable compensation, or the wonderful men to work the complicated machine by which all persons are to have their reasonable wants satisfied.

These would not be the only questions confronting the honorable Senator. Some people would want to know at what precise time, or about what time, the new order of things was ushered in by virtue of which the Homestead rioters had a right to take possession of the property after they had struck or been locked out. Upon this point Mr. Palmer was more emphatic than lucid, saying:

"I maintain, therefore, that at the time of the assault upon these people at Homestead they were where they had a right to be; they were upon ground they had a right to defend. Do you ask me if these men may by force take possession of the property of another? No. They were conducting themselves in the line of their rights, as I understand them. Business was suspended, and these men were simply awaiting a settlement of the disputed questions between them and their employers.

"Mark me! I maintain the right of owners of property to operate it at their will. I maintain the right of the operative to assist in its operation. I maintain the right of both parties to reasonable compensation for their services. I maintain the right of these laborers to continuous employment, dependent not up on the will alone of the employer, but dependent on the good conduct of the employees."

If there is such a thing as the right to seize other people's property and to commit an assault, it must be of very recent birth. Indeed, we gather from the telegraphic report of Mr. Palmer's speech that these rights are still inchoate, but are on the point of being established. Whether they are to be fixed by act of Congress or of the several State Legislatures, or by judicial decision, or by common consent, is still uncertain. It is to be hoped that when the time comes for defining them, they will not be restricted to operatives in iron mills, but will be made general, so that, for instance, if the hired men in a harvest field or on a cotton plantation are not satisfied with their wages, or if their employer discharges them for any reason, they will have the right to seize the farm and commit an assault on the farmer's family. Such rights could not be restricted to any class without producing a hateful aristocracy. The waiters in a dining-room ought to have the right to seize the hotel, subject, of course, to the owner's right to keep it and operate it in his own way. These two rights, being somewhat conflicting in any imaginable state of the law, the result would probably be a smashing of the crockery and a bill for damages. Who ought to pay the bill would be a difficult question to answer, but not more difficult than a hundred others that Senator Palmer raises.

OUR VARIEGATED CURRENCY.

THE letter from the *Evening Post's* London financial correspondent which appeared on Saturday, describing the apprehension felt in that city about the effects of our silver laws, showed a certain confusion in regard to our silver paper money, which is shared to a large extent in this country. The letter said: "We should like to know whether these 'legal tenders' (of the New York reserve banks) are silver certificates or solely greenbacks." The answer is, that what are technically "silver certificates" are not a legal tender. But it is probable that the London idea of a "silver certificate" includes the "Treasury notes" issued under the Silver Law of 1890. The so-called Bland Bill of 1878 provided that the holder of silver dollars issued under that act (the dollars being legal tender) may deposit them with the United States Treasurer or any Assistant Treasurer and receive in exchange "certificates," which shall be receivable "for customs, taxes, and all public dues." These are the technical "silver certificates," and there are outstanding of them $326,680,803.

The law of 1890 provides that the silver purchased by the Treasury under that law shall be paid for with "silver bullion Treasury notes." These notes are made a full legal tender, and it is provided that, "when held by any national banking association, they may be counted as a part of its lawful reserve." There are outstanding of these notes $98,051,657. It is these "treasury notes," probably, which the London financiers have in mind in the connection referred to. It may be added that the law provides that these notes shall be redeemed on presentation "in gold or silver coin." This is supplemented by the statement that it is "the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio, or such ratio as may be provided by law." Then comes the further statement that after July 1, 1891, only so much of the silver purchased under the act shall be coined "as may be necessary to provide for the redemption of the Treasury notes." Moreover, the Treasury Department issues "United States certificates of deposit for legal-tender notes," and these certificates may be, and in fact are, issued on the deposit of greenbacks or of silver Treasury notes under the act of 1890, or of mixed parcels of both. There are about $16,000,000 of these certificates in the bank reserves of the whole country.

A glance at our variegated currency, now and then, is a useful lesson, both in economic science and in the evolution of public opinion. It consists of the following things:

(1.) Gold coin. This is the foundation of the whole. Everything else rests upon it, including the standard silver dollar. The gold dollar is the "unit of value," and the only one known to the law. The meaning of the phrase "unit of value," since the silver dollar was reintroduced into our coinage in 1878, seems to be restricted to custom-house valuations, the rating of foreign coins, and other technical matters. Inasmuch as gold is the only thing in our variegated currency that stands on its own bottom, it results that gold bullion answers the same purpose as gold coin for monetary uses.

(2.) Standard silver dollars. There are about $60,000,000 of these in actual circulation, answering the same purpose as small notes. The remainder of the silver dollars, about $347,000,000, are held in the Government storehouses, most of them being represented by—

(3.) Silver certificates. According to the latest report there were, as stated above, $326,680,803 of these in circulation, and there can be no more of them. These pieces of paper are not legal tender.

(4.) Greenbacks. These are the legal-tender notes issued during the war, amounting now to $346,681,016, of which about $100,000,000 are held by the national banks as a part of their reserves. No more can be issued.

(5.) Legal tender notes under the act of 1890. These are issued in payment for silver bullion bought by the Government under said act at the rate of 4,500,000 ounces per month. With silver selling at 87 cents per ounce, the monthly output of notes would be about $3,900,000. This is a continuing operation. The whole amount at present is, as we have said, $98,051,657.

(6.) National-bank notes. These amount to $167,000,000, or thereabouts. They are not legal tender between individuals, but are such at all national banks, each bank being required to receive them at par for any indebtedness due to itself.

(7.) Gold certificates and legal-tender certificates. Not in general circulation. They are issued by the Treasury on the deposit of gold, or of either kind of legal-tender notes, for the convenience of banks.

(8.) Subsidiary coins. These it is not necessary to describe. They include everything less than a dollar that circulates as money. They are not legal tender beyond five dollars. The Treasury redeems them in legal-tender money whenever requested to do so.

The act of 1890, as already said, declares that it is the established policy of the United States to maintain the two metals on a parity with each other. This amounts to a direction to the Secretary of the Treasury to redeem everything that comes to him for redemption in gold, except the notes of solvent national banks. When a bank becomes insolvent, he must redeem its notes also.

Inasmuch as the whole structure rests upon gold, the question may be asked, Why do we have all these variations of currency? Why not have what other nations have, viz., gold and bank notes, or gold, Government notes and bank notes? The answer is that we have had a majority of members of Congress during the past fourteen years who have imagined that taking gold from the people by taxation to buy silver bullion with, and then coining this bullion into dollars and selling them back to the people at 100 cents each in gold, would cause the people to have more money in their pockets. This is the cause of our variegated currency. The experiment has been tried so long, and with such disappointing results in the way of filling people's pockets, that some observers think the end of it is not far distant.

THE BURDENS OF THE PRESIDENT.

It is disappointing, in view of Secretary Tracy's commendable action concerning appointments in the Brooklyn Navy-yard, to find him making a long speech upon the duties of the President without referring to the relief that might be had through a reformed civil service. Perhaps Secretary Tracy is too honest and too loyal to express views that might seem to reflect upon the practices of his chief, but he certainly failed to recognize the irresistible suggestion of his facts. He computes the number of postmasters to be appointed by the President at over 3,000, and the total number of offices to be filled by him at 4,556. The Presidential post-offices fall vacant at the rate of 800 a year—Secretary Tracy does not estimate how many of these are due to partisan removals—and for every office there are as a rule many applicants. The next President will have to fill on an average more than four offices on every business day during his term, which certainly ought to leave him time to do nothing else.

But the President, after considering the merits of a dozen or twenty applicants for office daily, must during the year pass upon some 550 applications in behalf of citizens who desire to have not more to do with the Government, but less—the petitioners for pardon. He had also to inform himself during the Fiftieth Congress concerning the 1,824 acts and resolutions which that body submitted for his approval. His duties in connection with the Cabinet are not insignificant, as may easily be imagined if we think of President Harrison repressing the warlike ardor of Secretary Tracy, gently correcting the errors of taste of Postmaster-General Wanamaker, or diplomatically guiding the exuberant impetuosity of Mr. Blaine. He must, in theory at least, feel a certain responsibility for committing the expenditure of a hundred and twenty or thirty millions a year to the hands of Corporal Tanner and Gen. Green B. Raum. He must, if required, shake hands with every American citizen who visits Washington; he must give and attend dinners and receptions, must occasionally write a letter, go to church, inquire after the health of his family, and if possible secure a little time for sleep.

With slight exception, Secretary Tracy's suggestions of relief do not seem to be of a nature to lead to any improvement in the Government. It might be practicable to allow applications for pardon to be disposed of according to the recommendation of the Attorney-General, but we do not see how this practice can be constitutional. It is probable that as a matter of fact these applications are disposed of in some such way, but it would require a constitutional amendment to give the practice legislative approval. Much the same may be said of the practice of accepting the recommendations of heads of departments and others specially informed as to appointments to office and as to the merits of statutes. This is done now because it is impossible for the public business to be done in any other way, but it cannot be formally recognized by legislation without conflicting with the letter of the Constitution.

As to the proposal that the appointment of officers to the Presidential post-offices should be made not by the President but by a subordinate, the remedy is worse than the disease. So long as the President can be held directly responsible, some kind of decency in the matter of removals and appointments may be exacted by public opinion. But if the President is able to say to an indignant citizen, "I have nothing to do with these matters; you must go and see Mr. Clarkson about them," reform will be impossible. Responsibility would be effectively divided, and where it is divided it does not exist. To adopt this measure would be to increase enormously the power of the party organization, which is the very power that intelligent reformers all over the country are doing their best to limit.

The true line that reform should take is indicated by the circumstances of the case. It is physically impossible that President Harrison should have direct personal acquaintance with the citizens of Texas and Oregon and Maine. If he has to appoint a postmaster in one of the towns of these States, he is necessarily obliged to consult with some of their citizens in order to learn the qualifications of applicants. The most convenient way to do is to act on the recommendation of Representatives or Senators from the different States. They at least know something of the applicants, while the President knows nothing. The practice is convenient, and, from a party point of view, desirable; but the objections to it are notorious. Yet unless some other practicable means of enabling the President to judge of the merits of applicants is devised, the present system will continue.

The remedy is not far to seek. First, the four years' law should be repealed, so that vacancies should not exist until there is a real need for a change. Then, when new postmasters are required, let them be nominated by the people directly interested. The Post-office would be quite as well served by men chosen by the people who come in daily contact with them as by men selected for political considerations, and it admits of no question that in towns of moderate size intelligence is sufficiently advanced to prevent the general recommendation of unsuitable postmasters. Other functionaries have little to do with the people, but the postmaster meets them daily face to face. They are personally interested in the selection of such functionaries, and they are entitled to have something to say about it. It is frequently the case that appointments are determined by the petition of persons using a particular office, and all that is necessary is to regulate this practice by law. The Department should be left free to refuse an appointment for

specified reasons, but in default of these the appointment should go to such men as are desired in particular localities. The requirement of a proper bond and the retention of the right of dismissal for cause would protect the interest of the Government, and the right of petition for the removal as well as the appointment of postmasters would protect the people.

THREE YEARS OF REPUBLICAN FINANCIERING.

THE 30th of June brought to a close the third year of control of the national finances by the Republican party since its last accession to power. A review of the financial methods and results which have marked this period of three years is naturally suggested at this time.

The great question which troubled Secretaries Manning and Fairchild and, for a time, Windom, was, what to do with the enormous Treasury surplus; the thing that puzzles Secretary Foster is, how to stave off a little longer a Treasury deficit. On June 30, 1889, the surplus available cash in the Treasury was $127,000,000; on June 30, 1892, Mr. Foster reports his net cash balance at $26,692,377, of which $14,224,714 is in unavailable subsidiary coin. The surplus is gone, sure enough. Fairchild's $127,000,000, together with $247,000,000 of surplus added in three years and the $54,000,000 of the bank-note redemption fund turned over to the Treasury by the law of July 14, 1890, has come down to $12,000,000; and how even that narrow balance on the right side has been artificially obtained we shall presently show. The Republicans have found the surplus so much "easier to handle than a deficit," in Col. Fred Grant's historic phrase, that it has altogether disappeared under their expert manipulation, and they will soon have a chance to try their skill on a deficit.

In his annual report for 1887, Mr. Fairchild passed in review the various expedients for preventing taxation from exceeding the expenditures of the Government. He mentioned: purchase of the interest-bearing debt, larger expenditures by Government, reduction of taxes. To the first he gave a qualified approval, as the main instrument then within the power of the Secretary of the Treasury, pointing out, however, that the apparent saving of interest was really a losing transaction to the people, "the measure of loss being the difference between the worth of the use of the money to them and the interest saved on the bonds cancelled." He proceeded:

> "I cannot believe that unselfish statesmanship will adopt the second expedient, viz., the enlargement of Government expenses simply to expend money raised by taxation, when the public weal does not otherwise call for the expenditure. Every dollar taken by taxation from the man who has it employed in a business which the natural wants of the community call for, and carried into the Treasury, even if at once paid out again to satisfy obligations created by law in excess of the healthy needs of the Government, is a dollar used to misemploy labor and to impoverish the people."

His natural conclusion was that reduction of the revenue from taxation "is the only fit remedy for the evils which threaten the country."

What methods have the Republicans followed in their too successful reduction of the Treasury surplus? First, the purchase of national bonds. They chose that means in spite of the fact that Secretary Windom, in his first annual report—that for 1889—declared that "it is manifestly wrong to take money from the people for the cancellation of bonds, to the saving of only about 2 per cent. of interest, when it is worth to them perhaps three times as much in their business. It is rather through a reduction of customs receipts and internal taxes that an unnecessary accumulation of money in the Treasury should be avoided." Between March 4, 1889, and October 31, Mr. Windom purchased bonds to the amount of more than $66,000,000. During the fiscal year 1889–90 he bought about $100,000,000 more. In the year 1890–91, $134,000,000 additional was paid out for the same purpose. In this way we account for the disappearance of about two-thirds of the surplus of over $400,000,000, of which the Republicans have had the disposal. The rest has gone in that "enlargement of Government expenses" which Secretary Fairchild could not believe in 1887 would be adopted by "unselfish statesmanship" as an expedient for getting rid of the surplus. The total ordinary expenditures of 1888–'89 were $281,996,615; of 1891–'92, $361,348,669. Moreover, in the former year all appropriations were paid; in the latter, according to Senator Allison, $87,000,000 of the appropriations remain unpaid. In 1888–'89, civil and miscellaneous expenses were $73,000,000; three years later, $99,000,000. Then the pension bill was $87,000,000; last year it was $134,000,000, and next it will be $160,000,000. These two items show the main and unjustifiable increase; in the others—the outlay on the army and navy and the Indian service—the advance has been no greater, perhaps, than the growth of the country called for.

Secretary Fairchild's last estimate of income and expenditures and consequent surplus proved so accurate as to extort a compliment from his Republican successor in the Treasury Department. Last December Secretary Foster estimated the surplus at the end of the fiscal year at $24,000,000. He was only $28,000,000 out of the way, as his surplus turned out to be a deficit of over $4,000,000. A slight mistake like that will not disconcert a man of Mr. Foster's make-up, who is rather disposed to dwell upon the immense success of his efforts to stave off the payment of $87,000,000 more, for which the laws have made the Treasury liable. The bills for that amount will finally be presented and must be paid; but he comforts himself by reflecting that perhaps the election will be over by that time, and then it will make no difference.

It is only fair to say that the force of the argument which might be made against the Republican party for its extravagance and incompetence in financial matters has been impaired, for Democratic uses, by the record of the present House. Its monstrous River and Harbor Bill is a piece of indefensible extravagance. Yet, when all is said, apart from this item the appropriations by this Congress have been as economical as possible under existing laws. The pension laws call for an appropriation of $150,000,000, and so long as no one can be found with nerve and patriotism enough to bring about a repeal of the wasteful and demoralizing provisions of those laws, there is nothing to do but to vote the millions demanded. Some other pieces of extravagant Republican legislation were deliberately made a "continuing appropriation," for the express purpose of fastening the expenses they entail upon a Democratic House. For the last year the total amount of such permanent appropriations was $122,486,808. Add that compulsory sum to a compulsory pension bill of $150,000,000, and there is not much margin left for economy.

THE BRITISH ELECTIONS.

THE London constituencies, Birmingham, Bradford, Bristol, Edinburgh, Glasgow, Hull, Leeds, Liverpool, Manchester, Nottingham, Salford, Sheffield, and Wolverhampton, being all the places which, under the existing distribution of seats, return more than two members each, will be represented in the new Parliament by sixty-seven Conservative or Liberal Unionists, as against forty-five Home Rule Liberals. The figures show a great change of sentiment since the time, not so many years ago, when the large cities were, with few exceptions, Liberal strongholds, constant to the party even when the rest of the country decided against it. After the Tories, under the leadership of Mr. Disraeli, in 1868, by extending the borough franchise, took their "leap in the dark," the cities above named, being then entitled to forty-eight members, returned no less than thirty-nine Liberals and only nine Conservatives. Of course the secession of the Liberal-Unionists on the Irish question has been in part responsible for the change in sentiment that results in the return of what is practically a Tory majority from places which, less than a quarter of a century ago, sent to the House more than four Liberals for every Conservative.

In some places the opposition to home rule has operated with most disastrous results to the Liberal cause. In Birmingham it has wrought a literal revolution. Prior to 1886, the Radical metropolis of the Midlands had never returned a Conservative to Parliament. So overwhelming was their majority that its Liberals were able, in spite of the device to secure minority representation contained in the Reform Act of 1868, to elect at every one of the three general

elections held while that act was in force all three members. Even in 1885 the Liberals polled 33,000 votes to 23,000 cast for the Conservatives—that is to say, as late as seven years ago it was relatively about as strongly Liberal as New York city is Democratic. Yet every representative in the new House, as in the one just dissolved, will be a supporter of the Salisbury Government, and in the five divisions in which alone the Liberals ventured to make a contest, the Unionists polled 29,000 votes, as against but 13,000 cast for the Gladstonian candidates.

Still, strong as the Liberal-Unionists are in particular localities, their strength is by no means generally diffused, and it is usually great only in constituencies in which the united Liberal party formerly had a heavy majority. In many Conservative neighborhoods the Liberals are stronger than they were before the home-rule controversy arose. Warwickshire furnishes a curious illustration of this fact. There are, inclusive of the seven of Birmingham, ten borough seats in this county. In 1885 they returned 9 Liberals and 1 Conservative. In 1892 they returned 9 Unionists and 1 Liberal, and the lone Liberal comes from the same constituency which in 1885 returned the solitary Tory. The Liberals, overwhelmed everywhere else, have "gone to Coventry" and captured the borough from the Tories, who in 1885, when themselves as unpopular in the neighboring constituencies as the Liberals now are, found there a refuge.

Exclusive of Birmingham, Glasgow, and Edinburgh, the Liberals in 1892 carry in the large cities three more seats than they did in 1885. Outside of the three places named, prior to 1885, other causes than Liberal differences as to Ireland must have been at work to reduce the Liberal strength. One of the first evidences of a coming change of opinion in the great centres of population was shown when in 1874 the City of London first became definitely Conservative—a faith in which it has since become more and more confirmed. It was principally due to this loss of the City that, even in 1880, Mr. Gladstone did not get quite as many seats in the larger places as he had done twelve years before when his majority in the country as a whole was smaller. Still, in 1880 he carried 37 such seats, as against but 11 held by Tories. The Redistribution Act of 1885 more than doubled the representatives of these places, increasing the number from 48 to 112. Had political opinion in them remained unchanged, this increase of their representatives would have added greatly to the Liberal strength. In fact, however, it had precisely the opposite effect, and instead of a Liberal majority among their members of Parliament of more than three to one, as in 1880, the Conservatives actually returned 59 members as against but 53 Liberals. Some seats were lost by the transfer, under Mr. Parnell's orders, of the Irish vote from the Liberals to the Tories; but, allowing for such losses, it is obvious that between 1880 and 1885 there must have been a great change in the political opinions of very many of the voters in these cities.

Whatever was the cause—whether it was disapproval of Mr. Gladstone's management of foreign affairs, the increasing popularity of the Tory Democracy, or what not—the effect was indisputable, and was not confined to the larger places. The British boroughs in 1880 gave a Liberal majority of 149, and in 1885 cut it down to 28. Had not the enfranchisement of the agricultural laborers brought about an equally striking counter revolution in the counties in which the Conservative majority of 35 in 1880 was turned into a Liberal majority of 75 in 1885, Mr. Gladstone would have been defeated in the latter year almost as signally as he defeated the Earl of Beaconsfield in the former. This change in the political complexion of the boroughs seems likely to be a permanent one. In the new Parliament, although the Unionist majority of 88 in them in 1886 will be reduced to about 18, there will still be, as compared with 1885, a loss of 23 seats counting 46 on a division, and of no less than 80 seats as compared with 1880.

The elections give new proof that, in Anglo-Saxon countries at least, the size and enthusiasm of public meetings and the extent to which the streets are thronged with cheering thousands furnish no safe indications of the real drift of opinion among the great mass of the quiet voters. Never was Mr. Gladstone more enthusiastically received in Edinburgh than during the campaign just closing, and yet the result of the polling shows that his party in that city is not only far weaker than it was in 1885, before the home-rule controversy had divided it, but that, relatively at least, it has lost ground even since the general election of 1886. The Scotch capital has always been a Liberal stronghold. It has, we believe, never returned a Conservative to Parliament. In 1885, out of 27,271 votes polled, but 4,231 ballots were cast for Conservative candidates, although doubtless there were a number of Conservatives who, in the districts in which they had no party nominee, voted for the Liberal candidates least objectionable to them, and thereby somewhat exaggerated the apparent Liberal strength. In 1886, when Mr. Gladstone appealed to the country on the home-rule issue, the opposition vote more than doubled, rising to 9,763, while that of his supporters fell to 13,625, or only a little more than one-half of what it was but eight months before. In the last six years, to all appearances, the Liberals were regaining much of their lost ground. The single Unionist elected from Edinburgh to the Parliament of 1886 became a convert to home rule, resigned, and recontested his division in the Liberal interest, and turned a Unionist majority of 690 into a home-rule one of 46. Now, however, when the final test comes, it appears that, in the six years, the Gladstonians have increased their vote only 1,723, as against an opposition gain of 2,806. West Edinburgh has again returned a Unionist, while the Liberal majority in South Edinburgh, which in 1886 was 1,587, has been cut down to 220.

THE "AGAMEMNON" AT BRADFIELD COLLEGE.

OXFORD, June 25, 1892.

THE valley of the Thames is never more full of summer than on these pleasant days of June, when the larks are rising from its hills, and its hedgerows are filled with the staccato notes of the yellow-hammer. Suppose that a company of idlers are floating down the Isis from Oxford, and let one of them, grown tired of his narrow boat, make for the river-bank at Pangbourne. There—if his landing had happened last Tuesday afternoon—he might have found me hurrying out of a dusty train which had left Oxford an hour before, and his more leisurely journey by water would have been admirably in keeping with the rest of my expedition to Bradfield. From Pangbourne we drove through pleasant avenues of limes, past little clusters of thatched cottages, and fields white with ox-eyed daisies or golden with buttercups. Before the fourth mile ended, we noticed on our right hand a picturesquely overgrown chalk-pit, and stopped a few minutes later at a wicket gate leading down into a second chalk-pit. But the place was so hidden and embowered by trees that nothing but a wooded slope appeared.

At this roadside gate strange things were happening, for there seemed only one way of gaining admission to this English chalk-pit. You had to produce a square blue card upon which Greek words were written. As you descended the narrow downward path, darkened by overarching foliage, a cushion somehow found its way into your hands, and then came a surprise. A sudden and sharp turn to the right revealed a crowd of people seated in a Greek theatre. Above them was the sky of England framed in by the branches of trees, but you and they seemed to be in another world. What could this countryside gathering be if not a festival-meeting held to honor Dionysus in some rural township of Old Attica? We sat in circles around the altar of Dionysus, there was no roof, there were no foot-lights, no stage paraphernalia to make us into workaday play-goers. The pleasant-mannered boys in mortar-board caps and black gowns who had received and guided all comers, bore white wands which seemed to have a magical power to break down the barriers between past and present.

Soon a signal was given by youthful trumpeters from the ledge above our heads; then appeared a priest at the door of the house of *Atreus* and *Agamemnon* which faced us. When he had commanded silence and disappeared, *Clytemnestra's* watchman began the tale of his year-long vigils on the palace roof. At last he espied the beacon from Troy, and his shouts stirred up a tumult within the house. In wild excitement youthful figures clothed in the graceful Greek dress darted from its doors across the stage, and were followed by women and older men. As these retired, the music of a harp and a flute was heard, while the elders of Argos marched in. *Clytemnestra*, in-

suing from the palace, found them gathered in the orchestra and confirmed the great news that Troy had fallen. The simplicity of the accompaniment to which they chanted their songs all in unison; their uncomplicated dances, which often recalled the rounds of May-day festivals—everything the chorus did, served to mediate between the drama in progress and the assembly of holiday-makers, which was never allowed to fall away from the performance into the attitude of an "audience." Like pious Athenians of old, we had each a part of our own in the function at hand. Thus a strange hold was given to the beauty and majesty of the story as it ran its course, and little if anything in the manner of the performance stood between us and that mysterious power which in this, as in all great Greek tragedies, conquers the spirit of man until he is possessed by an element larger than himself. The frank and youthful enthusiasm with which the boy actors of Bradfield threw themselves into their parts was rarely ill-judged, and served to bring out into bold relief the great outlines of the drama. *Agamemnon* arrived in his chariot with *Cassandra* cowering behind him. *Clytemnestra* appeared and beguiled him, though loath, to tread upon the purple strewn by her maidens. The Chorus spoke often of forebodings which were shared by us all when, with a word for *Cassandra*, the king of men went in to his doom. *Cassandra's* agony of prayer and her prophetic cries alarmed not the Chorus only, but all who were listening. When she also disappeared, there was a universal shudder, so that we wondered to see how carelessly a "shiftless little swallow" fluttered down from an overhanging bough and perched for a moment on the peak of the house of *Atreus*. Then were heard groans and shrieks from within, and, just as the elders of the Chorus were about to dash into the palace, *Clytemnestra* appeared, flung open the doors, and stood exulting in her crime and pointing to her slain.

The total effect of this representation of the "Agamemnon" by Dr. Gray, Warden of Bradfield College, and his pupils, was more nearly that of an ancient Greek ceremonial performance than anything which has yet been seen in our day. This is true in spite of details to which objection must be made. The rather theatrical and over-precious prettiness of the Apollo of the Belvedere looked uncommonly foolish when *Cassandra* turned toward it in anguish and prayer, and the spectacle of slaves, harnessed under the lash to draw in *Agamemnon's* chariot, suggested the habits of Persian rule rather than any Athenian conception of the heroic ways of the king of men. A lingering attachment to unreal traditions confined actors and supernumeraries to the stage, which was therefore very often unsuitably crowded when the orchestra stood comparatively empty. It was strange to see a chariot and a band of returning veterans emerging from a narrow side door and blocking one-half of the raised stage when the outside approach to the palace through the orchestra was open and unused. The stage at Bradfield had been refashioned for this play, and the old-fashioned notion (based upon a misunderstanding of Vitruvius) that the stage was something more than a portion of the orchestra, raised more or less to suit the setting of the drama in hand, had apparently been abandoned. Having gone so far, and not too far, like those who abolish the stage altogether, Dr. Gray might well have taken a hint from Dr. Dörpfeld, and could have increased the effectiveness of his stage-setting by making his actors use the orchestra as freely as his chorus used the stage.

But, after all exceptions have been taken in detail, the wonderful impression made as a whole by the "Agamemnon" at Bradfield remains. Only in such an open-air theatre can we feel to any full extent the deep religious undertone which characterizes every great Greek play. In such surroundings only will the powers of nature anciently personified in Dionysus weave themselves into the tragedian's story. It was therefore a most happy inspiration which led Dr. Gray to transform a corner of the demesne of Bradfield College into a Greek theatre. What he began in 1890 for the performance of the "Antigone" then given, he has now brought far toward perfection. His guests at this year's three performances have to thank him for the unique opportunity of witnessing a Greek dramatic service under just the circumstances and in just the posture of mind and body most favorable to the understanding of its Greek quality. Furthermore, they owe to one much younger than he, who is a scholar-elect of Corpus at Oxford, a remarkable performance of the rôle of *Clytemnestra*. It was no fault either of the Warden or of his pupils that we were rudely reminded of our latitude just when *Aegisthus* entered at the close. A drizzling rain descended, and the spell was broken by the very elements that had been weaving it around us. Let us hope they will be more propitious today for the third and last performance at Bradfield.

LOUIS DYER.

A GERMAN JACOBIN.

PARIS, June 23, 1892.

'A PRUSSIAN IN FRANCE IN 1792: Strasbourg, Lyons, Paris'—such is the title given by M. Laquiante to his translation, just published, of the letters of J. F. Reichardt. The name was not altogether unfamiliar to me. Reichardt was in 1792 the principal writer in the *Musical Journal* of Berlin. His letters were published in two volumes in Berlin, at the end of 1792, and in 1793. And what volumes! The title-page of the first is adorned with a red liberty cap and two tricolor cockades; the author has adopted a pseudonym and calls himself "Frei." These ornaments disappear, however, in the second volume, in the year 1793, the year *par excellence* of the guillotine. The book has become rare. Reichardt was accused of Jacobinism, and lost in 1794 his place of Capellmeister to the King of Prussia. His letters on France are those of a disciple of Rousseau, of a friend of France, of a friend of the French Revolution. He was brought up as a musician, and was appointed Capellmeister at Berlin at the early age of twenty-three; as such he was Director of the Italian Opera. In 1785 he visited Paris, with introductions from Gluck; he returned to Prussia, made several other journeys to France, and became a member of the French Institute.

The correspondence now published begins on January 6, 1792, at Frankfort on the Main. Reichardt meets several French *émigrés* and has very little sympathy with them; his heart is on the side of the Revolution. The German population of the Valley of the Rhine had no more sympathy than he for the *émigrés*. "In almost all the towns, but especially at Coblentz, the *émigrés* are obliged to pay double or treble, and always in advance; otherwise people refuse to lodge or feed them." The Prince de Condé, on leaving Speyer, said: "This German rabble knows how to behave towards its little princes; it does not know how when it has to deal with princes of the blood." In the Palatinate, the French who had no domicile could not remain more than twenty-four hours in the cities. "Among the host of Frenchmen who established themselves in Heidelberg with their families when the agitation began in France, there are many whose ancestors devastated this country." Reichardt speaks of the ruins of the castle of Heidelberg, and wonders what the French think who contemplate them. At Bruchsal, the residence of the Bishop of Speyer, the *émigrés* were not tolerated. Reichardt has no sympathy for the ecclesiastical electors or the German princes. "Our princes ought to pray that the French do not cross the frontier. The peasants of the Palatinate and of Mayence say boldly: 'As soon as the French come, we will join them.' At Bruchsal the oppression is as hard as it can ever have been in France."

In January, 1792, Reichardt is in Strasbourg, and puts a tricolor cockade on his hat. He goes immediately to the Club of the Friends of the Constitution, and makes the acquaintance of the supporters of the "good cause." Among them was Schneider, who has since become legendary in Alsace. Born in Bavaria, he made himself a monk (of the order of the Récollets) at the age of twenty. He was a good speaker, and, taking the name of Euloge, he became preacher at the Court of Stuttgart and Professor at Bonn; the Mayor, Dietrich, called him to Strasbourg, where he founded a paper, the *Argus*, and became the chief of the demagogic party, and upset Dietrich, his protector. In 1793 he was appointed public prosecutor, and acquitted himself of his functions with such ostentatious cruelty, vanity, and license that the Convention was forced to have him arrested and conducted to Paris. He had the impudence in his prison to say a word against Robespierre, during the trial of Dietrich, whom he accused with savage passion. Robespierre sent the "German priest" to the guillotine.

It is curious to see Reichardt among Dietrich, Schneider, and others, before all these events, conversing quietly with Dietrich at the "Freibürgerstube," or applauding Schneider at the Club. Dietrich was a partisan of constitutional government. He was really for thirty months the master of Strasbourg; he opposed the Jacobins; he decided the local assemblies of Alsace to vote in favor of a monarchical constitution, and this vote was the signal for persecution. He was arrested, and died on the guillotine December 29, 1793. Among the men whom Reichardt met in Strasbourg was Marshal Luckner, a veteran of the Seven Years' War. "Luckner, with his small stature, his vulgar physiognomy, seemed to me pitiful. Think that this man, in this country of equality, where all decorations except one have been suppressed, wears three foreign orders on his breast." Luckner was placed at the head of the Army of the North and gained a victory over the Austrians. This did not prevent him from being arrested and guillotined on the 4th of January, 1794. Again, among the persons of note whom Reichardt met in Strasbourg was the eldest son of Marshal de Broglie. Victor de Broglie had attached himself to constitutional ideas; he was matriculated in the Alsatian nobility, as he had married Mlle. de Rosen, who was descended from the Swedish Rosen, and had brought him a marquisate. Broglie did not go far enough in the revolutionary direction; he was opposed to the suspension of the King. He would not emigrate, however, as his father had done. He was arrested in 1794 and

guillotined, at the age of thirty-seven, in 1794.

Alasce was less enthusiastic for the Revolution than appeared at first sight. The old nobility had always been very popular, as they lived among the people. Turckheim was elected Mayor of Strasbourg in December, 1792, by an almost unanimous vote. He was the chief of the aristocratic party. The *procureur-général-syndic* (a sort of a prefect) was Levrault, who was hardly thirty years old, and whom Reichardt describes as a very superior man. He belonged to the Constitutional party, and in 1793 he had to flee to Bâle to save his head; he became afterwards a great printer, and died in 1821, rector of the Academy of Strasbourg. M. Laquiante gives in his notes a very interesting letter of Mirabeau's to Levrault written in 1788. He announces in it the meeting of the States General: "What I prophesied has happened; if you don't want them, said I to the Government, on foot, they will come on horseback. What will they do? Many foolish things; but never mind. Nations get into shape like children; they must have their colics, their toothaches, their wailings." The civil constitution of the clergy profoundly divided the Alsatians. Less than one-tenth of the Catholics consented to take the oath of obedience to this new Constitution; the non-jurors were thrown into prison, many of them died in the hulks at Aix or on the guillotine. Dietrich and his friends looked upon the non-jurors as mere fanatics; almost all the Constitutionals were Voltairians. The theatres are always representative of public opinion. Reichardt one day delights himself at an operetta, "Les Rigueurs au Cloître." It is the history of a nun who is ill-treated in her convent because her love-letters have been found. The liberator appears in the uniform of an officer of the National Guard. He reads the decree which abolishes the monastic vows and takes the nun to her lover, a good patriot.

From Strasbourg Reichardt went to Lyons by way of Colmar, Bâle, Nantua. Some noise in the theatres, some bad patriotic plays, were the only marks of the political revolution he found in Lyons. He paid a visit to the Club of the Jacobins: "The company consisted of people of the lowest class; no debates, only denunciations and libellous calumnies. The whole thing seemed to us very disgusting." The laboring population of Lyons took no part in these proceedings.

In Paris Reichardt rushes to the Assembly, in session at the old riding-school of the Tuileries. In the evening he goes to the Club of the Jacobins. He gives us portraits of Condorcet, of Vergniaud, of Brissot, and a few others. "Vergniaud, certainly the most serious and the most vigorous of the popular orators, has an unpleasant face, but one that bears the marks of force and energy. His whole person gives the same impression, though he is neither tall nor distinguished. Vergniaud dominates all his colleagues by his knowledge, his passion, his eloquence." Reichardt, on the whole, though he was what the French call *naïf*, and was led away by his great admiration for the French Revolution, is rather impartial in his judgment of men; he discerns the charlatan in Pétion, the Mayor. "In front of the procession walked, his hat under his arm, Mayor Pétion, a personage of a fine appearance, with broad shoulders and a flat face showing as much vanity as phlegm." He gives, moreover, *in extenso*, a speech by this Pétion, which is absolutely ludicrous. Reichardt is an admirer of the *Père Duchesne*, the most popular paper of the time, which spoke the coarse language of the Halles. His letters read like newspaper articles, and, in my opinion, very poor articles; they have a sort of heavy stupidity which only at times becomes laughable, and their dulness is relieved here and there only by a little *trait de mœurs* which is interesting as showing the temper of the people.

It is clear to me that General Lafayette did not care to make the acquaintance of Reichardt, who made several attempts to see the General, but always unsuccessfully. He avenges himself by writing—

"Notwithstanding all I have read and heard of Lafayette, I cannot form a clear idea of his character. He is suspected by both parties. This is well expressed by an engraving which you see in every shop-window. Lafayette is hanged; an aristocrat drags him by one foot, a Democrat by the other. . . . He has made himself odious to the Jacobins. . . . Such conduct is not clever in a man who has, at least in appearance, the same object as the Jacobins, viz., maintenance of the Constitution, resistance to the machinations of the Court and of the *émigré* princes who wish the restablishment of the old régime. . . . So far he has too much liked to be spoken of and to figure in the front rank."

Reichardt sides entirely with the Jacobins, though there remains in him a certain *fond* of *bonhomie* and of good sense which comes out here and there. He blames the aristocratic men of letters who are not revolutionists —Marmontel, Suard, Barthélemy, Grimm. He puts on the red liberty-cap; he, however, describes Robespierre with some severity: his haughty demeanor, "his pale face, his sly look, render even more provoking the impertinence of his attitude." He recalls Goethe's epigram—

"Jene Menschen sind toll! So sagt ihr von heftigen Sprechern
Die wir in Frankreich so laut hören auf Strassen und Plätzen.
Auch mir scheinen sie toll; doch redet ein Toller in Freiheit
Weise Sprüche wenn, ach, Weisheit in Sklaven verstummt."

Sometimes Reichardt is well inspired; his final judgment on all he has seen is remarkable: "I am obliged to confess that the French nation is less enlightened than I thought. The qualities which give it precedence over the other nations which I know, are more due to a happy natural disposition and to the gentleness of its manners than to intellectul culture." He sees clearly that there are no real political convictions, no real devotion to the new Constitution. He deplores the lightness of mind which is a trait of the national character: "It is impossible for a young Frenchman to seize a serious idea conceived in a dry form." He perceives that "the ignorance of the lower classes is incredible, and in the higher classes it is not rare to meet men devoid of any notions of the importance and government of foreign countries." This picture, which is in the letter of April 2, 1792, deserves to be read *in extenso;* it is very exact, and, on many points, as exact in 1892 as it was in 1792.

Correspondence.

THE DEMOCRATIC CANDIDATE FOR VICE-PRESIDENT.

To the Editor of The Nation:

Sir: I don't quite understand your very complimentary reference to Mr. Stevenson, the Democratic nominee for the Vice-Presidency. Of course you recognize him as one of the leading officials in the Post-office Department under President Cleveland, and as a very active, handy man with the headsman's axe. In fact, the only man who has ever kept up anything like his record was Mr. Clarkson. Out in this country we recognize it as a victory for the enemies of civil-service reform, although his probable part will be a minor one during the next four years. Isn't there something wrong about your notice?

Yours truly, E. G. Cooley.

Aurora, Ill., July 1, 1892.

[Nothing wrong, because we were speaking only to Mr. Stevenson's personal character as vouched for by his political opponents; and to his mental calibre, in striking contrast with that of his rival, Gray of Indiana. If we could also have praised his views of office-holding, we would have done so; but it is fair to remember, even in his case, that the Administration which he served found the civil service filled with Republicans almost exclusively, and barred to men of other party opinions and affiliations, and that Mr. Cleveland approved of an immediate, though not precipitate, series of removals and substitutions until something like an equilibrium as between Democratic and Republican incumbents should be reached. In this we consider he made a fatal mistake of expediency, as the good of the country demanded of him not an equitable redistribution of the offices, but an instant abandonment of the spoils system—*i. e.*, so far as in him lay, the taking of all appointments out of politics. Mr. Stevenson's rectification inevitably paved the way for Mr. Clarkson's, and what has been gained?—Ed. Nation.]

ROLLING-MILL PROTECTIONISM.

To the Editor of The Nation:

Sir: The average voter determines, it is said, the policy of a democratic country like ours; but what he really thinks and believes can only be determined on the day after a general election. A small section of average men, however, can be studied profitably, if one takes time. I have had the curiosity to study the political opinions of a number of rolling-mill protection Republicans with a view to finding out their actual private belief on the subject of the tariff. They consist chiefly of people employed in the mill or indirectly making a living therefrom. The majority of the club which in particular I studied have a fair common-school education, but are unaccustomed to weighing arguments and debating questions logically. They are honest, thrifty, patriotic citizens, and the kind of people an innocent man would like to have on a jury where the merits of the case could be decided by the heart rather than by the head.

The following is, I believe, a correct exposition of their views on the tariff and kindred subjects.

(1.) The war is over and there is no immediate danger of a Southern invasion. (Still, the Democratic party, on general principles, may not be any too patriotic now.)

(2.) The word protection means a great deal: people protect themselves from cold and rain, and we should protect ourselves from foreign competition. (This is a general underlying idea and not to be pressed too closely.)

(3.) If the tariff is lowered, the mills will

close and we must starve. (This is a favorite scare argument. Citing instances of previous similar declarations, subsequent reduction of tariff, followed by increased output and extension of mills, is useless. This argument works well with newly arrived Swedes, Poles, and Germans; the more [politically] ignorant the man, the greater its effect on him.)

(4.) Granting that the manufacturers get higher prices for goods under a protective tariff, it follows that, as they are thus enabled to, they will pay higher wages to their workmen. (This assumption that the manufacturer will pay more for labor simply because he has more money to his credit in the bank, is rarely stated in so many words; but a vague yet persistent notion often crops up in discussion, that the boss will "divvy up" the profits with his men; he ought to—therefore he will.)

(5.) Statistics (source and trustworthiness unexamined) show that protected American workmen receive more money than free-trade English workmen. If we have free trade, we shall come down to their level. (Comparative purchasing power of money in different countries unknown, and comparison of wages between free-trade English workmen and protected Continental workmen suppressed or misunderstood.)

(6.) The doctrine of protection is American and patriotic; the Stars and Stripes and a high tariff go together. Hurrah, boys, etc.! (Comment unnecessary.)

Generations to come will probably laugh at the above sophistries, as we now laugh at Sir Robert Filmer's thesis.

EDWARD L. MORSE.

AMERICAN DIPLOMACY IN TURKEY.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to an article in your issue of June 16 on "The Troubles of Americans in Turkey," which contains an implied censure of our State Department and of our present Minister in Constantinople. Without entering into a lengthy reply or an explanation of the causes of the present troubles (which I might do), I should like to say from personal information that the present Administration has not been less firm than its predecessors in protecting the rights of our missionaries in Turkey; and as for the efficiency of our present Minister, Hon. Solomon Hirsch, I am glad to state that he combines fine business qualities with a sound judgment, decision of character, and firmness of will, and it is no exaggeration to say that in point of ability he is far superior to any Minister that we have had in Constantinople for many years. In saying the above I feel that I am voicing the almost universal verdict of the American missionaries in Turkey.

Very respectfully,

Z. T. SWEENEY.

COLUMBUS, IND., July 1, 1892.

[We merely reported an *express* censure of the Administration, uttered by a high authority on Turkey, and took pains to disclaim for ourselves any means of judging either its conduct or that of Minister Hirsch.—ED. NATION.]

THE RUSSIAN PROFESSORSHIP.

TO THE EDITOR OF THE NATION:

SIR: As Mr. Dole and Mr. Wiener have seemed not to have grasped my exact meaning in regard to the Russian professorship, allow me to state my position with a little more definiteness on the points which they have raised. I take them in the order in which they are printed in your issue of June 30, so far as possible.

It is probable, as Mr. Dole remarks, that a professor of Russian would not be likely to be overrun with pupils. But it is certain that what few pupils he had would go to him, primarily, for the sake of acquiring a practical working knowledge of the pronunciation and an ability to understand the spoken tongue, with a view to continuing their studies in Russia itself so soon as they should be qualified to do so. I am assuming, of course, that the supplementary study in Russia includes the merely superficial, polite acquaintance with the current literature for which university students in French, German, and other modern languages are prepared, as well as the more profound researches which one in a thousand might feel moved to make, as in the case of the other languages mentioned. It is only when a student attacks the dead languages, such as Sanskrit, Latin, and ancient Greek, that these practical considerations can be set aside, and an American professor considered as permissible. In short, with the dead languages, an American may be a very much alive, whereas, with the living languages, he is generally the deadest sort of a teacher, and is responsible for the vast amount of ridicule which the American nation reaps abroad among cultivated foreigners, who cannot comprehend the stupidity of learning any language except from a native of the country in question.

There is no necessity for the Russian professor to be an adept in the pronunciation of anything except Russian. But the other languages and varieties of the Slavic which I mentioned possess more or less literary monuments, which he should be able to read at first hand. Slight as is the difference between some of them, I could name cultivated Russians of my acquaintance (not to mention Americans) who are unable to cope with them. Some of my friends cannot read the Slavonic, which is indispensable to a professorship, though they understand the church service in it, as Italian Roman Catholics understand the Latin service, but more perfectly. Others of my acquaintance cannot read Little Russian, and this sort of inability is so widely extended that Turgeneff translated Little Russian authors into the ordinary Russian for the benefit of his countrymen. The Imperial Geographical Society found it worth their while to send an expedition into the Southwestern provinces (Little Russia, Ruthenia—they are synonymous), and make and publish an immense number of folk-songs, ballads, and legends at the expense of the Government. The same sort of material has been collected, to a greater or less extent, in the case of all the languages which I mentioned. I happen to be pretty well posted on this matter, as I read, literally, thousands of pages of it, in all the varieties of dialect and tongue, for Prof. Francis J. Child's great work on the English Ballads. Moreover, in 1887, I was invited by Mr. Justin Winsor to classify and prepare for cataloguing a vast mass of volumes, in all the various tongues, which had long been accumulating in the Harvard Library, and lay utterly useless to every one for the lack of a person who could even assign titles. I do not mention my own powers (which are somewhat unusual, I am told by Russians) of reading all these things, with any personal aims or interested motives on behalf of any one else, but simply to prove that I know what I am talking about.

What Mr. Dole says in regard to the abundant leisure which the future Russian professor will enjoy, after attending to his tiny flock, and of the use which might be made of it, is also true; but his deductions in this case are as false as in the other. A Russian professor, properly qualified by birth and years of previous study at home, would, indeed, be capable of continuing his researches on the base of his past and giving the world something valuable. But how is an American to effect this? After years of study abroad—which some aspirants would expect the University to pay for—he might make a beginning, provided he knew the languages I have mentioned to start with, for the philological part of his work. The only libraries in this country which can pretend to furnish even the rudiments for his investigations are those of Harvard and Yale. (The late Eugene Schuyler gave Cornell a considerable miscellaneous collection of Russian books; but I am not aware that Cornell has attempted to complete it, or to compete with Harvard or Yale on this ground.) When it comes to publishing, the Russian, by life-long training and custom, has so distinctly the advantage over the American that it is hardly worth while to take the latter into consideration at all. The American, thanks to having received what superficial instruction he may be lucky enough to possess of foreign tongues, from American professors, as is advocated in this case, will infallibly write in English—very likely, in bad English, as translators frequently write. The Russian would issue his learned treatises in Russian and French, or in French alone, as has long been the practice with his scientific fellow-countrymen. They would thus be accessible to the whole learned world, and, supposing that the professor should be as ignorant of idiomatic English as Mr. Dole assumes, or as the ordinary translator is, they could readily be translated into English for the benefit of victims of American professors of French, and so on.

I heartily agree with Mr. Wiener that only a philological knowledge of the cognate Slavic tongues is required—that is what I meant to be understood in the beginning. But this should be thorough, not a sham derived from defective French translations instead of from the originals. The point on which I do not agree with Mr. Wiener is that which he illustrates by citing the case of Prof. Morfill at Oxford University. Prof. Morfill, despite his learning, is a brilliant example in disproof of the very point which Mr. Dole imagines that he has triumphantly scored beyond the chance of contradiction, viz., that in regard to the greater insight of an American into the peculiar difficulties which would present themselves to an American student, but not to a Russian professor, since the American has suffered in his own person the agonies of linguistic puzzles unperceived and unelucidated by the native Russian. Prof. Morfill's Grammar, which should, in virtue of this argument, be the most perfect in existence, is the worst. It is, perhaps, absolutely perfect for a person who already knows the language thoroughly in its finest shades, and is capable of grasping a set of Liebig's extract of rules—in short, for the person who does not need it, or as a literary monument. But for the beginner it is no more comprehensible than Chinese, though the book was written for beginners.

I will also venture to call Mr. Dole's attention to the fact that, delightful as it may be to boast—half a century later—that one has studied with a native American Longfellow

or a Lowell, Longfellows and Lowells are not very plentiful even in our rushing young country; also, that neither of them attained to the supreme fame of being thus mentioned without prefix or Christian name on account of their temporary professorships of foreign languages, but rather in despite of this, and because of their mastery over their own tongue, which less noted Americans would do well to imitate. ISABEL F. HAPGOOD.

JULY 4, 1892.

FRANCES DUNLAP LOWELL.

TO THE EDITOR OF THE NATION:

SIR: While so many tributes have been paid to our great poet, essayist, and statesman, James Russell Lowell, will you give me a little space in your columns to say something of the woman who for thirty years was the great inspirer of his life? She has been strangely overlooked in the many notices that have appeared from time to time. The writer of this has at various times been an inmate of their home and knows whereof she speaks.

Frances Dunlap Lowell: beautiful in person, attractive in manner, her loving nature drew all to her who came within her influence. She charmed little children, and young men and young women became closely attached to her. She possessed rare common sense. The practical element in her supplied what was wanting in Mr. Lowell in this respect. He gave into her keeping all his income that she so well knew how to spend to the best advantage, so that their never large income told for much more than most persons would have thought possible. But this was far from being all. She had fine literary instincts, which Mr. Lowell fully recognized. He used to submit all that he wrote during the period they lived together to her criticism, and said that he valued her opinion above every other. She hesitated not to give adverse criticism whenever she disapproved of what he wrote, or thought him not at his best. That wonderful "Commemoration Ode" he read to her page by page, as it was written, as well as the last series of the "Biglow Papers." He said to more than one person, "She has a perfectly rounded character, and is superior to any woman I have ever known."

She loved this man with all the strength of her noble nature, but in no narrow way. She was broad in her views of human life, and generous almost to a fault. Of a deeply religious nature, the Divine element within her was always uppermost and ruled all the affairs of her life. She had a genius for loving. When, seven years since, she closed her eyes to this world, the greatest light of this man went out. Had she lived to the present time, James Russell Lowell might now be living, with the prospect of ten years at least of usefulness to his country and the world before him, such loving, wise care did this woman, Frances Dunlap Lowell, take of him.

SOPHIA T. TOWNSEND.

PORTLAND, ME., July 5, 1892.

Notes.

AN illustrated subscription book, 'Famous Composers and their Works,' edited by Prof. J. K. Paine, with able collaboration, is to be published in the fall.

The Presidential year involves a new edition of McPherson's indispensable 'Handbook of Politics,' which James J. Chapman will issue at Washington a month hence. Any one who remembers the electoral and legislative events of the past two years will know what interesting data this thirteenth volume of the series must contain.

Harper & Bros. announce 'Carlyle,' by Prof. John Nichol; 'On Canada's Frontier,' by Julian Ralph, illustrated by Frederic Remington; 'The Danube: From the Black Forest to the Black Sea,' by F. D. Millet, with illustrations by the author and by Alfred Parsons; and 'That Wild Wheel,' a novel by Frances Eleanor Trollope.

Little, Brown & Co., Boston, will begin in September a new edition of Bulwer's works in forty volumes, each provided with a frontispiece designed by E. H. Garrett.

The Arena Company, Boston, have in preparation 'The Rise of the Swiss Republic,' by William D. McCrackan; and 'Sultan to Sultan: My Adventures among the Masai and other Native Tribes of East Africa,' by Mrs. French-Sheldon.

W. H. Lowdermilk & Co., Washington, have undertaken to complete Mr. Hickcox's 'Monthly Catalogue of Government Publications,' and to issue it hereafter regularly and promptly, with Mr. Hickcox for editor. We trust that the enterprise is at last on the stable footing which Congress and the libraries of the country should already have assured it. The subscription price will be five dollars a year.

Rand, McNally & Co. have in the press a translation of Paul Berkow's 'Vae Victis,' illustrated with views of the Alhambra.

The most interesting part of 'The Naturalist in the Transvaal,' by W. L. Distant (London: R. H. Porter), is that relating to the Boer, his manner of life and opinions. In the characterization of him as a mixture of the old Israelite and the Scotch Covenanter, "a rough, God-fearing, honest, homely, uneducated Philistine," whose one book is the Bible, the author differs little from other writers. But he appreciates better than Lord Randolph Churchill, for instance, the Boer's intense love for the independence which he won by hard living and hard fighting, and sympathizes with him in his bitter resentment at the invasion of his solitudes by the eager, restless throng of money-seekers attracted by the gold mines of Johannesburg. His days are numbered, however, for "with the railroad the ox-wagon will disappear, and with it the last characteristic feature of the old voortrekkers." The Kafir, who still forms the bulk of the population, is described as a fairly trustworthy laborer, whose industry is shown by the fact that he takes back every year from the farm and the town to his kraal about $3,000,000 in gold coin. The author's accounts of his various excursions to observe the bird and insect life of the Transvaal are always entertaining, the scientific description of his collection being relegated to an appendix. This fills about half the book, and is mostly the work of the leading English ornithologists and entomologists. The attractiveness of the volume is heightened by the general excellence of its illustrations, and especially of the colored plates of the more important insects collected by the author.

'France of To-day,' by M. Betham-Edwards (Lovell, Coryell & Co.), does not call for extended comment. It will be a disappointment to readers who are led to take it up by the reputation of the author. But for that reputation one would guess it to be the work of an inexperienced writer, who had no qualification for literary work, and who had read more books than she could digest. The style is slipshod and careless; there is a good deal of repetition, and a good deal of tedious and jejune commonplace, together with much irrelevant literary allusion. It contains some useful and interesting facts concerning the ordinary routine life of French peasants, the provision made by the Third Republic for popular education, more particularly for that of girls, and a few other topics which, if skilfully handled, could well furnish forth an interesting essay of perhaps fifty pages, but, when spread and padded out into a book of 335 pages, produce a most wearisome effect. Two or three specimens of the style may amuse our readers: "On the Committee of Management—a noteworthy fact—figures the name of a Protestant pastor" (p. 125). "Above the chair of office, a fact to be specially noted, hangs a crucifix" (p. 250). "The siege of Belfort gave French history as grand a page as that of La Rochelle; and, advocated by Thiers, 'the old man eloquent,' rescued the key of the eastern frontier from the fate of Strasburg and Metz" (p. 237).

Books like Mr. Charles F. King's "Picturesque Geographical Readers" (Boston: Lee & Shepard) proceed from a commendable motive, and 'The Land We Live In,' by this author, will interest most school-children. But they are but poorly adapted for reading aloud, especially for rhetorical exercises, though Mr. King has collected at the end some poetic fragments about the States. In parts the descriptions are so condensed as to run the risk of being unintelligible, even with the aid of the very good illustrations. A teacher might use the book to advantage occasionally, with amplifications.

Mélusine for May-June reproduces a curious impression from an old woodcut inferred by M. Gaidoz to be of the time of the Fronde. The legend is an Alexandrine—

"Les quatre vérités du siècle d'à présent";

and the personification consists of four figures representing a priest, a soldier, a man of law, and a peasant—a man of the people, a Populo (or Populot) as he would be called nowadays, says M. Gaidoz—"the Fourth Estate," as it is the present fashion for the orators of the working class in France to designate their constituents, though the name has long been appropriated by the Press. M. Gaidoz sees in this picture "tout un programme," the implication being that on this proletary, with fowls, game, and eggs in his basket and panier, the three orders are dependent for common nourishment.

In the *Revue Internationale de l'Enseignement* for June 15, M. Ch. V. Langlois has the happy thought to print *in extenso* the metrical "Somnium cujusdam clerici" found in MS. in the library of the city of Reims. Littré knew of it, and cited it in his 'Histoire Littéraire de la France,' but did not give it its true value. It is, in fact, a memorial of a battle between the English and Picard "nations" in the University of Paris, in 1279, arising out of some question of precedence, which ended in the expulsion of the Picards. The author of the "Somnium" was one of the expelled, and he bewails his fate in 380 rhymed verses showing a strong affection for Paris.

"Cum mallem Parisius sine mora mori
Quam hic esse spacio vivens longiori.
O dulcis Parisius, decor omnis ville,
Civitates superans omnes modis mille. . . .
Urbs nulla se audeat tibi comparare"

—he says. The luckless scholar is soundly rated in his dream by Prudence, but cheered at the end by Hope. What is noticeable is that he does not *name* his English enemies, con-

tenting himself with the allusive "gens aculeo caude nimis dure," it being a tradition that Englishmen had tails, and a customary mode of aggravating them by referring to the fact. "Anglici erubescunt caudati vocari," says Étienne de Bourbon.

A very effective beginning is made of an annual 'Studies and Notes in Philology and Literature,' published by Ginn & Co., under the direction of the Modern Language Departments of Harvard University The first volume, consisting of 128 pages, is slenderer than its successors are expected to be, but not many are likely to contain a more weighty article than Prof. George Lyman Kittredge's formidable critique of Prof. Lounsbury's advocacy for Chaucer of the authorship of the English 'Romaunt of the Rose.' It occupies just one-half the volume, without a particle of verbiage. Prof. Kittredge contributes, besides, a kindred paper on Henry Scogan, controverting Brandl's ascription to him of the 'Court of Love.' Prof. E. S. Sheldon discusses at length the origin of the English names of the letters, and furnishes also some etymological notes; Mr. John M. Manly traces the meaning and etymology of "lok Sounday"; and Prof. Kuno Francke, with the aid of plates, makes a very plausible argument to show that Mantegna's "Triumph of Cæsar," which hung in one of Goethe's drawing-rooms for daily contemplation, was the source of several images in the Mummenschanz procession of Plutus-Faust in the Second Part of "Faust."

The interesting exercises at the opening of the new Library building at Cornell University last October have been printed in a fine quarto pamphlet, illustrated in a way to give a good idea of the beauty and aptness of the structure, which seems ideally well placed (on a hillside) for indefinite enlargement of its stack room. Portraits of Mr. Henry W. Sage, who generously bore the cost of erection; of ex-President White, who bestowed his remarkable historical collection upon the Library; and of Mrs. Jennie McGraw-Fiske, after Miss Whitney's medallion, are likewise inserted.

A three-quarters portrait of the late James R. Osgood leads the series of plates in the July *Sun and Shade* (N. Y. Photo-Gravure Co.). The rest present the customary assortment of views from nature and copies of paintings, and are of good average quality.

—The New England Society of Orange, N. J., has fitly undertaken the publication of the late Dr. Stephen Wickes's posthumous 'History of the Oranges.' Newark, of which these pleasant suburbs of New York once formed part and may again, was a New England settlement, and was the last experiment in theocratic government on this continent. It was founded *anno mirabili* 1666, with a covenant which confined the right of suffrage and of office-holding to members of Congregational churches. In the course of fifteen years this "Fundamental Agreement" was already laid on the shelf; by the end of half a century the Congregational polity had been superseded by the Presbyterian. Apart from its share in these transformations, the history of Orange has few salient or picturesque features, and the interest of Dr. Wickes's cautious researches is almost wholly local. Of all the town's primitive industries, that of hatting has been the most persistent and profitable, while the manufacture of shoes has gone under, partly as a consequence of the civil war, for coarse cowhide shoes for slaves were a specialty, and one saw them carted to New York in "a wagon with sideboards, and heaped up five or more feet high, like a load of hay." Copper-mining is also extinct, though the deposits were not exhausted. The ore had to be shipped abroad for smelting, and the jealousy of the protectionists of the mother country was likewise shown in the case of iron, an act of 1750 forbidding the erecting "of any mill or other engine for slitting or rolling iron, or any plating forge to work with a tilt hammer, or any furnace for making steel," in any of the colonies. The advance in the hat-making trade, too, was deemed "to the prejudices of Great Britain." The history of Orange in the period under review (1666-1806) is bound up with that of its First Church (the Mountain Society, as it was originally styled). The parish sloop for the support of the Gospel was an odd investment, growing out of dock privileges on the Passaic River. She plied between Newark and New York. The subscription paper for the purchase of her, in 1784, here given in facsimile, contains the first mention of the town's name extant in any local record; and this name was adopted for the sloop. The pastors were men of mark and spirit, and samples of their sermons curiously reflect the spiritual habit of the time. In 1784, Pastor Chapman helped the neighboring church at Caldwell into existence, and its first two ministers (1788-1833, 1834-1840) were Stephen Grover and Richard F. Cleveland, the namesake and father of the ex-President. Orange was represented in Congress for thirty years in succession, in House and Senate, by Dr. John Condit. Dr. Wickes's chapters were not fully wrought out before he died, but they have been edited with intelligence, and the book is solidly and handsomely made and profusely illustrated.

—The ninth volume of the new edition of 'Chambers's Encyclopædia' (J. B. Lippincott Co.) contains some first-rate specimens of the kind of writing demanded by works of this character. Such are—opinions apart—the articles on Rousseau, by the Rev. H. G. Graham; on Russia, by Prince Kropotkine; on George Sand, by George Saintsbury; on Shakspere and Shelley, by Prof. Dowden. Mr. Lang is the brief biographer of Sir Walter Scott, with a lavish hand. The Salvation Army is described by Bramwell Booth, with a lack of realism that was to be expected. The venerable Isaac Pitman cannot be charged with egotism in mentioning himself and his system in the article on Shorthand, but Mr. Theodore Watts, who treats of the Sonnet, certainly goes out of his way to advertise his four exemplary "sonnets on the sonnet," "one only of which, under the name of 'The Sonnet's Voice,' originally printed in the *Athenæum*, was widely circulated in sonnet anthologies." Mr. Alfred Russel Wallace defines and defends Spiritualism, with little astuteness, and, in the case of this country, with absurd praise of the intellectual performances of "seers" whose moral status, too, in the community has suffered a woful decline, though Mr. Wallace appears to be ignorant of it. The appalling fact of the worthlessness, literary and practical, of the great mass of spirit communications, is not so much as hinted at. Nor does Mr. Wallace, in attempting to deduce from the "long and eloquent addresses" (signifying nothing) of trance mediums "our most complete knowledge of the teaching and philosophy of modern spiritualism," remark on the absence, after more than forty years of assumed intercourse between the two spheres, of any consistent, definite, detailed account of the next life, such as, if the spirits were to put the questions, would be given to them of life on the earth—such as we obtain from travellers concerning foreign countries, or such as we should exact of the explorer of Symmes's Hole concerning its subterranean inhabitants. These astonishing defects in the revelation, though they do not settle the question of the genuineness of the mysterious phenomena which constitute the alphabet of spiritualism, do cast a chill on the pursuit of the subject by existing methods.

—The first four out of the sixteen parts of the new annual supplement to 'Meyer's Konversations-Lexikon' come to us from Westermann & Co., and furnish fresh proofs of the value of this publication. The leading geographical articles record the progress of exploration in Africa (filling five pages), Asia, Australia; and under the Dark Continent we have a table of the extraordinary development of European appropriation of territory in the past fifteen years. Under Australia is sketched the basis of the proposed Confederation. Under China it is manifested how much prompter the Government was to avail itself of the telegraphic bond of national union than of railroads, of which the strategic value may yet appear to the Peking dynasty. The article on Bosnia tells of the fostering, by the Austrian Museum of Art and Industry, of a revival of the Oriental hand industry of damaskeening, with happy effects on the trade of the province, and without injury to the native taste; a like movement in the manufacture of woollen hangings and tapestry has sprung up. Noticeable are the statistics of the Prussian income tax and railroad system, together with the censuses of Berlin and Germany. The Chadourne incident is related under Bulgaria. There is a long article on the history of Cambridge (Eng.) University. Under Banks there is a survey of the development of the chief banks of Europe, with such comparisons as the United States afford. The several scientific and learned congresses of the year are reported, as usual; a long chapter is devoted to the legislation in several countries looking to the insurance of workingmen. Electricity is another prominent rubric. The obituaries include two real Bonapartes and two Brummagem—Boulanger and Balmaceda; on the other hand, the new men taken cognizance of are J. M. Barrie, T. Hall Caine, and, tardily, Aubrey De Vere; with Mr. Elkins, our present Secretary of War. It affords some idea of the scope of this work to cite the article on the discovery of Aristotle's 'Constitution of Athens,' and the news item, which will strike the eye of readers of Tolstoi's 'War and Peace,' that the One Hundred and Fourth Ustiug Regiment in Russia has been named after General Bragation. The maps and illustrations have the customary originality and worth: a map of illegitimacy in France, Germany, Austria, Hungary, and Italy; one of the lighthouses on the German coast; and views of mountain railroads, with diagrams of mechanism and a profile of the highest in the world—that on Mt. Washington being overlooked.

—In the *Revue des Deux Mondes* for June 15, M. Alfred Binet prints an interesting article on Jacques Inaudi, the latest arithmetical prodigy, whose case has recently been investigated and reported on by a committee of the French Academy. Jacques Inaudi is in his twenty-fifth year, and comes of a poor family; his earliest years were spent in minding sheep. It was at the age of six that he first showed an interest in figures. Unlike most celebrated calculators, he did not employ pebbles or his fingers, or other visible symbols, to perform his sums: his operations were mental, and

done by means of words—that is, by the names of the numbers from one to one hundred, which his brother recited to him. Neither he nor his brother could read at that time, and, as far as he recollects, his brother did not teach him the multiplication-table. With the numbers he knew he proceeded to calculate, and when he had exhausted them, he asked to be taught the numbers exceeding one hundred. Thanks to continued practice and to his prodigious aptitude, his progress was rapid. At the age of seven, he says, he could multiply five figures in his head. He soon left his native land to go on a tour with his brother, who played a barrel-organ while Jacques picked up the pennies and gave occasional specimens of his proficiency in figures. Presently he was taken in hand by a showman, and made his first appearance in Paris in 1880, being presented to the Society of Anthropology by Broca, who made him the subject of a brief note, from which it appears that at the age of thirteen Jacques was still innocent of reading and writing. He has acquired those arts since, and has in other respects made great headway, although his education has remained rudimentary on many points. The operations which he performs are addition, subtraction, multiplication, division, the extraction of roots; and he resolves, by arithmetic, equations of the first degree—all in his head, without any outward aid from reading or writing. A problem is given to him, *viva voce*, he listens attentively, repeats it distinctly, says, "I begin," starts muttering to himself very rapidly, and goes on calculating, undisturbed by anything that goes on about him. He can answer questions, and even carry on a conversation, while performing his mental process. After a very short interval he says, "I have done," and gives the solution, proving it, also, for his own satisfaction. The problems he solves are such as multiplying by each other numbers composed of eight or ten figures, or he will say how many seconds there are in an arbitrarily chosen number of years, months, days, and hours, or he will add in a few seconds seven numbers, each composed of eight or ten figures; he will rapidly find the square or cube root of a number containing twelve figures; he can extract as well the sixth or the seventh root.

—M. Binet's discussion of the facts just enumerated, and of others for which there is no room here, leads him to the conclusion that the case of Inaudi furnishes a remarkable confirmation of the modern theory of partial memories—the theory, namely, that there is a musical memory, a memory for language, for letters, for numbers, etc. All arithmetical prodigies have an unusual memory for numbers, while their memory for other things is not above, and is perhaps below, the average. Inaudi can repeat twenty-four figures that have been recited to him, while the average man can repeat only from seven to ten; but when it comes to letters, Inaudi cannot repeat more than seven or eight. A second conclusion is the discovery of an auditive as well as a visualising memory; that is, while all other mathematical prodigies who have been able to give an intelligent account of their mental processes have agreed in saying that they saw before their mind's eye the figures with which they operated, as a blindfolded chessplayer sees the squares of a mental chessboard, Inaudi, on the other hand, distinctly asserts that he does not see the numbers, but that he hears them resound in his ears with the pitch of his own voice. His habit of whispering to himself while calculating confirms this account, and a further confirmation is found in the fact that when he tries to stop whispering, his operations take much longer than the usual time.

VON HOLST'S UNITED STATES.

The Constitutional and Political History of the United States. By Dr. H. von Holst, Professor at the University of Freiburg. Translated from the German by John J. Lalor. 1859-1861: Harper's Ferry—Lincoln's Inauguration. Chicago: Callaghan & Co. 8vo, pp. 459.

With this volume Dr. von Holst announces the close of his important work. In a letter to Von Sybel inserted as a preface, he gives his reason for making the inauguration of Lincoln instead of the attack upon Fort Sumter "the end of the old Union and the beginning of the new," and therefore the proper end, also, of the history of the old Constitution. The question is not one of much moment. Several striking events might any one of them be a fit end of an historical epoch. The election of Lincoln in November, 1860, and the immediate overt act of South Carolina beginning the secession programme, was in several ways more significant than Lincoln's inauguration.

Americans who assert that the Union was not destroyed—that the attempt to destroy it, gigantic as it was, proved unsuccessful—will naturally prefer to ignore any sharply drawn distinctions between the old Union and the new. In a strict sense, the constitutional history of the epoch of slavery ends with the adoption of the constitutional amendment abolishing slavery. The Union remained, but the Constitution was amended in harmony with its own provisions to that end, fundamental as the amendment was. The effect of the Rebellion in hastening the constitutional change was very great; but the sharp arbitrament of war must be regarded as compelling the acceptance of a result foreshadowed in the election of Lincoln. Had there been no rebellion, three steps would have been taken in a peaceful evolution of our organic system. First, there would have come a practical acquiescence in the popular decision that no more slave States should be organized, and that all future new States must be free States. Second, the slavery system would have decayed in the remaining slave States, beginning with the borderland from Maryland to Missouri. Third, in the ripeness of time, freedom having become practically universal, the form of the Constitution would have been made to agree with the fact; the remnants of the old bondage being removed by compensated emancipation, perhaps, and this being the consideration for the anti-slavery amendment.

This was the consummation toward which the Republicans of 1860 looked. It was also the consummation which the secessionists of 1861 knew to be inevitable if they peacefully accepted the election of Lincoln. It might have taken a century, though such processes of evolution tend to accelerate. But it was not so to be. The secessionists made war, not only on the Union, but on the progress of the age. It is probable that but for the attitude of all Christendom toward slavery, the Confederacy might have got such aid and comfort as to establish it and make the disruption permanent. It found, by sorest experience, that the progress of the age was not a glittering generality, but a force potent enough to control the action of States and to limit to words the sympathies of rulers like Louis Napoleon.

Dr. von Holst continues his masterly analysis of events down to the Presidential election of 1860 with a power and success which leave little to criticise. Differences of opinion grow more marked (as he himself recognizes) when we come to the interpretation of the events of the following winter. The true purposes of Southern leaders, the real attitude of Buchanan toward them, the various groups of Northern political forces, and the development of popular sentiment in both sections—these start complicated problems of which the solution is far from clear. Their consideration opens so wide a discussion that any historian may well pause before attacking it.

We cannot help thinking that Dr. von Holst has felt the difficulty of going further, and has practically closed his history with the autumn election, giving a sketch, rather than full treatment, to the problems suggested. In what he has written, he leans to a more simple analysis of the political elements and forces than his American readers will be apt to receive. In such a crisis, the formal organizations of parties by no means constitute the nation. It was a time when parties were not unlikely to be blown out of existence by a whirlwind of popular feeling. Political leaders and organs are, in such a time, the most vacillating and uncertain of things. Their utterances are hollow, and have no fixed relation to their real beliefs. They are either whistling to keep their courage up, or are prophesying smooth things to the circle of their closest followers. To declare that that will happen which they wish to happen, and to scout all dangers which they dread, is of the nature of nominal representatives of vested political interests in a revolutionary time.

To quote party newspapers and speeches of politicians is, therefore, only to note the things which they wished and apprehended. It leaves unsounded the depths of the popular current which is sweeping all onward. It does not even measure the true opinions of those who are quoted, whose voices often sounded sepulchrally hollow to themselves, while they expressed unshaken confidence in the good fortune of their party and their friends. Von Holst does not seem to recognize this sufficiently in his chapters on the "Wrong Calculations of the Republicans" and the "Wrong Calculations of the Secessionists," in the fateful winter before the war. We should put more stress on the fact that each party was formed of many groups, not only, but that on the outskirts of each were many of whom it was doubtful whether the centripetal or the centrifugal force were stronger upon them. The slightest thing might change attraction into repulsion. To hold the elements together, to draw on the doubtful, to hold back the too aggressive, to watch the drift of sentiment, to suppress imprudent disclosures, to seek forms of commonplace accepted by all—these are the time-honored arts of political managers which are practised till the very down-pour of the deluge which had been the proverbial limit of their planning.

Von Holst's treatment of this period seems to deal too much with the outward expressions of prominent men and journals, and not to reckon enough with the forces behind them. It may not be possible, even now, for one to the manner born to marshal properly the evidence which shows the true spirit of that time in the North or in the South. With all his industry and all his instinct for historical investigation, it is doing no discredit to Dr. von Holst to say that it was impossible that he should adequately examine the infinite forces

working beneath the surface and leaving obscure traces of their action, but which accumulated a power to sweep away vociferous leaders and give the lie to their prophecies and their expositions. An equally able investigator, living in America, might give to the inner history of that winter of 1860-61 the full twenty years which the distinguished German professor has devoted to his whole task, and find the time none too long.

We believe it will be found that in the North and in the South there was a development so rapid that the most truthful history of the time would be one showing from week to week such changes of sentiment and opinion that an estimate of the purposes of men which would be accurate for November would be false in January, and one which would be true for the 4th of March would be absurd for the 13th of April. A consciousness of this (more or less adequate) made sagacious men like Lincoln adopt a waiting policy. *Laissez-faire* became a respectable principle instead of being a helpless makeshift. It was the germinating time of a revolution, and the changes which wrought beyond expectation did not prove "wrong calculations" in any proper sense, on one side or the other. The conflicting expressions of men showed rather that they took refuge in formulas of hope or of courage because they were impotent or afraid to speak out their inmost hearts, and were waiting for a demonstration of forces before which they stood in awe. With such a view of that time, it becomes to us an epoch in itself, and we can sympathize with the feeling of the historian that it had better be left to a separate treatment. It is too large a theme for the closing chapters of a great work devoted to seventy years of previous constitutional development.

Down to the beginning of the second session of the Thirty-sixth Congress, Von Holst's history has the very great merit of grasping with firm hand the clues to American development found in the conflict between slavery and freedom, and of showing clearly the control this antagonism exerted upon both the exterior and interior policy of the country and of the parties which ruled it. Through all his seven volumes there is a unity of thought and a strength of handling which we cannot fail to acknowledge, even when we find ourselves occasionally differing from his estimate of men and of measures. It makes the reader feel how inevitably the woes of the great conflict of 1861 were potentially hidden in the wrong of slavery which all the colonies shared, but which, by a fatal error, was allowed to survive the establishment of a republican constitution in 1789. In this respect the book has hardly a rival, and it must long remain a leading authority in both hemispheres.

In noticing former volumes we have had occasion to express regret that the English version was not more satisfactory. The last volume gives less occasion for criticism in this respect than some of its predecessors, though there are many involved and complex sentences that might easily have been put in a form to be much easier and more attractive reading to the American public. The book is so able and so honest, and it teaches lessons which our people may profit so much by learning, that we could wish its form were every way such as to attract the widest possible circle of readers. It is also to be hoped that an index will be furnished for the whole work, there being as yet none at all.

RECENT FICTION.

A Human Document. By W. H. Mallock. Cassell Publishing Co.

The Quality of Mercy. By W. D. Howells. Harper & Bros.

Fifty Pounds for a Wife. By A. L. Glyn. Henry Holt & Co.

Vesty of the Basins. By S. P. McLean Greene. Harper & Bros.

A Daughter of the South. By Mrs. Burton Harrison. Cassell Publishing Co.

An Edelweiss of the Sierras, and Other Stories. By Mrs. Burton Harrison. Harper & Bros.

Colonel Starbottle's Client, and Some Other People. By Bret Harte. Boston: Houghton, Mifflin & Co.

Tales of a Time and Place. By Grace King. Harper & Bros.

Don Finimondone: Calabrian Sketches. By Elizabeth Cavazza. Charles L. Webster & Co.

In the introduction to 'A Human Document,' Mr. Mallock informs us that his part in the work is little more than that of a compiler of letters and diaries, and that the novel is therefore a chapter from the life of two people faithfully written by themselves. The only reason for questioning the truth of this statement is the lengthy exculpatory discourse which follows it. In the past the author has involved himself in immoralities without any prefatory defence, and here he has the sane and chastened air of one conscious of follies committed, who wishes to say, "I am going to do it again, but accept beforehand my rational extenuation." His defence is a protest against those limitations in depicting life prescribed for English novelists by English public opinion. These limitations have furnished a theme for many rebellious essays which frequently impress the disinterested as more or less shameless pleas for the unreserved privilege of writing indecent novels. Though we may suspect Mr. Mallock of having the same end in view, his argument is so clear, temperate, and civil that it goes far to disarm the suspicion; indeed, when considered apart from the novel which it prefaces, it is an admirably concise and comprehensive declaration of the principles by which all fiction should be inspired if it would have any enduring value as a picture of life or a guide for living. Considered in its relation to 'A Human Document,' it is an adroit stratagem for heading off alert censors of morals, who, with such frank preparation for a violent shock, will be so worn out by hope deferred that when the critical moment arrives, they can experience only a passing tremor.

Never was an immoral situation arrived at more decorously or with such deliberate elegance. Every person concerned in the action is a personage, and we see the common sinners, Mr. Grenville and Mrs. Schilizzi, strolling down an endless perspective of Hungarian castles till plebeian eyes are dazzled, and plebeian judgment hesitates to express itself confidently about the commonness of their sin. The only way to recover a decent self-esteem is to declare ourselves bored by the description of their external life, and to wonder why, of all the objections to the book foreseen and apologized for, its dulness should have escaped the author's observation. The diaries in which Grenville and Mrs. Schilizzi disclose their intellectual and emotional progress from indifference to mutual passion, with subsequent relapses to coldness and accessions of fervor, are unquestionably human documents, in their assumption that nothing could be so important or so impressive as even the trivial acts and thoughts of the writer. So much earnest sincerity applied to self-scrutiny may be salutary to the scrutinizer, but the solemn egotism of the performance is the quality most clearly visible to the reader of the record; it is also the quality in the Grenville-Schilizzi memoirs which substantiates the author's claim for them as an impartial revelation of the contact and conflict of good and evil in the persons implicated. The genuine humanness of the documents is further attested by their unconscious revelations. Grenville never mentions that he is either a prig or a snob, yet his confessions fairly entitle him to both attributes. Mrs. Schilizzi never refers to her desire, growing into an intention, both to eat her cake and have it too—a vulgar determination of all women whose private lives run counter to the demands of their public, conventional respectability. Yet she is neither vulgar nor immoral, only lacking in that rare mental integrity which compels one to face an unpleasant fact. Her unfortunate circumstances abundantly explain an infidelity which brings in its train many forces for the disintegration of character. A victim to the barbarous custom which permits, and in lofty circles encourages, the marriage of a young girl to a man whom, if she knew him at all, she would loathe, is generally faithful to that husband just so long as she escapes close contact with a man who seems to give her all the understanding and sympathy which she has longed for and hitherto missed. Schilizzi's total depravity makes his wife appear an angel of patient forbearance. He is in every aspect so loathsome that the services rendered to him by Grenville when he lies dying of diphtheria are unnatural, unnecessary, and revolting. The only chapter in the book for which apology is needed (that which the author may all the time have had in mind) is the one describing the progress of Schilizzi's malady. This is a plunge into the mire of naturalism from which, if public opinion could for ever restrain our English novelists, we need not regard the name of "prude" as a reproach.

'The Quality of Mercy' is a modern novel, yet not precisely up to date, for its events precede the ratification of the extradition treaty between the United States and Canada. Long familiarity has made the public callous to any sad significance in the announcement that a highly esteemed citizen, long occupying a position of trust, has mysteriously vanished; that an examination of his books discloses peculations extending over a quarter of a century; that a distracted family has locked the front door of his palatial mansion whereat the righteous interviewer batters in vain. The amount of the respected citizen's embezzlement must be enormous to excite more than a passing breath of comment. The student of character alone maintains a vivid interest in the fact, undiminished by its frequency. To him the absconding gentleman perpetually suggests the questions, whether during his career of crime he has ever regarded himself as a thief; whether the suspicion is forced upon him only by the moment of discovery; whether, even after that, he can cast aside the garment of self-delusion and see his soul's deformity. Mr. Howells presents

these questions concretely in the person of Mr. Northwick, the defaulting treasurer of the Ponkwasset Mills. The circumstances are precisely similar to those so often narrated in the newspaper reports of a defalcation. The clever youth of a country village goes up to town (in this case Boston), seeking a sphere of action commensurate with his abilities. Energy, industry, boldness held in leash by prudence, known domestic virtue, all combine for the speedy achievement of prosperity. His children reap the benefits of his wealth and his high repute. As he approaches old age, apparently in indisputable possession of the honors that should attend it, the awful moment arrives. The Ponkwasset Company fails to meet its engagements. The horror-stricken directors meet in hasty conclave. It is plain that their childlike trust has been abused, and they, the innocent, the unsuspecting, stand discredited unless a scapegoat be speedily produced. He is just at hand, and it is at the crisis when monumental respectability topples and crashes in the dust that Mr. Howells's study begins. His presentation of a character so complex and inscrutable is profound and complete, the artist's intuition supplying many links in the chain that can never be found by the mere observer, however keen. Northwick seems to be a type of men of his kind as true to life as are Silas Lapham and Bartley Hubbard. The pleasure to be derived from reading this study is a purely literary one, and, great as that is, it cannot dispel the depression caused by the subject's intrinsic pain.

The author has, however, done his best to lighten inseparable gloom. Noticeably inspiriting is Pinney, the reporter, genial, light-hearted, and kind in almost every relation of life, yet a perfectly unscrupulous little fiend when animated by a desire to make a "beat" in the interest of *The Events*. If the day shall ever come when the Pinneys cease from troubling, they will still remain alive and terrible in the pages of Mr. Howells's novels. The perusal of 'The Quality of Mercy' must increase the admiration of the author's constant readers for the fidelity with which he has pursued his chosen way, to present a series of pictures of common American life. They must also be impressed by that steady advance in knowledge which is helping him in his later works to represent his people as, after all, more human than American. The hardness and coldness of his touch, which resulted from limited vision, have been much modified. Without loss of brilliancy, his style has gained urbanity, even tenderness, and thus compels a personal affection through which intellectual admiration suffers no detraction.

The summer is with us, and it is not the joys of the season which are increased for the reviewer by the summer novelist. If it were imperative that the novelist should express or suggest ideas, however feeble, there would be no summer novels. If there is one thing to which the summer intellect is not attuned, it is the reception of ideas, and the novelist who should attempt to inflict them would be promptly rejected with deserved contumely. With a clear understanding, therefore, of the relation between the producer and his public, the reviewer is in honor bound to award praise in direct proportion to the absence of everything that implies or demands an exercise of the reflective faculties. Judged by this standard, 'Fifty Pounds for a Wife' is easily *hors concours*. It appeared slightly before its proper time, but has nevertheless the full flavor of a luscious maturity. It has absorbed the juice and pulp (a summer novel has no blood or bones) of a hundred of its kind. It calls to mind the punctual and greedy boarder who deliberately transfers all the tender bits to his own plate; also, the confident professional gentleman who, having "gone in on his luck," proceeds to "scoop the pot." Mysteries, hereditary curses, abductions, murders, confusion of real and supposed fathers, worse confounded by real and supposed mothers—all these properties of the craft have been seized by the author and worked into the history of a lovely maiden and a demon Earl. The lovely maiden is throughout a victim, responsible for nothing but her loveliness, which she perfectly lives up to. The demon Earl is a compendium of crime, and, if we could believe in him for an instant, we should deeply despond for the race that produced him. But the author's great triumph as a summer novelist is that he is nothing if not incredible, and therefore his work makes no more demand on the emotions than on the intelligence.

A similar tribute is in justice due to 'Vesty of the Basins.' The summer boarder on the Maine coast who carries along a copy of this externally very attractive book will have an opportunity to realize how far past believing an author can get even when filled with the intention literally to transcribe life. The linguistic feats of the hoary cap'ns who guard the wooden piers of their native shores are certainly wonderful, but a wide acquaintance with them fails to locate the unpronounceable speech of Captains Leezur, Kobbe, and their associates. Their peculiarities of character suffer parallel distortion to such a degree that they are recognizable only by a pervading odor of fish and tar. The caricature of a respectable model is coarse and strained, but the author has not again put her publisher in peril of suit for libel. There lives no captain so devoid of self-esteem as to imagine himself the original of any one of the grotesque creatures collectively and with prudent vagueness denominated "The Basins."

Mr. Hale's contribution to the season's fiction is too pointedly didactic to win commendation. In small compass he undertakes to expose the rascality of the "railroad wrecker," to reprove the disseminators of idle gossip, and to accentuate the moral value of societies formed by women for the suppression of self-recognized faults and the extension of good works. Compelled to carry so much serious motive, the interest of the story is divided, only to be united by the momentary fear that the great gossip of Atherton has parted for ever the widow Knox and her devoted swain, John Coudert. Coudert's character has no surprises: he is always worthy and persistent in the several missions undertaken for love of Mrs. Knox, though they involve him in considerable trouble and expense. In the development of Mrs. Knox we confess to some disappointment. A good deal is expected of a lady sufficiently unconventional, not to say excitable, to drive down Fifth Avenue (a thoroughfare where cabs abound) on an express wagon, whip in hand. We feel that such a spirited person ought to have promptly attacked and suppressed the village gossips, and that she would not have lost her pristine vigor amidst the languid joys of Atherton picnics, or at once succumbed to the chastening influence of a "Send Me" society.

The literary references which plentifully grace the story of 'A Fellowe and His Wife' will slightly mar the enjoyment of the casual reader. He will take it up on the train or steamer, far removed from kindly books of reference, and will immediately become depressed by a sense of his ignorance concerning the private lives of great poets and the comparative merits of the great guns of several literatures. If he be conscienceless about those things, his idle hour will be pleasantly filled. The letters exchanged between the Count and Countess von Jaromar move emotion without harrowing it, and comedy is ever more present than tragedy. It is evident from the beginning that the Countess is a light-minded young woman, and that her real motive for separating herself from her obliging husband is a desire to see life, for which purpose the expressed yearning "to feel that I, a woman, am not a mere appendage," forms as good an excuse as any other. Her gift of self-deception is considerable, but her taste for bad company is so much more pronounced than that for art that we suspect Mr. Sharp of a gentle satire on so serious a movement as the emancipation of woman. Miss Howard's Count is a very good "fellowe," a little prosy, a little sentimental, yet blessed with that tact which alone, in his situation, could save him from appearing ridiculous.

Mrs. Harrison comes bravely forward with two volumes containing fourteen short stories or sketches. Some of these invite somnolence, all are superficial and absolutely unprovocative of agitation. It is a matter for regret that the author has done nothing better than 'Golden Rod,' which, after about ten years of existence, remains an agreeable and truthful picture of the summer colony at Mt. Desert; on the other hand, we may rejoice that she has not fallen far below herself, and that she does not strive to achieve popularity by vulgarity in incident, character, or language.

None of the stories included under the title 'Colonel Starbottle's Client' are worthy of the author's fame, yet each is, in some way, better than the best of the average story-writer. Facility in composition and perfect familiarity with scenes permanently picturesque go far to enable a man to turn out readable stories by the score. Excepting the last, these stories are readable and not too grievously disappointing; but in the "Ghosts of Stukely Castle" there is a flatness which we had not supposed could be achieved by any one who had ever risen above hopeless mediocrity.

The scene of Miss King's 'Tales of a Time and Place' is always in the far South, and many of the people are not black, yet not quite white, not quite French, yet definitely not American. Something of the grace and splendor of the old régime pervades Miss King's descriptions of Creole society, and, through all adversity, her great dames remain refined, courteous, and exquisitely natural. To investigate the truth of such charming portraits would be to risk the destruction of a faith most consolatory in a world from which the great dame seems to have vanished. Far better to enjoy unquestioning what Miss King describes with at least the appearance of scrupulous veracity. In narrating a slight episode, as in sketching a simple character, her touch is at once strong and delicate, but her power of invention fails to sustain a complicated plot. She dashes spasmodically from incident to incident, and though she always has her end in view, arrives at it through much incoherence. "Madrilène, or the Festival of the Dead," is the most powerful story in this volume. The wretched girl expresses an agony of despair which can be portrayed only by writers endowed with rare imaginative faculty.

The right to live for many seasons belongs to the little volume of Calabrian sketches en-

titled 'Don Finimondone.' Here are perfect sympathy with very humble people, humor without exaggeration, and just that touch of pathos which is inseparable from poverty accepted as a condition imposed by God. The nationality of the characters is very delicately yet distinctly accentuated, not by eccentric distortions of English idiom, but by that wealth of mordant irony and philosophical aphorism which is the legacy of history to the common tongue of the Latin races.

The Province of Expression: A search for principles underlying adequate methods of developing Dramatic and Oratoric Delivery. By S. S. Curry, Ph. D., Dean, School of Expression; Instructor of Elocution, Harvard College, etc. Boston: School of Expression. 1891.

THE name Elocution, which, even with our own early writers, was nearly equivalent to eloquence, having been subsequently transferred to the subsidiary art of delivery, is at last degraded by Dr. Curry to designate an offensive display of technique without soul or real art. This leaves him no better word than "expression" by which to designate the art usually termed elocution. In this essay, which it is certainly not too much to call thoughtful and refined, although it might be found disappointing to a reader who were to expect the profound philosophy to which the adepts of this art nowadays make pretensions, four different schools of delivery are recognized as traditional—the imitative, the mechanical (that of Rush), the impulsive, and the speculative (that of Delsarte). These are all more or less criticised, although not always with entirely convincing arguments. Especially Rush's method is condemned, partly on the ground that it is mainly based upon observations, not of a natural and universal style of expression, but only of a conventional and peculiar style—an allegation far too lightly supported—and partly on the ground that the mechanical application of its rules is found to produce results very odious. But there is a confusion here between the question of the truth and utility of the rules and of the value of a stupid, unrefined, and tasteless application of them. Elocution, in this, may be compared to the art of writing, the usual rules for which are universally acknowledged as sound, so that they cannot be violated with impunity. But let them be applied with never so much technical skill, yet in a soulless, perfunctory, and undiscriminating manner, and the result will be called an academical or rhetorical style. Precisely the same effect is too often produced by elocutionists of the school of Rush. But in the one case, as in the other, it is not the rules that are at fault, but the inartistic use of them.

Nor is it fair to expect that an elocutionist should be a great artist or orator; Mr. Mackaye himself, to whom Dr. Curry seems to assign a preëminent position among teachers, is not that. The truth is, that the attitude of mind in studying principles is so opposed to its attitude in applying them, that excessive devotion to the theory of any art is somewhat unfavorable to its practice. It is so in some measure even in that principal art to which rhetoric and elocution—if not, indeed, all other arts—are subsidiary, namely, the art of thinking and of feeling aright. And the more an art is of a subsidiary character, the more theory and practice are, or seem to be, at war.

When we inquire what Dr. Curry would propose in place of the four rejected methods, we do not find a very definite reply in this volume. He insists strongly upon training, but that is a matter of course; the whole question is what the method of the training shall be. He thinks it highly important to say that the art of delivery shall be made chiefly a manifestative, and only in small degree a representative, art. But this again seems to be too far back among first principles to escape vagueness. We are promised, however, nine succeeding volumes by Dr. Curry upon his art, so that we cannot expect that the first should contain anything more than generalities.

From Palm to Glacier. With an interlude. Brazil, Bermuda, and Alaska. By Alice Wellington Rollins. Putnams. 1892. 8vo, pp. x, 145, illustrated.

THIS attractive volume is not an itinerary or book of travel, but rather a chronicle of impressions. The journey from New York to Rio, touching at various Antillean and Brazilian ports, introduces the author to various aspects of tropical nature, human and otherwise. The mental and sentimental response to the environment, the hopeless struggle of the New England temperament against the invading languors of the tropics, are delicately and wittily portrayed. Here and there are charming word-pictures of nooks and vistas of the southern world. In an orange grove:

"Already the air is full of snowy perfume; it is just as we had heard it described, with the rich blossoms, the subtle fragrance, the green fruit, and the ripened golden globes, all on the same tree at once. But what we had never heard of was the delicate carpet under foot, of the white petals falling, falling, falling—I had almost said musically falling—in a constant, silent, soft, and snowy shower. There is nothing sad in the falling blossoms; there is not the slightest breeze that could seem to insist on their taking flight, and there is nothing to suggest decay. They seem to have detached themselves of their own accord, and to float willingly down in the rich gold sunshine, as if they had simply blossomed as long as they cared to."

After an "interlude" at Bermuda, Alaska was visited. In Taku Inlet, in front of the great glacier:

"We see the great icebergs cloven from the side of the mountain glacier without any apparent agency. The air is as still as if it were sultry. There is no wind or storm or lightning to crush and mar. The sun is brilliant, but not hot enough to melt a glacier. There is no enemy in sight with gigantic axe or subtle spear. Yet suddenly there is a sound like the booming of cannon, or a long reverberation like magnificent thunder; the ice is cracking; suddenly a thin slice cut from the great mass as smoothly as a slice of bread from a loaf, by some unseen sword of Damocles in the subtle forces of the air, loosens its hold and slips slowly down into water at its base 800 feet deep. It does not crumble and topple awkwardly over as rock would; it simply separates from the rest and slides smoothly, quietly, down, down. There is an instant's pause, then a rising fountain of displaced water like a great geyser, and a little later the great mass rises to the surface, and, broken into grottos and crumbs, goes sailing down the bay to greet other ships. . . . Sometimes a great snowy mass, arched at the prow and stern, and gleaming with golden sunshine, glides slowly past like Elaine's barge floating to Camelot; sometimes one arches over like a great-lipped shell, tinged with the deepest yet clearest rose color; sometimes they are hollowed out like great grottos, full of emerald light; and again they are like tiny mountains of transparent snow, filled with superb tints of blue."

Typography, paper, and binding are all choice, but the "process" illustrations are hardly fine enough to avoid a certain air of cheapness, the only jarring "motive" in the book.

The Dog in Health and in Disease, including his origin, history, varieties, breeding, education, and general management in health, and his treatment in disease. By Wesley Mills, M.A., M.D., D.V.S., etc. New York: D. Appleton & Co. 1892. 8vo, pp. vii, 407, illustrated.

WHEN dogs are wounded or stricken by disease, they are usually turned over to the veterinary surgeon without inquiry as to his qualification. Dr. Mills, himself of the profession, does not believe a knowledge of the horse and of horse medicine sufficient. He advocates special studies of the diseases of the dog, of the effects of the drugs, and, as a necessary preliminary to an understanding of abnormal conditions, a thorough acquaintance with the animal in health. His book, a consequence of his intense interest in cynology, is a comprehensive and excellent treatise, apparently the first in its particular field. Nearly half of the volume treats of origin, classification, care, training, breeding, etc.; the remainder is filled with descriptions of the diseases, diagnoses, treatments, and medicines. On the whole, the work is well done; its recommendations are modern and humane. Its publication can hardly fail to result in improving the quality and condition of our friends the dogs, and it is suited to all who are interested in them.

Subsequent editions should correct a number of faults, grammatical or other, that have escaped the author's eye in this edition. There are thirty-nine good full-page illustrations of different races; they are scattered through the entire volume without references to their text, which again bears no references to them. To specify, the figure of the Irish wolfhound is opposite page 24, the description is on page 36; neither refers to the other, and the index omits any mention of either. The list includes only the full-page illustrations and ignores as many cuts of anatomy, effects of disease, and modes of treatment. A glossary for the technical terms is necessary. "Ears small, set well back, square, with the skull lying close to head," is due to oversight in proof-reading. Something deeper is occasionally in evidence of needed revision. The discussion of hydrophobia, p. 314, states that "the period of *incubation* or latency of the disease is more variable than in case of any malady known to us. It seems to vary between a few days (ten to fifteen) and many months, if not even years." It is added on page 318 that "as all animals bitten do not become rabid, it is not necessary to kill a dog bitten by a rabid animal at once, for he may wholly escape." Without the means of determining whether the virus is latent or incubating, it would seem, from our author's testimony, that assurance of safety lies only in immediately killing any dog that is bitten.

La Jeunesse de La Fayette, 1757-1792. Par A. Bardoux. Paris: C. Lévy; New York: F. W. Christern. 1892. 8vo, pp. xii, 409.

THIS volume, treating of the life of Lafayette up to the time of his flight from France, is to be followed by a second, devoted to his subsequent career. It is giving the term "youth" rather an extended signification to make it include the thirty-fifth year of a man who was married at seventeen and a major-general at nineteen. At an age when most men of his station have but just entered on an active life, Lafayette was already a conspicuous figure in the world's history; and although his claims to our respect may rest more on his virtues than on his talents, it must be admitted that, in spite of his extreme

youth during his service in the American Army, he committed hardly any indiscretion where it was so easy to commit so many. M. Bardoux is not always as clear in his historical exposition as could be wished, and his style does not make up for the defects of his method. Readers who are familiar with the history of the period will get but little from him that is new, while those who are not will have to go to other sources for a distinct and connected narrative of the events in which Lafayette bore a conspicuous part. But, with all his limitations, M. Bardoux gives us a very pleasing picture of the character of his hero. The reader feels that in Lafayette he makes the acquaintance of a man of noble traits and attractive qualities; one whose very mistakes were such as could spring only from the purest motives and the warmest impulses. Especially charming are the glimpses the author affords of the domestic life of Lafayette: of the devoted affection subsisting between him and his wife; of the bringing up and home surroundings of Mme. de Lafayette, who was married before she reached the age of fifteen, and who, all through her life, loyally stood by her husband in his public career, although she would have preferred for him a private station. The pages given to such topics are the most valuable in the book.

M. Bardoux may also justly claim to have cleared the memory of Lafayette of all the charges of duplicity made against him, on the one hand by the Royalists and on the other by the Jacobins. The fact that he incurred the hostility of these two parties is only to his honor, and certifies to the courage and honesty with which he opposed them both in what he believed to be the best interests of his country. If he had stooped to make terms with the extreme revolutionists, he could probably have made himself the foremost man in France. Of the substantial and disinterested services he rendered to our country it is hardly necessary to speak. The American people will never cease to appreciate them, and have permanently adopted him as one of their national heroes.

BOOKS OF THE WEEK.

Appletons' General Guide to the United States and Canada. 1892. Appletons.
Bacheller, Irving. The Master of Silence. Charles L. Webster & Co. 75 cents.

NEW YORK, THURSDAY, JULY 21, 1892.

The Week.

THE adverse vote in the House on the Stewart Free-Coinage Bill removes the greatest menace from the financial and business interests of the country, and takes the silver question out of the political campaign. In our opinion it does more. It points the way to a repeal of the present silver law—the so-called Sherman Act of 1890, which Mr. Sherman himself has declared to be fraught with dangers in the future so grave that he would be as glad to repeal it as he was reluctant to vote for it. That measure is now the only menace to the financial stability of the country. It calls for an expenditure of about $4,000,000 per month for the purchase of silver bullion that is not wanted even as security for Government notes. This $4,000,000 per month takes the place of so much gold, for if it were not bought by the Government, it would form a part of the exportable produce of the country, like any other article which has a foreign market and which lessens our foreign indebtedness. The Democratic platform demands the unconditional repeal of this act. It does not substitute any other silver legislation in place of it. The Republican party is not seriously in favor of the act, and would be glad to get rid of it if the Senators representing mining camps in the West were not so numerous and so vicious. The act was forced upon the party, very much against its will, during the struggle over the Force Bill two years ago. After the present political campaign is ended, there will be no reason why this so generally dreaded and detested act should not be repealed—both parties joining in the work.

It is stated that the Senate Committee on Finance does not intend to report, even with an adverse recommendation, any of the tariff bills passed by the House and referred to it. Doubtless the smothering process will be more convenient for certain Republican Senators. There is Mr. Allison, for example, who, on September 30, 1890, said:

> "If there is any faith to be placed in the iron and steel industry of our country; if there be anything in the promises, the prospects, the projects of these men, then it will turn out that when the 1st of July, 1892, shall come, we shall be producing in our own country tin plate to a very large extent. If the great iron and steel industry in the United States will not, now that they are to be protected in the production of tin, engage in that production, and compel the people of the United States to pay large and undiminished prices to monopolies in other countries, *then this tin duty will be swept from your statute books.*"

It must now be perfectly clear to the Senator that there was no faith to be placed in the "promises" of two years ago, and that the prices are not only "undiminished," but greatly increased; and therefore we shall expect him, as a member of the Finance Committee, to do his best to report to the Senate, and endeavor to pass, the House bill embodying his own promise to "sweep the tin duty from your statute books."

Senator Washburn's view of the produce markets, as outlined in his speech for the Anti-Option Bill on July 11, is unique and most interesting. The substance of his theory is that the system of short selling "practically eliminates from the commerce of the country the operation of the law of supply and demand." We gather from the Senator's further remarks that this state of affairs is best illustrated by the operations of one Pardridge, a noted Chicago speculator, who was reputed, a couple of months ago, to have cleared a million dollars through his persistent "hammering" of wheat prices. The incident is worth recalling. The gentleman in question spent several weeks in offering contracts to deliver grain at a future date, and he did not insist upon getting the highest prices for his contracts. His theory was that the farmers had a large supply on hand which they were about to bring to market, whereas the foreign buyers, having their storage houses already stocked up, were in no hurry to increase their holdings. It was his belief that when this grain arrived at the market it would find few buyers, and that the price, by the natural law of supply and demand —which, therefore, could not have been "eliminated" at this stage of the game—would decline heavily. When this decline should take place, he proposed to buy wheat at the lower figures and fulfil his contracts. The event proved his judgment to have been altogether correct. But if it had turned out that the farmers had no such amount of wheat ready for market (thus decreasing the supply), or that the English granaries had been unexpectedly emptied (thus increasing the demand), a child might guess what would have happened to the Chicago operator. This hardly looks as if the law of supply and demand had vanished altogether. The whole truth of the matter is that Senator Washburn and his allies make their impression on careless or simple-minded people only by instilling the belief that grain speculation is a kind of witchcraft, which begins by ignoring every commercial principle, and ends by trampling in pure deviltry on the neck of the unlucky farmer. Why such magicians should not, for mere love of change, try their hand at "long" speculation—Mr. Washburn says they have done nothing but sell for three years—it is impossible to conceive.

Senator Quay as the champion of morality and religion in this country is an impressive figure. Under his pious leadership, and yielding to the convincing Scripture texts which his daily study of the Bible enabled him to bring forward, the Senate voted on July 13 that the appropriation for the World's Fair should be made only on condition that the gates be closed on Sunday. It was ideally fitting that this hypocritical piece of legislation should have been fathered by the man whom the religious press of the country has freely denounced as a stench in the nostrils of honest men. While keyed up to such an unwonted pitch of virtue, the Senate also voted that no liquors should be sold on the grounds of the Fair. This was really sublime in men who were at the moment standing above a restaurant which their votes and patronage keep alive, and in which all kinds of liquors are on sale, a full price-list of wines being officially published. We have heard of cynical politicians "pandering to the better elements of society," but if any Senator thinks to strengthen himself politically by such open thrusting of the tongue into the cheek while posing as a severe moralist, he must be counting upon an extraordinary number of hypocrites among his constituency. The Senate had the grace next day to reconsider its action in regard to liquor, although it insisted upon the Quay code of morality by which the Exposition must be closed on Sunday. The excuse given for this absurd action was that a lot of petitions for Sunday closing had been received. But the theory of the framers of the Government was that the Senate was to be the branch of Congress which would not be driven into folly by popular clamor; that its members would be independent enough to stand up for what was right even if the majority of the people for the moment appeared to be on the other side. Of late years this theory has pretty much broken down, and it is to the House, rather than the Senate, that we now look for conservative action.

The most salient argument advanced on either side during the discussion of the Sunday-closing question was this passage from the speech by Senator Palmer of Illinois:

> "I understand that all the saloon-keepers in Chicago are in favor of closing this institution on the Sabbath day. I can understand why it should be so. The multitudes that will go to Chicago at that time, instead of going into the Fair and witnessing the Exhibition, being there alone, strangers, will go about the saloons and places of that sort on Sunday. I understand that there is a perfect agreement on that point, and that the whiskey-sellers are in favor of closing the Fair on the Sabbath."

The "combine" of the Sabbatarians and the saloon-keepers in favor of Sunday closing of the Fair is one of the most remarkable spectacles witnessed in this country for a long time. It ought to open the eyes of some of the good people who

signed the petitions that went to Congress. Sunday opening has been urged for the reason, among others, that it would give a great many workingmen and their families a chance to visit the Fair which they would not otherwise get. As nobody was especially interested to discover the attitude of this class of people toward the subject, few statistics have been collected. One canvass, however, has been made. The International Iron-Moulders' Union, whose headquarters are in Cincinnati, have taken a vote of the local unions upon the Sunday-opening question, and the result is three to one in favor, the vote standing 13,695 for and 4,585 against. This is doubtless a pretty fair test of the feeling among all intelligent workingmen.

The scandal of a President's seeking and securing a renomination by promises of Federal offices has been again illustrated in the case of the Charleston (S. C.) Postoffice. Mr. Harrison recently sent to the Senate the nomination of William D. Crum, a negro, as Postmaster, but has been forced to withdraw it in order to prevent its rejection. Of course, the whites of Charleston objected to Crum on the ground of his color, as they would do in the case of any negro, but they won their fight against him solely by reason of Crum's course in the Minneapolis Convention. He went there as a Harrison delegate, but scandalously ratted to Blaine, and finally voted for Harrison, in pursuance, as the anti-Harrison men claim, of a bargain, which was reduced to writing, by which he was to have the postmastership in exchange for his vote. Crum cut so bad a figure before the Senate Committee on Post-offices when questioned regarding the matter that the anti-Harrison Republicans were confident they could defeat the nomination in the Senate, and the President withdrew it rather than suffer this humiliation. The whole difficulty, it will be seen, arose from the fact that Mr. Harrison used the Federal patronage in Crum's case, as in so many others, to extort a renomination.

After much travail the Republican National Committee has found a Chairman in Montana, after eighteen other men had been passed in review. His name is Carter. Some people say he is a silver-man, others say he is not. But this is really of no importance, since he is not selected for his views on the money question. The Committee wanted somebody who could and would pull. Plenty of men were in sight who could pull if they would, some who would if they could; but nobody was discovered, after four or five weeks of anxious search, who was both willing and able, except Clarkson and Carter. The former was ruled out by the President as too much of a Blaine man. The latter has apparently been selected by the President, or at all events is satisfactory to him. Mr. Carter's concern over questions of finance will relate solely to the size of checks made payable to his Committee and the ways of placing them where they will do the most good, not to the abstruse matters of coinage and ratios and premium on gold. Yet he should be warned that it is a mistake for him to suppose that he can gratify curiosity as to his real views on free coinage by saying, as he did to a reporter on Sunday, "I am a Republican, and that is all I wish to say on that subject." The *Tribune* was at pains to point out, in its interpretation of the silver plank on June 17, that free-coinage men could stand on it with perfect ease.

The helplessness of the Governor of Idaho in the presence of the rioting miners comes as a new illustration of the political recklessness of the Republican party in admitting such States to the Union. The Governor, in his appeal to the President for help, declared that the entire available force of the Idaho National Guard numbered but 196 men, and as the rioters mustered several hundred, he naturally shrank from exposing the whole military force of a sovereign State to annihilation. The mining-camp Senators have debauched the Senate and made it a far more dangerous body than the House of Representatives. If now these new States are not going to be able to protect life and property in a case of domestic disturbance, they will be as much of a burden on the central Government as if they had remained Territories. But so long as the Republicans have gained eight or nine votes in the Senate, with which to save the protective system and imperil our financial stability, we suppose nobody has a right to complain.

As was to be expected, the demagogues of both parties are trying to win popularity by devising laws against the "Pinkerton men." One Congressman has already introduced a bill making it unlawful for any transportation company doing an inter-State business to transport any body of armed men except those engaged in the military service of the United States, or of a State or Territorial government. The Senate has before it a resolution directing an inquiry "whether any private corporation, company, or organization in the State of Pennsylvania, or other States, has attempted to employ force against any of the people of the said State, or of the United States, in violation of the Constitution of the United States." Curiously enough, this resolution exactly covers the case of the rioters at Homestead. They are confessedly members of an organization in the State of Pennsylvania, and openly avow that they have employed force against some of the people of that State and of the United States, and that they will do it again. As those against whom they employed force were using no force and breaking no law, it is evident that the members of the Amalgamated Association were employing force in violation of the Constitution of the United States.

On the other hand, it is very doubtful if the Pinkerton men sent to Homestead constitute a body of armed men in such a sense as would make it possible to prohibit their movements without violating the Constitution. The question would be whether they were united in carrying arms for any unlawful purpose or with any hostility to any established government. It would be impossible to show this, for the very object of their existence is to support the laws against the attacks of riotous mobs. It will be a very serious matter to enact a general law prohibiting the carrying of arms by a body of men, in the face of the express provision of the Constitution that the right of the people to keep and bear arms shall not be infringed. To devise a statute that could not be evaded would be no easy matter, as the Pinkerton men need not enter any State as a body, or carrying their arms; but it is not well to attempt legislation of this kind, even if it is known that it will not be effective, without the very gravest consideration. There is a good deal more involved in it than the issue between the Carnegie Company and its men.

Last year's grain harvest was so unequally distributed over the world that it exercised a very singular influence on the finances of the ensuing season. Not the least important of its results was the swelling of our own grain exports to Europe to an unprecedented figure, the deficiency in Europe's harvest being necessarily made good from this country's enormous surplus. Our exports of breadstuffs during the eleven months ending May 31 showed an increase of no less than $168,000,000 over the same period in 1891. Unfortunately, our farmers and financiers have to testify that this gain was not an unmixed blessing. Europe's industrial depression, arising largely from its ruined harvest, had immediate reflection in our own markets. Probably the best thing that could happen for the general welfare would be a bountiful harvest abroad this year, which would give to Europe a chance for commercial revival. Apparently this wish is to be gratified. The protracted rains of 1891 have not visited Europe's wheat fields this year, and except for Russia, where the recuperative powers of agriculture were paralyzed by the disasters of a year ago, a plentiful harvest is indicated. At the same time the forecast of our own Agricultural Bureau for July, which is usually accepted as accurate, shows that the grain harvest of the United States, though more bountiful than the average, will fall something like 500,000,000 bushels short of last year's. Altogether, this is a cause for congratulation. A repetition of last year's 612,000,000-bushel wheat harvest and 2,000,000,000-bushel corn yield would menace the

farmers with low prices and a congestion of product such as overwhelmed the cotton trade in 1891. How much we depend, even for profitable grain prices, upon industrial prosperity abroad, the closing season has forcibly taught us.

An interesting and important question, which has occasioned a good deal of conflict between the decisions of the courts of the different States, has just been passed upon by the Supreme Court of New York. A person indicted for grand larceny under the laws of this State was arrested in Wisconsin upon requisition of the Governor of New York and brought to this State for trial, but was tried for robbery instead of grand larceny, the indictment upon which the requisition was issued having been quashed. On conviction, the prisoner appealed, upon the ground that, according to a recognized principle of international law, he could not be tried for any offence other than that alleged in the requisition. The court, however, held that the relations between the States of this Union under the Constitution were different from those of two entirely independent sovereignties. The surrender of a person charged with a crime by the authorities of one country is either an act of comity on the part of the country making the surrender, or the carrying out of a treaty obligation. As the governments of the past have been as a rule despotic in character, it became necessary, in order to prevent the persecution of political offenders, to have it understood that when a fugitive was surrendered as an act of comity he should be tried for no other offence than that upon the ground of which his surrender was claimed, and this rule has been extended to the construction of extradition treaties. But, in the view of the Supreme Court of New York, extradition between the States of the Union is not governed by these rules. It is prescribed by the supreme law of the land, and is therefore not an act of comity, nor is the Constitution to be construed as a treaty. Treaties enumerate certain specific crimes, which are few in number, while the Constitution directs extradition between the States of persons charged with any crime, and it makes no difference that the offence charged is not a crime in the State from which the surrender is demanded, provided it is a crime in the State making the demand. There was a time when there were laws in the Southern States, designed to protect the institution of slavery, the infraction of which would have been regarded elsewhere as a virtuous act, and in those days there may have been some reason for restricting the right of extradition as narrowly as possible. But those days with their evils have passed away, and it is now rather to be hoped that a decision so obviously required for the enforcement of penal legislation may not be disturbed, although there is considerable authority, including, we believe, that of Judge Cooley, against it.

Immigration more than holds its own this year, the arrivals during June having been 73,120, against 68,317 in the same month last year, and 353,961 for the first half of 1892, as against 325,307 for the first half of 1891. There has been a falling off in the arrivals from every country of the United Kingdom, the whole number of Irish immigrants during the first six months of the present year being only 34,554. Germany has sent a few thousand more this year than in the same period of last year, and the Scandinavians have also been somewhat more numerous, but most of the increase in the grand total is due to the less desirable races, the Polish contingent having grown from 16,422 to 18,297, the Austrian from 17,843 to 20,127, and the Russian from 26,467 to 37,549. On the other hand, there is an ebb in the tide from Italy, the arrivals from January 1 to June 30, 1892, being only 42,090, against 49,627 in the same months of 1891, and during the twelve months ending with June this year but 60,944, against 75,143 during the twelve months ending with June, 1891.

A bulletin just issued by the Canadian census authorities shows that the proportion of foreigners to the total population is almost the same in Canada as it is in the United States, but that while during the last decade the foreign-born inhabitants in the States have, relatively to the aggregate population, increased, in the Dominion the reverse has been the case. In 1881, 14.20 per cent. of the Canadian population were foreign-born, and in 1891 but 13.50 per cent., a decrease during the decade of .70 per cent.; while in this country, on the other hand, the proportion of foreigners to the total population has risen from 13.32 per cent. in 1808 to 14.77 per cent. in 1890, an increase of 1.45 per cent. There are now only 80,480 natives of the United States in the Dominion, an increase of but 2,730 since 1881. All the older provinces except Nova Scotia have fewer resident natives of the United States than they had ten years ago. In an address made not many years before his death, the Earl of Beaconsfield told his hearers that immigrants were pouring into Manitoba from the northwestern States of the American Union. It is an amusing commentary upon this statement to find that in Manitoba today there are only 3,063 natives of this country, and that they constitute but 2 per cent. of the total population of the Province.

The rate of natural increase is doubtless greater among the French than among the English-speaking portions of the Canadian population. On the other hand, the French element, while furnishing probably more than its proportionate share of emigrants to the States, receives little or no reinforcement from immigration. In 1891 there were but 5,377 natives of France resident in Canada, as against no less than 555,648 natives of England, Scotland, Ireland, and the United States. It is not, therefore, surprising that the proportion of the French-speaking to the total population has slightly decreased in the Dominion, as a whole, falling from 30.1 per cent. in 1881 to 29.4 per cent. in 1891, and that this decrease has taken place in every Province except New Brunswick, Prince Edward's Island, and Quebec. It has been relatively the greatest in the new and rapidly growing western provinces. In British Columbia and Manitoba, while the English-speaking population has more than doubled during the decade, the French-speaking has remained almost stationary, and there has been an absolute decrease of that element in Ontario and the Northwest Provinces. The French Canadians are moving southward and to a less extent eastward, and hardly at all westward.

The result of the few remaining elections in England can be predicted with so much certainty as to make it safe to say that the Government will lack forty-two votes of a majority in the next Parliament, and the Ministers must therefore retire. The members will probably stand as follows: Unionist 314, and Opposition 356, but in Great Britain the Unionists are in a majority, having 292 votes to 275 opposed. It is therefore contended by the Unionists that home rule for Ireland has been rejected by those who should confer it, the Irish vote being disregarded as that of an interested party, and Ireland, moreover, being over-represented in proportion to her population. As to the popular vote, it amounts to about 2,000,000 for the Unionists and 2,200,000 opposed. But if the Irish vote were excluded, home rule would not have a majority in its favor. Moreover, owing to the fact that many Unionist seats were not contested, their vote does not represent their full strength. However this may be, the question of home rule is to be settled by Parliament, no matter how constituted, and an Irish member's vote will count for as much in making law as that of an Englishman. But these calculations indicate the policy which will probably be followed by the Unionists, namely, a resort to obstruction and dilatory proceedings, upon the plea that Parliament is not really representative, hoping that the incongruous elements of the Opposition may fall out or prove unmanageable, and so make another appeal to the country necessary. Under these circumstances everything depends upon the conduct of the Irish members, who hold the balance of power; and this being so, the unexpected is as likely to occur as anything that can be predicted before the meeting of Parliament.

THE PULPIT ON THE HOMESTEAD RIOTS.

It was inevitable that there should be a great rush of sermons on the Homestead riots on Sunday week. As many as a score were more or less fully reported in the newspapers as delivered in this city and Boston, in Philadelphia and Pittsburgh, and other cities. Doubtless hundreds were preached throughout the country. It is, in fact, an increasing tendency with clergymen to preach on "topics of the times." This, perhaps, results in part from their deepening sense of the rivalry with Sunday newspapers into which they are more and more brought. However that may be, it was certain in advance that the labor troubles at the Carnegie works, which had been so general a theme of conversation during the week before, would furnish a text for many sermons on Sunday.

As a preparation for their pulpit labors on that day, it is greatly to be wished that the preachers whose discourses we have seen had read and laid to heart an article in the *International Journal of Ethics* for July, entitled, "What should be the Attitude of the Pulpit to the Labor Problem?" Its author is a clergyman, Mr. W. L. Sheldon, and what he has to say is for the most part marked by extraordinary sobriety of judgment. In general, he urges the need of greater modesty on the part of clergymen in their deliverances on the various phases of the labor question. He admits that there is a great temptation to "speak with authority," and "with the same kind of an emphasis on practical affairs as in the sphere of pure religion." But he maintains that, if it is the fact, as he believes it is, that ministers are in danger of speaking from the pulpit as though they possessed "a superior judgment or insight," when in reality they are "speaking on matters they know nothing about," it is better to attempt an humbler rôle, lest even the people who now "listen to us with awe" will find out that the assumption of "wider knowledge" is baseless.

Mr. Sheldon would have the clergy stand on "a much more commonplace level." He would have them admit that they are but men, like other mortals, "waiting for guidance." He advises them, first of all, to make a more thorough study of the relations of labor and capital; to get the point of view of Socialists and Anarchists, as well as the standard writers; above all, to come into personal touch with both employers and wage-earners. This done, he thinks "the supreme work for the pulpit on the labor problem should be to explain and point out the symptoms, rather than to suggest the remedy or cure." An attitude of conciliation and sympathy is the proper one for the clergyman, and is as far as the average minister is qualified to go. If he sets himself to declaring what is just and what is unjust in social relations and in labor difficulties, he will not only fail to accomplish anything, but will soon find that he "has lost his influence for ever."

No such lowly and sensible conception of their true function controlled the tongues of most of those clergymen whose prompt sermons on the Homestead disturbances have been reported in the press. In the majority of cases they spoke as judges and dividers over their fellows, though it is little to say that their utterances were ill-considered, their awarding of blame or praise most crude or dangerous, and their proposed remedies vague and inconsequential. Some of them went great lengths in justifying the riotous strikers. Said the Rev. W. D. P. Bliss of Boston:

"Homestead has spoken to the country. It has thrilled the ranks of labor with new life, new courage, new manliness. Workmen have met and defeated the desperado hirelings of capital, and for their victory we need to thank God."

Dr. Louis A. Banks of the same city "pulled Carnegie over the coals with a vengeance." The Rev. Alfred Henry, "a prominent west-side pastor" of Chicago, "defended and upheld the locked-out millmen, and claimed that all men situated as they were would have done what they did." The Rev. C. H. Woolston of Philadelphia said:

"There has grown up a body of men in this country who believe that the mills, the factories, the mines are the auction-blocks of old, by which they oppress their workmen as they did in the slavery days. One of these said recently that he did not believe in raising the wages of his men because it would give them more idle time. He has not learned that slavery is over. Let the guns that flashed at Homestead proclaim that in this country slavery is over for white and black."

As to the causes of the difficulty, there appears to have been a great diversity of opinion. The Rev. George P. Wilson of Philadelphia thought that "commercialism" was at the bottom of it, resulting in "the alienation of classes," so that "the poor come to hate the Christ of the capitalists, whom they hate." Dr. H. C. McCook of the same city said that the outrages "were the product of our American lawlessness." The Rev. H. Z. Duhring, also of Philadelphia, declared that "organized capital, as represented by the great Carnegie Company, must be held responsible for precipitating the whole trouble." But it was reserved for the Rev. Duncan MacGregor, likewise of Philadelphia, to uncover the *fons et origo* of all, which he did in the following lucid way:

"I will tell the cause. Let it stand out clearly before the whole world. I answer, the cause is social in its nature. I answer, the dash of bullets and blood, of brooms and brushes, of wrathful women and woful sounds of curse and carnage and contagion at Homestead, was the dashing surge of a great subterranean sea—a sea wide as the civil world, a sea that chafes under all civil governments."

When we come to the question of remedies, we find equal diversity in the way of practical suggestions, and great vagueness in the religious cures brought forward. Dr. William Boyd of Newark thought that "the only solution" was for capital and labor "to realize that their relations are not antagonistic but reciprocal, and apply the golden rule." Mr. Woolston of Philadelphia was of the opinion that "the solution of all the workingmen's difficulties is in the ballot." The rhetorical Mr. MacGregor, already quoted, saw hope in the advice: "Let the iron king and the puddler stand side by side as brothers." Mr. Wilson said: "The Gospel of Christ furnishes a sufficient and the only antidote"; but if he stated what it was, the reporter did not catch it. But for the completest and most hopeless statement of the religious remedy we do not need to go beyond what was said in Homestead itself by the Rev. Mr. Thompson:

"When the world shall turn from seeking its own selfish ends, all immoral efforts of self-aggrandizement will be things of the past. We shall then indeed have 'triumphant democracy.' When Carnegie is not king, but when Christ is the acknowledged Lord of Hosts [sensation], then the lion of capital shall lie down with the lamb of labor, and there will be no Pinkertons to destroy or harm."

It would probably be unfair to judge the pulpit as a whole by such melancholy instances. We gratefully record the fact that many clergymen were silent on the riots, and thereby did a great deal to raise the reputation of their profession for intelligence. But the extracts we have cited are enough to show that the partial knowledge and the uncertainty which clergymen display in private conversation about labor troubles, do not pass into certainty and authority as soon as they mount the pulpit stairs. There can be no doubt that, as intermediaries between employers and workingmen, ministers are in a position to do a work within the power of no other class; as social theorists they are so plainly without inspired wisdom that we think it would be far better for them to take Mr. Sheldon's advice and not speak as if they had it.

WARRING PROTECTIONISTS AT HOMESTEAD.

The Homestead episode has given rise to some moralizing on the part of the protectionist press which is sound enough, as far as it goes, but which rests upon principles of much wider application than these journals recognize. They counsel the riotous workmen that they have no right to exercise any compulsion in obtaining from their employers such remuneration for their labor as they desire, or in preventing other workmen from taking their places. They have a right to obtain as high wages as possible in a free competitive market, and to enter into combination with one another for this purpose; but this right, if it exists at all, is necessarily common to all men, and its recognition implies the condemnation of practices inconsistent with it. Trade unions are, therefore, laudable institutions in so far as they assist their members in obtaining the fair market value of their labor, but they become mischievous when they are employed in depriving capitalists of the use of their property, or

in depriving workmen who are outside of the unions of their inalienable right to support themselves by laboring for whoever wishes to hire them. And what is right is also expedient, for the interests of workingmen are bound up with those of the community, and that community will be most prosperous in which capitalists are most encouraged to invest their money by the knowledge that they will be protected in the free use of it, and in which laborers are sure of obtaining employment without encountering any other hindrances than such as are involved in the natural adaptation of the supply of labor to the demand.

These principles, it is unnecessary to remind our readers, we have steadfastly endeavored to maintain, even at times when there seemed to be a pretty general disposition to ignore them. They need to be laid down, over and over again, line upon line and precept upon precept, for they are by no means intuitively apprehended by mankind, but have been evolved by a very long and painful experience of the evils of oppression, and every generation has to be educated up to them. In fact, their apprehension constitutes political education, and a community where they were universally accepted would find little practical difficulty in acting upon them. Simple as they are, they are but special cases under a more general principle—the principle that every human being is entitled to pursue happiness in his own way, subject only to such limitations as experience has shown to be indispensable to the maintenance of this right for all. This is the spirit which breathes in our Declaration of Independence, this is the principle which is formulated and applied in our Bills of Rights and in our Constitutions. It is the recognition of this principle that has given the institutions of our country their wonderful stability, and it is only by disregarding this principle that these institutions can be overthrown.

But with what consistency can protectionists preach such doctrines as this to the members of the trade unions? Why do they behold the mote that is in the laborer's eye and consider not the beam in their own? It is of the essence of the theory of protection that the free exchange of the products of labor should be restricted in order that those who have procured the restrictions may dispose of their products at enhanced prices. To accomplish this end, they resort to the very means which they condemn when resorted to by laborers, viz., compulsion. They endeavor to deprive those who would employ their capital in certain directions of the opportunity to use it as they choose, just as the Homestead laborers endeavor to regulate their employers' use of their own property. They endeavor to prevent laborers from selling their labor in a free market for the best price that it will bring, just as the trade-unionists endeavor to prevent non-union laborers from working at trades which the unionists wish to monopolize. For it is a natural right that a man should exchange the wealth that he has produced for other wealth that better satisfies his wants, whether that other wealth be produced in this country or elsewhere. It is also a natural right that a laborer should expend his strength in producing goods for exchange, without having his remuneration lessened by tolls levied upon the materials that he employs and upon the goods that are exchanged for his products. If it is justifiable for an American manufacturer to compel the farmer who sells his wheat in Liverpool to pay a tax upon the clothing or the tools that he receives in exchange, or else to pay a higher price for the protected articles, it is justifiable for the Homestead workmen to compel their employers to pay them higher wages, or else allow their works to lie idle. If it is right for American manufacturers to force their fellow-citizens to buy their wares through the means of a protective tariff, it cannot be wrong for American laborers to force the manufacturers to buy their services by excluding fellow-laborers from the competition.

It may be urged that what the manufacturers do is done in conformity to the law of the land, while the aim of the laborers is illegal. But the objection is irrelevant, for the admonitions addressed to the Homestead workmen have not been based upon legal grounds, but upon the principles of justice and expediency which we have stated above. All that we contend is, that these principles cannot be invoked by protectionists in condemnation of the course of the Homestead workmen without condemning themselves. And it must be added that in procuring the sanction of the law for the compulsory payments which they have exacted from the country, the protected manufacturers are believed by nearly if not quite a majority of its inhabitants not only to have abused the powers of government, but also to have put themselves in position to do so by the expenditure of money. It is not from devotion to the cause of good government that the Senate has come to be filled with men of great wealth representing the protected interests, and we should perhaps not now be living under the McKinley tariff had not Mr. Wanamaker obtained from these interests the $400,000 which he put in Mr. Quay's hands a few days before the last Presidential election.

There remains but one argument to which protectionists can resort. They say, and doubtless many of them sincerely believe, that the increased profits which they obtain by taxing their fellow-citizens are expended so as to promote the general welfare. The conclusive reply to this is, that the same would be true of the increased wages which trade-unions may secure by compelling their employers to pay them higher wages than non-union laborers are willing to work for. Every consideration which is appealed to by manufacturers can be appealed to with equal force by their employees. It would only be necessary for these employees to secure legislation compelling employers to hire only union laborers, in order to put them upon exactly the same footing as protected manufacturers. If law makes right, they would then occupy a position equally defensible morally. Such legislation has been adopted by the London County Council, so far as lay in its power, and recently came near passing the national assembly of France. It is most earnestly to be desired by those who have the future welfare of this country at heart that such a policy as this may never be adopted here. But if we are to escape it, with all the corruption and oppression and ruin that will attend it, the policy of protection to favored manufacturers must be definitely repudiated, for the two policies are identical in principle. The public conscience has been so long debauched by protectionist excesses that it is not easily aroused; but it would be an evil omen were the riot and bloodshed at Homestead not to awaken thoughtful men to the dangers of tolerating longer the perversion of the Government, which is maintained by all, to the pecuniary support of favored classes.

AN OBJECT-LESSON IN CURRENCY EXPANSION.

THE Treasury bulletin, showing the amount and distribution of the country's money supply at the opening of the current month, gives data for an interesting chapter of financial history. Comparison will naturally be made with the statement of the same date in 1891; for the intervening period is the Government's fiscal year, and it is the events of that period with which the Treasury officers must presently deal in making account of their stewardship.

What will first attract attention in the comparison of results is the remarkable expansion in the circulating medium. Excluding the funds held in the Treasury, the money in use in the United States has increased during the year no less than $105,632,631. This increase has been paralleled but three times in our financial history, and on each of these occasions the increase was directly traceable to the great civil convulsion of the sixties. In the fiscal year 1863, the currency expansion of nearly $261,000,000 was due wholly to the new issues of State bank notes and of Government legal tenders, the bill authorizing which was enacted immediately before the fiscal year began. In the other two years referred to, 1880 and 1881, the resumption of specie payments, followed by the conversion and heavy redemption of the old war loans, turned enormous amounts of gold out of the Treasury and into general circulation.

No convulsion, civil or other, preceded the latest movement for currency expansion. It was the result of an experiment made under no pressure of necessity, and solely in deference to an extrava

gant financial theory. It has been already observed that the increase of 1863 consisted of greenbacks, and that of 1880 and 1881 of gold. Of last year's increase in the circulating medium, over $57,000,000 was in Treasury notes based upon purchased silver bullion, $19,500,000 in silver certificates, $4,000,000 in fractional silver coin (which this Administration has used with unprecedented eagerness to pay its bills), and the rest—thanks to the accident of a rich harvest and large imports of specie during the winter—in gold. How much of a figure the gold will cut in next year's returns, if Secretary Foster is driven to the last resort of selling bonds in order to keep good his specie reserve, may readily be imagined.

There is nothing novel in the general facts thus pointed out. To the silver-coinage fanatic they are undoubtedly gratifying in themselves; for certainly we have here the "increase in money"—particularly silver money—of which there has been so much eager talk. The country's money circulation per capita, which for a decade had averaged $22.50, the supply keeping remarkably even pace with the increase in population, rose abruptly in 1891 to $23.41, and in 1892 to $24.47, and here, no doubt, the free-coinage agitator will find food for especially agreeable reflections. We cordially recommend his use of these statistics in the manufacturing districts and among the cotton-growers of the South. An application of his favorite theory to these very figures, whereby he might demonstrate that each of his hearers is by virtue of statistics 9 per cent. richer than he was in 1889, would be a practical and altogether commendable means of bringing his opponents to book. The South, through its Representatives in Congress, has been and is still pleading persistently for currency expansion, with a vague notion that if there could only be "more money to go around," the Southerner would be sure to capture a share of it. Well, here is the currency already expanded, and yet the petitioner is complaining that he has been losing money ever since 1890. If an increase of a hundred millions in the country's circulation has been attended on his part by increasing poverty, what is he to expect from further expansion?

When the farmer can rid himself of the pestiferous notion that he is bound to get his share in the new money, on a basis of numerical proportion, whether he has anything to exchange for it or not, the "silver problem" will be near its solution. The cotton-grower's stock of money steadily decreased while the Government's stock of manufactured money was as steadily increasing; and the reason was perfectly plain. The cotton markets were over-supplied, and nobody needed the planter's product badly enough to pay the planter's price for it. If the money in circulation to-day were twenty-six hundred millions instead of sixteen hundred millions, the situation would be exactly the same. The silver-miner sells his bullion to the broker, and the broker sells it to the Government, and the Government pays him in "expanded currency." Somebody makes a handsome profit out of the operation, but it is not the farmer, nor the merchant, nor the salaried employee, nor even the Government. The man who gets money which he would not otherwise have had, is the man for whose product the Government has created an artificial market. The place where the money finally reposes, at the present time, is most likely to be the great city banks, which already, in the dull business year, have more deposits than they know what to do with.

A much more profitable field of investigation for the unfortunate cotton-planter would be the conditions which regulate his along with other trades. If he would but heed the signs of the times, he might discover that violent fluctuations in the circulating medium, such as he and his representatives have been forcing upon the country, destroy confidence, paralyze industry, and bring down their first and heaviest load of calamity upon the heads of the very people in whose name the experiment was demanded.

COEDUCATION IN GERMAN UNIVERSITIES.

THE question of the higher education of women in Germany seems about to enter upon a new stage. The Government, a few months ago, required each university to express its opinion upon the expediency of admitting women to lectures; and several, notably Göttingen, have declared themselves in favor of doing so. Prof. Herman Grimm has undertaken to speak for the University of Berlin, and he publishes his conclusions in an article in the Berlin *National-Zeitung*, which is a model of dispassionate reasoning, and is sure to attract wide attention.

He summarizes at the outset the prevailing objections to coeducation in general, which are nowhere urged more strongly than in Germany. In the first place, there is an impression that women are, from their very nature, incapable of acquiring the thorough knowledge which is expected of every boy as a matter of course.

"I myself," says Prof. Grimm, "shared this opinion without being able to account for it. Our very women believe it to be true. In other countries people think differently. In England and America there exists a mass of biographical literature bearing on the careers of men and women. There coeducation of young men and women is considered as something the expediency of which need not be demonstrated."

The German girl, it is true, is much less self-reliant than her American and English sister, but is not this very difference the result of different educational methods? A German girl is hardly ever educated with a view to her being obliged to support herself, and yet not only to the women themselves and their relatives, but to the State, is it of vital interest to educate them so as to make them self-reliant and, if necessary, self-supporting. Practically, only two avenues are open to women desiring a higher education, namely, the practice of medicine and the profession of a teacher. The need of female physicians has been so clearly demonstrated as to open for them the doors of some European universities. Can the State afford to do less for those who wish to become competent teachers?

The objections urged against the admission of women to the lectures in the philosophical faculty are twofold. There is the still lingering fear that the young men may be affected unfavorably by the presence of the women—a fear dispelled by the experience of the United States and England; and there is the belief that the supposed intellectual difference in the two sexes, or, at all events, the difference in their receptivity, would make it difficult for the teacher to adhere to one standard in addressing a mixed audience. Prof. Grimm seems disposed to accord full weight to the latter objection. A lecturer, in order to be in full *rapport* with his hearers, must address a homogeneous audience. Speaking for himself, Prof. Grimm says, he might perhaps object to the admission of women because he found it difficult to depart from his established custom in addressing young men only; and if he admitted women at all he would tell them frankly in advance that their presence would be ignored. But while, apparently, an adherent of the theory which assigns to men and women different reasoning powers, he is very far from conceding that a woman's intuitive perception can in any way be impaired by severe application to studies.

"Such an assumption," he says, "is not borne out by a single example. To restrain women on such grounds from the study of literature and art, or to lower the standard of these studies, either in form or in substance, in the case of female students, is entirely out of the question. If there is a public demand for female teachers of literature and the history of art, it would be wrong not to offer aspirants for such positions the most thorough public instruction, suitable alike to men and women. If I continue to lecture in my old way and ignore my few female listeners, it may well be hoped that my successor will be better fitted for his task. Surely, no such differences are recognized in the study of mathematics and physics."

Prof. Grimm is too great an admirer of the German universities, "perhaps the only corporate bodies whose right of self-government seems incontestable," and too jealous a guardian of the rights of the German student, to favor an enforced change to coeducation. It may be that the State will ultimately find it expedient to establish separate institutions for the instruction of women; but until that is done, it certainly seems judicious to ask the existing ones to open their doors, wherever possible, to well-qualified female applicants. "To compel university professors," he says, "to admit women, seems inconceivable, but it would seem to be equally impossible to enforce ancient restrictions concerning the admission of women, or to prevent professors from exercising their discretion in the

light of existing conditions." He illustrates his own practice in this respect as follows:

"Some time ago there called upon me an American lady, the daughter of German parents, who, as she said, had received leave of absence from her husband for the purpose of studying in Germany the history of art. She and her husband were amateur photographers, and she had thus imbibed an interest in the subject, and intended to deliver lectures on the history of art in the city where she resided and where much interest was taken in the subject. In fact, she had done so already, but she felt, in spite of a fair acquaintance with the general literature of the subject, that her lectures were a more or less mechanical reproduction of her own reading, and that it would be necessary for her to study in Europe. She had visited England, France, and Italy, and wanted now to finish her studies in Germany. She was free to confess that wherever in this country she had so far applied for instruction, she had been unable to impress the instructors with the seriousness of her aims, and she therefore requested me earnestly to give her permission to attend my lectures.

"I was most favorably impressed with the evident truthfulness of this lady, who was accompanied by her daughter, a charming girl of thirteen. Nevertheless, I could not grant her request, but I induced one of my colleagues, Prof. Frey, to give her once a week instruction in the literature of art history, which enabled her to prosecute her studies at home. Prof. Frey was highly pleased with the diligence of his pupil, who at the end of the semester returned to America to utilize her newly acquired knowledge in procuring a library devoted to art history for her native town.

"About the same time there called on me another American lady, a teacher, who also wished to attend my lectures, particularly those on German literature. She spoke as intelligently and with as much knowledge of her subject as did the other lady, and I recommended her also to a colleague of mine, who instructed her and was very well satisfied with her progress. A few days ago she again called on me, and once more asked for permission to attend my lectures. I granted the request, but I do not consider that I have established a binding precedent, and shall reserve the right of saying yes or no in each individual case."

Prof. Grimm forcibly contrasts the rather humiliating position which German women bent on intellectual pursuits occupy in their country, with the greater freedom enjoyed by women of equal intelligence elsewhere. He says that not a few literary women of his acquaintance —not writers of fiction, but scientific workers in the best sense of the word— are positively embarrassed by their position, and "fairly apologize for having done such good work." He points to the United States and England, where women have long since taken their recognized place in science, and are able to hold their own in conversation with men of eminence with a confidence born of equal opportunities and equal rights. "A German woman interested in the intellectual problems of the day involuntarily shrinks from discussing them with men, because of the depressing consciousness of her defective training." This feeling of inferiority reacts, in turn, on the men, whose domestic life suffers from the lack of common intellectual interests between them and their wives. The evil is augmented by the excessive devotion to music on the part of the women, which crowds out more profitable employments and leads to "intellectual ossification."

The old prejudice which sees in the pursuit of knowledge by woman a departure from her place in nature Prof. Grimm does not consider worthy of discussion. Women have at all times been compelled to devote their attention to business matters, and it has never been asserted that they neglected on that account their duties as wives and mothers. Is it, then, to be assumed that they will be less dutiful if devoted to science and art? Prof. Grimm lays particular stress on the important position won by women within recent years in the realm of art, owing entirely to the more adequate instruction now within their reach. He speaks with all the authority of one who is generally considered the foremost art critic in Germany when he says:

"I well remember the general status of female portrait-painting thirty years ago. A picture by a woman at once proclaimed the insufficiency of her instruction. Artists like Angelica Kauffmann and Mme. Lebrun were exceptions belonging to a remote past, whose recurrence was not to be looked for. The first artist whose work was like a man's was Rosa Bonheur. But he who traverses the Berlin art exhibitions of to-day will have to admit that perhaps the majority of all good portraits are the work of women. It is true, many of these portraits have no high artistic merit, but neither have the portraits painted by men. Formerly a portrait painted by a woman betrayed a certain want of clearness, a lack of correct modelling, as well as a vagueness of outline. These defects are still found in some; in others they have entirely disappeared, and the reason of this lies entirely in the changed instruction."

Prof. Grimm, it will be seen from this brief summary of his exhaustive essay, cannot be called an enthusiastic advocate of coeducation, but he takes a scholarly, patriotic, and humane interest in everything pertaining to the intellectual advancement of women in Germany. "Men have no right," he says, "to prohibit women from making use of public institutions where they believe they can acquire the knowledge they need; for there exists to-day a universal disinclination to be unjust." This sentiment ought to lie at the root of all discussion of the subject, and deserves to be pondered in other countries besides Germany.

TERCENTENARY OF DUBLIN UNIVERSITY.

DUBLIN, July 9, 1892.

IT is a commonplace to say that seats of learning are among the most enduring of human institutions. It will be readily admitted that any great educational institution which, like Trinity College, Dublin, has lasted, with a growing fame, for 300 years, is amply entitled to celebrate its tercentenary with appropriate honors. In the Memorial Ode which was sung at the commemoration of its first centennial anniversary, Nahum Tate, the poet-laureate of the occasion, was fain to predict for his Alma Mater, even at that day, a splendid future which

> "Should Liffey make as proud a name
> As that of Isis and of Cam";

and though this pious augury of the College bard may not as yet have been fully realized, yet it is none the less true that Trinity College, while sedulously preserving its distinctive place in the university culture of the United Kingdom, has moved steadily forward in the widening range of its studies, in the multiplication of its schools, in the increasing fame of its graduates, and in the growing number of its students.

Founded by Queen Elizabeth as a bulwark and defence of Protestantism in a land faithful to the "Old Church," and endowed with many munificent gifts by her successors and by the other patrons of learning whose names are publicly recited in Trinity Chapel on the afternoon of every first Trinity Sunday in the Church year, the College is rich to-day in its annual revenues, in its commodious halls, in its famous library, in its well-equipped astronomical observatory, and in the emoluments of its fellowships. Almost all the buildings which give it an architectural dignity are said to date from the eighteenth century. In a sumptuous memorial volume, entitled 'The Book of Trinity College, Dublin,' a copy of which has been courteously presented by the Provost and Senior Fellows to all the delegates from sister institutions in attendance at the tercentenary celebration, it is stated that during the eighteenth century "a new conception of what the country owed to the University and the University promised to fulfil, entered into men's minds. Grants of hundreds now became grants of thousands; salaries were no longer pittances but prizes; the Fellows of the College became dignitaries not only on account of their position but their wealth; and the much-tried and long-struggling College at length attained security, respect, and influence throughout the country." The curriculum of the College, from being fixed by what is known as the "statutes of Laud," and from being conducted in a purely catechetical way by oral exercises, was gradually released from its theological tether and from its cast-iron moulds, and was broadened in its scope, while being at the same time liberalized in its methods of instruction.

The earlier part of the present century marks, it is true, a period of decadence, or rather of suspended vitality, in the history of Trinity College. It was during this period that, in the dearth of her culture, she was dubbed "the Silent Sister"—a name which still clings to her in the "jocosities" of academic banter, though she has long since lived down the reproach. Certainly we cannot say that any sister in the academic family deserves to be called tongue-tied who has been the nursing mother of sons so numerous, whose words have gone out to the ends of the world. The names of but a few can be recited here. James Ussher, the learned Archbishop of Armagh, whose Old Testament Chronology still survives in some editions of the King James Bible; Henry Dodwell, the prolific writer of his day; Farquhar and Congreve, playwrights whose dramas are still read by students of English letters; Thomas Parnell, known to all by his "Hermit" and his "Hymn to Contentment"; Toplady, whose "Rock of Ages" is sung in the churches of universal Christendom; Charles Wolfe, whose lyric on the "Burial of Sir John Moore" has made the tour of the world; Thomas Moore, whose Anacreontics and "Lalla Rookh" have delighted so many men and maidens in the salad days of their youth; Sir Philip Francis, reputed by many besides Lord Macaulay as the author of the Junius Letters; the good Bishop Berkeley, whom Alexander Pope, no lavish eulogist, has praised as being adorned with "every virtue under heaven"; Bishop Magee, the redoubtable champion in his time, of the Trinitarian theology; Richard Brinsley Sheridan, orator, wit, and dramatist; the pure-hearted Lord Falkland, who fell on

an early battle-field of the Great Rebellion, "ingeminating 'Peace, peace,'" as Clarendon phrases it; orators like Plunket and Curran and Grattan; barristers and jurists like Barry Yelverton or Sir Jonah Barrington; critics of philosophy like William Archer Butler; mathematicians like Sir William Rowan Hamilton, the inventor of the Method of Quaternions, who finds, in a different branch of mathematics, a worthy successor in the present Provost of Trinity College, Dr. Salmon; novelists like Charles Lever, whose description of college life in 'Charles O'Malley' is dear to all the sons of Trinity—these and such as these shine as stars in the crown of Dublin University.

But perhaps the three greatest names which Trinity College carries on the roll of her graduates must be sought in Oliver Goldsmith, Dean Swift, and Edmund Burke. It has been said of the University of Leyden that it would have abundantly vindicated its right to be if it had produced no other alumnus than Hugo Grotius, the founder of International Law. Certainly as much may be said of the University (Dublin University and Trinity College, it need not be said, are convertible terms) which has produced an Oliver Goldsmith, whose 'Vicar of Wakefield' still maintains its classic place even in this novel-reading age, which trained the genius of a Dean Swift, in whom the melancholia of a cynic, the mocking wisdom of an Irish Democritus, and the heart of a statesman were concealed beneath the surplice of a priest, and which gave to the world an Edmund Burke, in whose writings, as Coleridge thought, the germs of all political philosophy may be found for the instruction and reproof of this living age.

We are reminded by the compilers of 'The Book of Trinity College' that Oxford has been called "The University of great movements, Cambridge, the University of great men." We are reminded, too, that Oxford has been called "the home of lost causes, and forsaken beliefs, and impossible loyalties." But for the Irish sister of these renowned seats of learning it is claimed that she has had a far different career from that of either, not only because she is younger in years, but because she has a type of culture essentially her own. The Irish College, it is frankly conceded, does not lie, like the Oxford "Queen of Romance, steeped in sentiment and whispering from her towers the last enchantments of the Middle Ages." It is admitted, even by the most loyal of her devotees, that to sentiment Trinity is a stranger. She lives in a workaday world, because she lies at the heart of a metropolis, and no one, says the writer from whom we are quoting, "who knows her history or who has breathed her keen, disillusionizing air, would conceive as possible the fostering of an intellectualism such as that of Newman under the shadow of her Greek porticos." And, it is added, "when we call to mind her position in the heart of a country misunderstood and misgoverned for centuries, we cannot but marvel that she has so serenely kept the *via media* between political, philosophical, and social extremes. At once less conservative and less radical than her sisters, a dry intellectual light has been her guide."

Such, in brief, is the venerable seat of learning which has summoned the literary and scientific world to bring to her the homage of its congratulation on the occasion of her tercentenary commemoration. And representatives of the learned world have come at her bidding from all the continents—from Africa, Australia, India, New Zealand, Russia, Austria-Hungary, Italy, Germany, Holland, France, Belgium, Denmark, Norway, Sweden, Switzerland, Canada, the United States of America; and of course from England, Scotland, and Wales in still larger delegations. And the preparation which the Trinity authorities made for the entertainment and amusement of their invited guests was indeed most profuse and elaborate. From Tuesday, the 5th of July, to the close of the week, the streets of Dublin have been filled with all the pomp and pageantry of an academic festivity. Religious ceremonies, musical fêtes, garden parties, banquets, games, conferring of honorary degrees, presentation of addresses of congratulation, etc., have followed each other in quick succession.

First in the order of exercises was the formal presentation to the Provost of all the delegates who had been commissioned by learned bodies, by universities, and by colleges to bring their congratulations—each delegate being introduced by his full name, with his titles and the institution he represented. Then followed a procession of all the delegates, with their Trinity College cortège, from the College to St. Patrick's Cathedral; each delegate, with few exceptions, being arrayed in academic costume, and the whole procession marching by a route about a mile long between serried masses of observers on the sidewalks. At St. Patrick's, the "Commemoration Service" was celebrated with appropriate religious ceremonies—with processional hymns, prayers, anthems, and a sermon. The latter was delivered by the Very Rev. Henry Jellett, D.D., the Dean of St. Patrick's. The discourse was in the main a retrospect of Trinity's history—the shadows of her past being used to heighten the lights of the present; but the speaker ventured a single touch of pathos when, adverting regretfully to the pending breach between modern culture and Christianity, he wondered whether the four hundredth anniversary of the University would be celebrated in a purely secular spirit. Appropriate allusion was made to the fact that Trinity College, in commemorating her tercentenary, was also called to commemorate the centennial anniversary of that liberalizing change which, just a hundred years ago, had made her degrees accessible to Roman Catholics and Nonconformists on an equality with adherents to the Established Church. One touch of politics there was in the sermon. Dean Jellett remarked that with all the misrule to which Ireland had been subjected, no British Minister had yet dared to lay his hand on the franchises of Trinity College.

The Tercentenary Ode was written by "The Irish Poet-Laureate," Mr. G. F. Savage-Armstrong, and was set to music by Sir Robert Stewart. It was rendered before a brilliant auditory in Leinster Hall on the night of Tuesday, the 5th of July. A cricket match in the College Park—a Cambridge eleven against Dublin University—and a garden party in the Fellows' Garden, had occupied the afternoon.

At noon on Wednesday, the 6th of July, the academic conclave assembled in the Examination Hall to witness the conferring of honorary degrees. The University had been liberal in the dispensation of these honors, though it was difficult in some cases to perceive the theory on which they had been distributed. Five Americans were decorated on the occasion—Gen. Francis A. Walker receiving the degree of Doctor of Laws, Prof. Simon Newcomb the degree of Doctor of Sciences, Dr. John L. Billings the degree of Doctor of Medicine, Prof. Isaac Hollister Hall and Prof. Joseph Henry Thayer the degree of Doctor of Letters. The University showed its liberality to the New Theology by conferring honorary degrees on the Rev. Samuel Rolles Driver and on Prof. Robertson Smith, while culture was seen to be broader than creed when an eminent Unitarian like James Martineau was selected for decoration on this signal occasion. The investiture of Henry Irving with *his* degree was made the occasion of a demonstration by the undergraduates, who, after the ceremonial was ended, bore him aloft across the campus in a chair, amid an acclaim of loud huzzas, and then exacted from him the tribute of a speech.

A garden party at the Viceregal Lodge, given by the Lord Lieutenant and Lady Zetland, and a continuation of the cricket match between Trinity and Cambridge, filled up the afternoon. In the evening came the grand tercentenary banquet given by the authorities to the delegates assembled from all parts of the learned world. Like everything else provided for the occasion, the feast was sumptuous in all its appointments, and if the post-prandial speaking did not, in all cases, reach high-water mark in that difficult walk of eloquence, it was above the English average. The speeches of the Right Hon. David Plunket and of Prof. Lannelongue of Paris (in French) may be signalized for special commendation. The speech of Mr. Lecky, the historian, though good, was heard only indistinctly by the vast auditory of *convives*, about 600 in number.

But Thursday, the 7th of July, was the great if not the last day of this university feast. This was indeed the day for which all the other days of the festivity were made—the day on which the addresses of congratulation from the universities and learned bodies here represented were formally handed in to the Chancellor, the Earl of Rosse. The procession of delegates charged with these letters of felicitation was formed on the College campus at eleven o'clock in the morning, and moved through the streets, in all the many hued bravery of academic costume, to the Leinster Hall. After an address from the Provost, the representative of each college, university, and learned institution was formally called up to lay his address of congratulation on the table behind which the Chancellor was seated, who, after receiving the address, gave to each delegate a hearty handshake. The delegations were first called out according to their respective nationalities, and an address on behalf of each nationality was made by a spokesman selected for this purpose. President Gilman spoke for the American delegation, and of course spoke well. Most of these addresses were made in English. Prof. Richet of France, Prof. Gaudenzi of Italy, and Prof. Kollmann of Switzerland, however, spoke in their vernacular, but with a distinctness of articulation which rendered their speeches perfectly intelligible. Vámbéry spoke for Hungary, and spoke with an oratorical *verve* which kindled the enthusiasm of his auditors, both on the floor and in the galleries. For it should be said that the galleries were filled with ladies, who "rained influence" down on the gowned scholars as they marched one by one to the Chancellor's chair; while in the rear a throng of Trinity's lively undergraduates kept up, ever and anon, the merry jest and gibe (in which the undergraduate soul is wont to delight), as if to show that Trinity is not a "Silent Sister," in the person at least of the "babes and sucklings" whom she is now rearing for the battles of life. But not a word was said to mar the dignity of the ceremonial.

In the afternoon of the 7th a garden party was given by the Commander of the Forces and Lady Wolseley at their Kilmainham Mansion, so noted for its hospitality. Here, as at the other garden parties, the delegates received that same cordial greeting which, during the whole of this festival, has so beautifully blended social courtesy with academic formality. On the evening of the 7th the undergraduates gave a play, in one act, illustrative of college life. The play was full of crisp and pungent points, and was evidently intended, as one of the local journals phrases it, to show that college life at Trinity is not altogether "a dull, staid, and plodding business," but allows "scope for mental resource, and felicity of conception and expression which, in one direction or another, maintains the repute of Trinity as the fount of many varieties of skilful and noble literary achievement."

On Friday, the 8th of July, addresses were made to the Trinity students in the Examination Hall, by certain of the University's guests, and the whole series of pageants and revels was closed in the evening by a grand University ball in Leinster Hall. All things must have an end, and so the tercentenary celebration of Trinity College, Dublin, came to an end where a thousand hearts were beating happily under the inspiration of Terpsichore—the Muse who is sure to have her "innings" after the College Dons have had their day in court. J. C. W.

JANET'S FÉNELON.

PARIS, July 6, 1892.

I OPENED with interest a little volume by M. Paul Janet on Fénelon—a volume in Hachette's new series, "Les Grands Écrivains Français." Not that there is much to learn about Fénelon, his dispute with Bossuet, his relations with the Duc de Bourgogne, with Mme. de Maintenon. Still, though the facts are well known, Fénelon's character is very complex, and there remains in some parts a sort of mystery hanging over him. His relations with Mme. Guyon are particularly interesting, and M. Paul Janet has entered into many details on this point. He is himself a philosopher and a professor of philosophy, and he can treat with competence the theological questions which for a moment divided Bossuet and Fénelon.

We are all familiar with Fénelon's portrait. He has been well described by Saint-Simon; but whom did Saint-Simon not describe well?

"This prelate was a great thin man, well made, with a high nose, with eyes out of which fire and soul came forth like a torrent, and a physiognomy of which I have never seen the like, and which could not be forgotten, once it had been seen. It united all the contraries, and they were not at war with each other. It had gravity and *galanterie*, seriousness and gayety; it savored equally of the doctor, the bishop, and the *grand seigneur*. What emerged from it and from his whole person was thought, wit, grace, decency, and especially nobility. It required an effort to cease to look at him."

Fénelon was born at the Château de Fénelon in Périgord, August 6, 1651. He was of an old family, the Salignac de la Mothe-Fénelon. By the advice of his uncle, the Marquis of Fénelon, he entered the Seminary of Saint Sulpice. After he had ended his theological studies the Archbishop of Paris placed him at the head of a new congregation, the "New Catholics," composed of ladies recently converted from Protestantism, who were to be well maintained in their new faith. The task was an easy one for Fénelon, who was a born director of consciences. He was soon afterwards sent as a missionary to Saintonge and to Poitou, where the Protestants were to be converted, and he found himself thus for a moment mixed up with the great affair of the revocation of the Edict of Nantes. We have some letters of his, written from Poitou; they bear no trace of any indignation at the revocation, of any protest against the means employed by the intendants; they show, however, a preference for persuasive means, a natural aversion to violence, "which would have for its effect innumerable sacrileges."

Fénelon's first work of importance was the book 'De l'Éducation des Filles.' It is still read with pleasure. Fénelon was more liberal than his time in the matter of the education of women, but he is so far behind our time that we need not speak much of his plans and methods. The book is more interesting to us as an indication of the great drawing which Fénelon felt towards the other sex; the way in which he speaks of women betrays a certain sort of tenderness, of delicacy, of softness, which afterwards took other expression when he came in contact with interesting women. Fénelon, as is well known, undertook the education of the Duc de Bourgogne; he turned a violent, haughty, irritable, overbearing young prince into the mildest, most docile and obedient of men. But may it not be said that he feminized him too much—more than he himself wanted at first?

The two women who had a paramount influence over Fénelon were Mme. Guyon and Mme. de Maintenon. M. Janet speaks at length of Mme. Guyon, and we are grateful to him, for the history of her relations with Fénelon is one of the most curious chapters of the intellectual and religious life of the seventeenth century in France. Who was this Mme. Guyon who made so much noise in her time? She was born at Montargis in 1640. Her education was neglected, her health was deplorable. She belonged to a good family, the La Mothe, but was married at the age of fifteen to an old and gouty man, Guyon, brutal, violent, ill-mannered. She married him two days after having seen him for the first time. She was unhappy, and threw herself for consolation into piety. She was of an hysterical disposition, and her piety was of a peculiar sort. She mortified her flesh and fell into curious trances. Bossuet, in his 'Report on Quietism,' copied some passages of Mme. Guyon's autobiography, confided to him in manuscript. We read in these extracts that she "felt like a nurse bursting with milk, like a basin of water that overflowed." These are not mere metaphors. "It was," says Bossuet, "in one of these accesses of fulness that once the Duchesse de Béthune had to help her undress, as her stays had broken open on two sides." I do not know how doctors would now explain these hysterical trances. Mme. Guyon had periods of great religious effervescence, followed by periods of dryness. She fell in with Father Lacombe and introduced him into mystical life. She goes to Geneva, and enters the convent of the "New Catholics," but stays not long. She wanders to Turin, Grenoble, Marseilles, Alexandria, Genoa, Vercelli. She returns to Paris; Father Lacombe is sent to the Bastille and she herself is shut up in a convent. By the intercession of Mme. de Miramion and of Mme. de Maintenon, who was a friend of Mme. de Miramion, she is delivered from captivity after six months. At the Duchesse de Béthune's she meets Fénelon and returns alone with him from the country to Paris. "He saw her," says Saint-Simon; "their two minds suited each other."

Fénelon introduced Mme. Guyon into the chosen circle of the Beauvilliers and Chevreuses, of Mme. de Maintenon. She read to them her book, the 'Moyen court et très facile de faire oraison.' This book was an event. What is the definition of *oraison*? It is not a prayer, it is a state of prayer, it is "an act of love," an act "of the heart," a mystical state. Let us dismiss all vocal prayers, the Lord's Prayer and others; let us feel our heart burning gently; let us abandon our individuality, give ourselves away to God, repose in Him. "Outward virtue is nothing"; the true state of *oraison* is a passive state. Imagine such ideas expressed in fine language, by a fascinating woman, in a circle of refined persons. Mme. Guyon made proselytes. It is needless to show the dangers of a doctrine which, in a religious garb, is the abolition of human liberty. The doctrine bore, in the theological world, the name of quietism; it had a few years before been formulated coarsely by the Spanish monk Molinos. Quietism was a perpetual state of love; in this state all reflection was to cease; the soul ought to become indifferent to everything—even to perpetual salvation; all external acts became useless; the quietist must abandon his free-will to God, and consequently need not resist temptation. The acts of the corporeal and sensitive part of man become strangers to the spiritual part, and the body may become the instrument of the devil while the soul is irresponsible.

The consequences of this doctrine need not be dwelt upon. Mme. Guyon's quietism did not take such a decided turn; it surrounded itself with more precautions, it was a pure mysticism; but, in reality, it ended in the abolition of human liberty. Fénelon fell under the charm of Mme. Guyon. At the bottom of the theological quarrel which arose between him and Bossuet was the old question of grace. The Church felt perplexed: it could not adopt quietism in any form; it could not condemn the mystics who had added so much to its own glory. Bossuet represented the hard common sense, the severe doctrine, which requires works; Fénelon represented unconsciously the doctrine of justification by faith. In a letter written by Fénelon to Mme. de Maintenon he says, speaking of Mme. Guyon: "I have seen her often, I have esteemed her; I have allowed illustrious persons to esteem her who had confidence in her." Fénelon refused to recognize in Mme. Guyon the principles of Molinos; it is clear, however, that Mme. Guyon's new mysticism led to quietism. We cannot be much surprised that Bossuet attacked her doctrine. I will not give even a short account of a theological war which would now be well forgotten if it were not for the famous names of Bossuet and Fénelon. Who reads now the 'Maximes des Saints,' the 'État d'Oraison'?

Rome hesitated. The question had been brought before the Pope, and the Pope was embarrassed between the two prelates who were the glory of the French Church. Fénelon's work was, however, censured in the end; he submitted with the greatest humility and wrote to the Pope: "I shall never be ashamed of being corrected by the successor of Saint Peter. I will never use the shadow of the lightest distinction in order to evade the decree." And what became of Mme. Guyon? She had been an oracle for some time, even at Saint-Cyr, where she had a cousin, Mlle. de la Maisonfort, another enthusiast, who had played the part of *Élise* in Racine's tragedy of "Esther." The whole house had become

quietist; there was no other talk but of pure love, of holy indifference; instead of doing their tasks, the sisters read the works of Mme. Guyon, the 'Moyen court,' the 'Cantique des Cantiques,' the 'Torrents.' The crisis came. Godet, the Bishop of Chartres, saw the danger; he turned Mme. Guyon out of Saint-Cyr. Mme. de Maintenon liked Fénelon, but she was afraid of the King, and Louis XIV. had very practical views and disliked the dreams of quietism. When Fénelon was made Archbishop of Cambrai, Mme. de Maintenon ceased to see him; he disappeared from her life. After his condemnation, Fénelon ceased to see Mme. Guyon; she had continued to dogmatize in Paris after her expulsion from Saint-Cyr. She was put in the hands of Bossuet, in order that he might thoroughly examine her. Bossuet tried to make her change her sentiments, but he tried in vain; however, tired of being a sort of prisoner, she signed a retractation, and thus became free again. No sooner had she recovered her liberty than she began to hold secret meetings and to preach her doctrine. She was again shut up. From Vincennes she was sent to the Bastille. She went through several inquisitions, and she answered all the questions put to her with much reserve and cleverness. By the influence of the Cardinal of Noailles she was again set free, obtained permission to retire to Touraine, and was soon forgotten. "She had lived," says Saint-Simon, "discreetly and obscurely, without making any noise. For eight or ten years she had obtained permission to live in Blois, where she died without any singularity, very devout always, very retired, and often partaking of the sacraments. She had survived her most illustrious protectors and her most intimate friends."

Mme. Guyon will always remain a problematical character. I have dwelt at some length on her, as the chapter, incomplete as it is, which M. Janet devotes to Mme. Guyon's relations with Fénelon, is by far the most original in the volume which he has written on the famous Archbishop of Cambrai. On the whole, M. Janet shows a just sympathy for Fénelon, who in our day has generally been bitterly attacked and sacrificed to Bossuet. Fénelon had what the French call "une belle âme"; he was very human, very ambitious; he considered himself a possible Richelieu or Mazarin; he thought himself fit to govern France. He was disappointed in his ambition, but he bore his fate with much dignity, and he commanded the respect of his enemies.

Correspondence.

THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE.

To the Editor of The Nation:

Sir: In the editorial entitled "Four Thousand Immortals," in your issue of July 7, you say that "international courtesy and the interests of science impel us to furnish the information which Mr. Labouchere desires." Will you kindly advise one who is desirous of resting upon the best authority only, how long it has been since the American people appointed you the custodian of their courtesy in international affairs and the final arbiter in things scientific? I am impelled to ask this question by reason of several inaccurate and misleading statements contained in that editorial, which would seem to indicate that the repository of America's honor and scientific knowledge is not inerrant.

In the first place, the Annals of the American Academy are not, and, as far as I have been able to discover, have never been considered the organ of the University of Pennsylvania. Until recently, one of the associate editors, and, as I am informed, a guiding influence in the management of the Annals, was Prof. Franklin H. Giddings, of Bryn Mawr College and, during the past winter, Lecturer on Sociology in Columbia College.

In the second place, the Academy offers no chromos to its members, only the advantages which accrue from a well-equipped and wisely managed organization of men interested in the advancement of knowledge. In addition to the Annals, six numbers of which are issued a year, the Academy has sent to its members during the last eighteen months an interesting memoir of the late Judge Jameson, and an excellent translation in two parts of Meitzen's standard work on Statistics. These are the kind of chromos, I am persuaded, that are highly acceptable to all members.

It is inaccurate to call the Academy the "Philadelphia Academy," for a careful examination of its 'Hand-Book' shows a large membership in all parts of the Union; in fact, in all parts of the world. To call the organization the Philadelphia Academy would be conferring on that city an honor, an act of which the *Nation* would not be consciously guilty.

I must confess I am not familiar with so-called "touting methods," but, after three years of careful observation, I have failed to see anything on the part of the organization that is not honorable and straightforward.

Very truly yours,
Clinton Rogers Woodruff.

Philadelphia, July 12, 1892.

[We do not admit that any of the statements challenged by Mr. Woodruff are either inaccurate or misleading. We used the expression "Philadelphia Academy" because the official title, "American Academy," is both inaccurate and misleading. The enlistment of members in all parts of the Union does not make a society national when its government is purely local. Really national bodies, like the American Historical Association and the American Economic Association, have governing councils in which the chief centres of scientific activity throughout the country are represented with approximate equality. The so-called American Academy is controlled by a council composed of residents of Philadelphia and its suburbs. The prominent publicists and economists in other parts of the Union who have accepted elections to the Academy are sidetracked in an "advisory committee."

Facts of a similar character justify us in calling the *Annals* an organ of the University of Pennsylvania. In the group of Philadelphia scholars who manage the Academy, the influence of Prof. James and his associates in the University is dominant. Prof. James, as we pointed out, organized the Academy, has been its President since its foundation, and has been editor-in-chief of the *Annals* since their first appearance. To this Mr. Woodruff replies that Prof. Giddings of Bryn Mawr College was for a time an associate editor. We were perfectly aware of this fact, but we fail to see how it affects our statement. Let us ask Mr. Woodruff whether the *Quarterly Journal of Economics*, for example, would cease to be an organ of Harvard University in case a Wellesley professor were for a time taken in as associate editor? In making the statement to which Mr. Woodruff objects, we carefully defined our use of the word "organ"; we said that when "the *control* of the periodical is in the hands of the professors of a single university," the periodical is an organ of that university. We adhere to this definition and to our characterization of the *Annals:* who turns the crank, his is the organ.

We pen this last sentence with some hesitation; for Mr. Woodruff's failure to understand what we meant by "chromos" argues slow apprehension of metaphorical modes of expression. We pointed out that every subscriber to the *Annals* is *ipso facto* a "Member of the American Academy," and we indicated our belief that the rapid growth of the subscription-list was chiefly due to the attractiveness of this title. That the chromo is really prized by the recipients; that they desire to frame it, so to speak, and to hang it on the wall—of this we find homely but competent evidence in the personal-items columns of rural newspapers. We have seen more than once in such sheets the announcement that such and such a fellow-townsman "has been elected a member of the American Academy of Political and Social Science," with accompanying remarks showing appreciation of the honor to the town. We have no desire to dispute the intrinsic worth of the *Annals;* we concede the interesting character of the memoir of Judge Jameson and the excellence of the translation of Meitzen; but a careful examination of these publications leaves us more than doubtful of their capacity to secure 4,000 subscribers in less than three years without the chromo.

Mr. Woodruff appears to think that if our statements are true, the methods of the Academy are dishonorable. We do not think that they merit so harsh an epithet. We do not like to see a scientific body, or a body that claims to be scientific, engaged in sending notices to Tom, Dick, and Harry that they have been severally elected "Members of the American Academy" and are expected to remit five dollars to the Treasurer. We regret the degradation of a title which has served, all over the civilized world, as a recognition of special capacity and definite achievement. We are sorry to see the red ribbon of the scientific Legion of Honor in the market. But all this, we freely concede, is a matter of sentiment; and disregard of such a sentiment by those who do not share it is hardly dishonorable. Perhaps the strongest impression left upon our minds is that of very marked cleverness very much out of place. The construction of an organization which appears to be national and is really under the control of a very few persons in one place, is an admirable piece of practical politics. The seizure and sale of something of purely sentimental value which has not previous-

ly been regarded as merchandise, is commercially a stroke of genius. But the display of such political and commercial talents by those who guard the serene heights of speculative thought, has for us the shock not merely of the unexpected, but of the incongruous.—Ed. Nation.]

NON-VOTERS.

To the Editor of The Nation:

Sir: Permit me to offer a suggestion as to reasons of abstention from voting. To some slight extent, perhaps, pairing-off may diminish the vote: it is easier for Democratic Tom and Republican John to agree not to vote and to spend the day at home than for each to travel to the polls. A threatening development of a third party will not allow pairing.

A more powerful cause of abstention is a certainty as to the result. Examining this subject some thirty-five years ago, I noticed that in 1848 the proportion of voters to the males over twenty-one was about the same in Massachusetts and in Arkansas. I write at a summer resort and without reference-books; I say from memory that in each State the voters were about one-half of the adult males. Contrast the States. One was Northern, the other Southern; one Eastern, the other Western; one an old community, the other recent; one dense in population, the other sparse; one manufacturing, the other agricultural; one under the town system of local government, the other having no unit less than the county; one highly intelligent, with schools, the other then very illiterate; the one a free State, the other a slave State. The notable element of resemblance is the other point of opposition, namely, one was certainly a Whig State, the other a Democratic State. Hence the Democrats of Massachusetts and the Whigs of Arkansas had like motives for indifference and inactivity; they would have motives for voting in those political units of territory only in which they might elect their local officers. The general result was certain in each State. Samuel Willard.

Harbor Springs, Mich., July 14, 1892.

THE POPE AND THE FRENCH GOVERNMENT.

To the Editor of The Nation:

Sir: In the *Nation* of June 16, "G. K." expresses surprise that the Pope's letter to the French cardinals, bidding them accept the present republican form of government, should have called out such editorial comment as appeared in your issue of May 26. "G. K." writes: "Now, Leo has given no other instructions to the French clergy than all his predecessors have done." If there is any difference between the letter and the spirit, there is a very profound difference between what the Pope has just now done and what his predecessors did. The significance of the present Pope's new attitude is not at all in his recognition of a given *form* of government, but in his so daring alliance with modern democracy that "revolutionary" is scarcely too strong a word to apply to his action.

It is doubtful if any modern event has more significance than this bold change which the spirit of the Pope's letter implies. Leroy-Beaulieu, in his articles in the *Revue des Deux Mondes*, expresses this by saying that we have at last "un pape des prolétaires." The only possible classification of popes has been with princes and monarchs. No one will think in future of so classifying Leo XIII. He is as distinctly setting his face toward the Demos as his predecessors turned theirs away from it. The difference between the present Pope and Pius IX. is hardly less than that between Cardinal Manning and the Church official who preceded him. When the leading Catholic economist (Prof. Jannet) wrote, three years ago, "Democracy has triumphed, and our only duty is to recognize the fact," he was severely criticised by Catholics who were fighting for the monarchy. The strain put upon the French cardinals was intense, simply because it was felt that monarchic government had received at the Pope's hand so deadly a blow. This was clearly seen by one of the subtlest of French writers (De Vogüé) as early as 1887. In 1884, a writer in the *Revue des Deux Mondes* could say: "At the risk of making a scandal, we predict a republican evolution within the papacy." The author finds Lamennais's hopeless prayer, "Abandonner les rois pour les peuples," wholly true of the present Pontiff. A Catholic member of the Institute has just said that the real meaning of the Pope's utterance is, "Acceptez le régime populaire et la royauté du suffrage universel; ne vous faites pas scrupule de jouer 'La Marseillaise,' ou de marquer vos maisons du R. F."

Future events must determine whether the Pope has, in all this, shown a "high degree of political wisdom," which "G. K." doubts. It seems, however, very wide of the fact to see in it merely "the old, well-known policy of the Vatican," etc.

John Graham Brooks.

Freiburg, Baden, July 1, 1892.

To the Editor of The Nation:

Sir: Your correspondent "G. K." (No. 1407) has a correct, if incomplete, notion of the drift of papal policy in the relations of the Church with governments which do not recognize its authority and supremacy over all other forms of religion. To those who follow the transactions between the Pope and the French Republic from as near as we are, and step by step, it needs no demonstration that the Pope, in recommending Catholics to accept the Republic, has some ulterior object beyond that of the support of the established Government, for the sake of good government or civil tranquillity. In continual and to a certain extent confidential relations with some of the most liberal of the Roman clergy, I have abundant opportunity to form an opinion which is perhaps as clear and safe as an outsider can obtain, and I have heard from some of the most candid and right-minded of my Catholic friends their own opinion, that the dominant, not to say the sole, motive of Leo XIII., in urging with such vigor and persistence the frank and entire submission of the Catholics of France to the present republican régime, is simply the expectation that the Republic will, when the collision between France and Italy which looms in a remote, it may be, but very certain future, comes, recompense the Papacy by the restoration of Rome to the head of the Church.

I do not think that any well-informed Catholic in Rome, or who has much to do with Rome, has any doubt that this is the fact, and I have heard some of the best and most devoted friends of the Pontiff lament that he is sacrificing the influence of the Church in Italy, and risking a schism in France, for the phantom of a temporal power which has always been a mockery, for it has only changed the protection of the Papacy from one shoulder to another; the demonstration of the absolute dependence of the ecclesiastical Government on an outside military force having long ago been made *ad nauseam*. The present Ministry of the Republic may inwardly repudiate the intention sincerely, but it has never dared openly and officially to say to the Pope, "We refuse to entertain and encourage the project of restoring Rome to the rule of the Church." To do so would put an end at once to the pressure of the Pope on French Catholics to rally to the Republic, but it would put an end also to the assurance of the moral aid of the Church being given to France when the great European war comes on for which France is arming and concentrating her strength. The question is already very earnestly debated among serious Catholics who recognize that the interests of their religion are not at stake in the present dispensation in Italy, and that the attitude of the official Church is preparing an immense apostasy when the step is taken for which the Pope is preparing. A considerable element of the French Church consider that the Pope is asking them to sacrifice their profoundest political convictions to the feud with Italy and the hope of the temporal rule, in which they have no interest whatever; and in France, but much more in Italy, the division among Catholics caused by this policy is already very pronounced.

The part of the clergy which most cordially detests modern reforms, *i. e.*, the ultra-conservative Italian members of the hierarchy, and the entire body of the Jesuits, under whose influence the present Pope has been almost since he became Pope, are favorable to carrying on the war with Italy to the bitter end. The liberal element (which is not lacking) deprecates the present state of hostilities; but as no ecclesiastic dares openly revolt against the dictum of his Holiness, even when it is not a question of dogma, the opposition is silent. A friend of Cardinal Lavigerie, to whom the policy of that Eminence is familiar, said to me that the meaning of his programme was simply the conversion of Catholics into supporters of the Republic, and the legal instalment of good Catholics in the Government instead of the atheists and Freemasons who now control it —or, as he expressed it, "getting possession of the Republic, after which it is easy to make it what we like." The basis for this electoral operation is the indisputable fact that the large majority of the voters of France is with the agricultural population, almost without an exception under the absolute influence of the clergy; and if these could be united intelligently, there is no question that they would return a Chamber of Deputies ready for what the Church may demand, *i. e.*, the abolition of the military service for the clergy, the restoration of the schools and hospitals to the confraternities, and the abolition of all laws which favor Protestants and heretics politically.

Fortunately, priests make very bad politicians, and the organization which should bring this majority into power has never been formed, owing to the divisions among the French Catholics and the antagonisms of the parties, which hope each to use the Church for its own restoration to power. The extent of the wisdom of the Pope is in seeing that these divisions are irreconcilable, and that if the Church is to rule France, it must do so through the Republic, as the present rulers are doing; but he would, if practicable, gladly do so through the monarchy. Nobody doubts that a considerable number of French Royalist Catholics are satisfied that the Pope is sacrificing

their convictions and hopes to his temporal ambitions. I have the most satisfactory proof; but they are helpless, for religion and royalty are so united with them that they cannot rebel against the only basis for the divine right of kings. If, therefore, the Republic as at present regulated should finally decline to restore to the Pope his temporal power, the chance remains that the converted Republic may; and a Catholic Republic in France, as the guardian of the rights of the Church, is even better than an absolute sovereign in the same place. These are the reasons why the Pope is republican in France.

These things are the open secrets of Rome—rarely publicly admitted, often *pro forma* denied, but never honestly disputed by any one in the ecclesiastical sphere, and, to my personal knowledge, over and over again asserted by those who have access to the best sources of information in the Vatican. I have the best reason to say that even in the College of Cardinals there is a great deal of difference of opinion as to the soundness of the policy of Leo XIII., and these differences of opinion will have a great deal to do with the election of the next Pope, and possibly with the relations of the Papacy to the French Republic; and the ecclesiastical world in this part of Europe is by no means satisfied of the Pope's worldly wisdom. Judged by the results to be looked for, without any spiritual illumination, it seems to some of us, lookers on, to be doomed to a dilemma of disaster. The alliance with France as against the Triple Alliance, "three against three," makes the Papacy sharer in the victory, but also in the defeat. Now the victory means the division of Europe between Orthodox Russia and the present form of Republic in France, the dissolution of Italy and of Germany as an Empire, the utter prostration of Catholic Austria, and the extension of Russian control and the Orthodox religion over the entire Slavonic country, including Constantinople, and eventually the Holy Land; and, as reflex consequence, the revolt of patriotic German and Italian Catholics from Rome—in short, a series of disasters to the real Church of Rome, which has no political existence and can depend on no government. The other alternative of a defeat in this European struggle means the humiliation of the Papacy, confirmation of its expulsion from Rome, the prostration of France, the Church's eldest daughter and only political protector, and, when the heat of the conflict has passed, the grave demonstration of a moral blunder and the humiliation of a defeat due to want even of common worldly wisdom; the most flagrant impeachment of Papal infallibility or divine guidance, which still remains to its advantage in the common mind of the masses of the Catholic populations. Of the two horns of the dilemma, victory will gore the Church most deeply. But to one or the other of these alternatives the present policy of Leo XIII. dooms him. That there are wise and earnest Catholic churchmen who see these possibilities, my ears are witness; they are not concoctions of a heretic brain, for I hear them discussed by good Catholics in the once papal city.

X.

Rome, June 30, 1892.

THE RACE OF THE LANGUAGES IN EGYPT.

To the Editor of The Nation:

Sir: You may be interested to know that a unique competition is in progress in old Egypt, and that the study of the English language in the schools is more and more sought by the scholars in the studies of election. English is now taught in thirty-seven out of a total of forty-four schools; and though there are only five schools where the official languages are Arabic and English, compared to sixteen schools where boys are taught in Arabic and French, there are now a score of schools where there are French and English masters in addition to the native teachers. At the age of nine, boys can practically decide whether they will learn French or English. French has been the chief foreign language ever since the First Napoleon's time, and most Egyptians of consequence are familiar with it; and but few, till quite recently, knew English. In fact, Egypt has virtually been intellectually occupied by France. But a change seems to be imminent, and ere long the relative positions of these two speeches may be reversed, in spite of the efforts of the society in France formed with the object of propagating French thought and literature in Egypt, and which watches the English propaganda with anxiously jealous eyes.

This society has, however, confined itself principally to the Copts, for the reason that from among this people spring most of the commercial class. A year or so ago, some fifty Englishmen in Egypt subscribed a fund of nearly nine hundred dollars for the purpose of offering prizes to the boys in the Government schools, including the Medical College in Cairo. The idea took so well that 1,312 pupils this year competed, from 23 Government schools in the country, for 123 prizes; a prize or two being offered to every class learning English. In some cases the examination was very severe, and it is stated that 1,074 candidates gained more than half-marks, while 533 of them actually obtained 75 per cent. The credit of this work and the rapidly accruing results, so much commented and exulted upon by English journals, are mainly due to the efforts of the recently brought-out staff of English teachers, who are doing their utmost to make the language popular. Probably the material prosperity of the country following in the wake of the British control, and the disappearance of the brutal taxgatherers of former régimes, are more or less connected with the progress and popularity of the work. There is no difficulty on the part of the students, but the movement has unfortunately aroused the active jealousy of the French, who do not seem to understand that there is nothing to prevent their offering similar prizes for proficiency in their own language.

It has long been said that the lowly Egyptian was incapable of change or rapid mental improvement such as is now actually going on. That this people can be formed into fairly good fighting material, as demonstrated by recent trials, is another shock to the upholders of the old order of things. All this signifies that ordinary humanity, wherever found, is readily impressible to the higher impulses, and that old Egypt still retains the germs of a better civilization than has been vouchsafed her these last nine centuries. C. A. Siegfried.

Newport, R. I.

MURAL DECORATION OF EGYPTIAN TOMBS.

To the Editor of The Nation:

Sir: An artist friend, failing to find, after long and earnest search in a large reference library, any answer to the question which had suggested itself to him, of how the ancient Egyptian artists secured light to execute their mural paintings in dark tombs, applied to Mr. H. Villiers Stuart, author of 'Nile Gleanings,' with the result enclosed. Perhaps others may be interested in the question also. X.

Madison, Wis., July 8, 1892.

Dear Sir: I have just had the pleasure to receive your letter of May 12. You ask, "By what light did the ancient Egyptian artists execute the wall paintings in their lightless, rock-hewn tombs?" The same question has often occurred to me. Of course they were executed by artificial light, but the only appliances for artificial light that have been discovered are terra-cotta oil lamps of small size. These were fed with olive oil, and yielded each much the same volume of light as the modern wax candle. I have often picked up broken specimens of such lamps in the tombs. By this dim light they managed to sculpture the bas-reliefs and also to color them.

In the tombs of the kings, not only are acres of wall covered with minutely detailed paintings, but the ceilings also. It must have been ruinous to the artists' eyes as well as most laborious. But kings and feudal nobles gave the command, and their slaves had to find means to carry out their masters' commands, or woe be to them. Such temples as Abou Simbel, and such tombs as those of the Kings, penetrate the very bowels of the mountains, and were of course absolutely lightless.

Yours very truly,
H. Villiers Stuart of Dromana.

16 Queen's Gate, South Kensington, S. W., London, June 1, 1892.

Notes.

The valuable compilation, by Mr. Paul Leicester Ford, of 'Pamphlets on the Constitution of the United States Published during its Discussion by the People,' is to be followed by a companion volume of 'Essays on the Constitution,' published at the same period. Among the better known of the essayists are James Sullivan, Elbridge Gerry, Oliver Ellsworth, Roger Sherman, George Clinton, Alexander Hamilton, Hugh Williamson, and Charles Pinckney. Their medium was the public press of the several States. Mr. Ford's address is 97 Clark Street, Brooklyn, N.Y. We take this opportunity to notice his reprint, from the Boston Public Library's Bulletin, of his own "Some Materials for a Bibliography of the Official Publications of the Continental Congress, 1774-1789." It makes a handsome volume with a page in double columns, of which one is blank, to admit of insertions.

D. Appleton & Co. announce 'An Englishman in Paris,' consisting of personal reminiscences during the reigns of Louis Philippe and Louis Napoleon. These have a distinct literary flavor.

Ginn & Co. have in press Hugo's 'Les Misérables,' condensed and edited for school use by Prof. F. C. de Sumichrast of Harvard; and a 'German Grammar for High Schools and Colleges,' by Prof. George Hempl of the University of Michigan.

The publishers of *Puck* announce that within the present year they will issue a limited edition (to be sold by subscription only) of 'Cartoons from *Puck*,' by Joseph Keppler, "being a choice selection of the most noteworthy of Mr. Keppler's cartoons that have appeared in *Puck* from 1877 to 1892." Mr. H. C. Bunner will provide explanatory and historical notes. Keppler & Schwartzmann will also issue Mr. Bunner's humorous story, 'The Runaway Browns,' now appearing weekly in *Puck*, as soon as it is concluded in that publication.

A. R. Keller Co., Philadelphia, correct ou statement that their newly published Life of Mr. Blaine was meant to be a campaign bio-

graphy. "We made arrangements," they say, "to issue this work as far back as February, when no one supposed, in face of the letter Mr. Blaine had written to Chairman Clarkson, that there was any possibility of his being a candidate, or that his name would even be mentioned in the Convention."

Two years ago an edition of the 'Speeches and Public Addresses of the Right Hon. W. E. Gladstone, M. P.,' was undertaken, with his consent and with his assistance for the knotty places, by A. W. Hutton and H. J. Cohen. Methuen & Co., London, have just issued the tenth and concluding volume of this selection from the utterances of sixty years. It covers the years 1888-1891, and its contents illustrate very happily the many-sidedness of this statesman's mind. The Irish Question, in various phases, is a frequent theme. The Disestablishment of the Church of Scotland was the subject of approbatory remarks in the House on April 24, 1890, and Mr. Gladstone has just felt at the polls the ecclesiastical resentment caused by his support of that measure; and not unexpectedly, for, being menaced with it, he said: "I shall be most happy to answer to the electors of Mid Lothian for my conduct" in respect to a certain protest from that quarter against Disestablishment. Mr. Gladstone also spoke at the Eisteddfod, at Wrexham, Wales, in 1888; on the State of Agriculture in England, at the Hawarden Flower Show, in the same year; on the Workman and his Opportunities, in 1889; on Free Trade and the McKinley Act, in 1890; on the Channel Tunnel—most sensibly—in 1888; on the Homeric Artemis, at Eton, in 1891; and on the Future of the Liberal Party, in Newcastle (whose electors have just disappointed him), in 1891. We may also mention his obituary tribute to John Bright in the House, in 1889—generous, if not specially felicitous; and a short speech in French in Paris, in 1889. There is a frontispiece portrait of the orator, who has already gone far towards supplying material for an eleventh volume.

Jack Ketch and Captain Kidd are among the disreputable personages who figure in the thirty-first volume of the 'Dictionary of National Biography' (Macmillan). A light reputation might also be predicated of Pepys' flame, Mrs. Knipp. John Knox has the honor of the longest article—twenty pages. Eight are given to Charles Kingsley, whose sympathetic biographer is Leslie Stephen, with praise for his "first-hand descriptions of the nature that he loved" as unsurpassed, and for his "Andromeda" as "perhaps the best example of the English hexameter." Mr. Stephen, who does not generally blink things, and deals impartially with the Newman controversy, passes over Kingsley's heated defence of Gov. Eyre for his Jamaica hangings. Mr. Stephen also contributes the brief notice of Kinglake, the historian. Canon Ainger of right tells the story of Charles Lamb in some six pages. The publisher and Shaksperian editor Charles Knight receives honorable mention. To his inventiveness as a journalist we owe perhaps the first instance of the practice of summarizing articles in the magazines, and the device of "patent insides" for country papers. Mr. W. H. G. Kingston, the writer of juvenile novels, fills less than a page of this Dictionary; but the list of his works requires nine and a half pages in the Catalogue of the British Museum, we are told.

Mr. W. M. Griswold's original guide-book called 'Travel,' published by the author at Cambridge, Mass., has attained to No. 107 in its series of carefully selected, sometimes abridged, and generally annotated descriptions of visits to sundry European places. One volume, bearing the name 'Travel,' is a miscellaneous assortment, but others are formed out of related groups and labelled 'France,' 'Germany,' 'Switzerland,' and have a very practical utility for all intending visitors to those countries. Each description has its number. Thus, the Rev. Harry Jones's "Interlaken to Aosta" is No. 106, and in the course of it there is mention of the Wengern Alp, whereupon Mr. Griswold claps on the number 15 in superior figures to show that by turning to No. 15 we shall learn all about that alp. Moreover, Mr. Griswold contrives to maintain his phonetic propaganda, printing, "hī snōs," "ōnce," "thēy," "chief," "brōt," "twilit," "ēarlier," and other diacritic novelties. Finally, each volume has an index to the whole 107 pieces.

The annual revision of 'Appletons' General Guide to the United States and Canada' has been much more extensive than usual for the current volume for 1892, which has been enlarged by forty pages, and has suffered a minute overhauling. As might be expected, Chicago furnishes a good example of changes having special reference to the coming World's Fair. With new maps there are also new illustrations, the discarded ones, however, being sometimes missed, as in the case of Boston, and the style of production being too heterogeneous. The Appletons have also brought out Part II. of their "Canadian Guide-book," uniform with Prof. Roberts's 'Eastern Canada and Newfoundland.' Mr. Ernest Ingersoll is the compiler of 'Western Canada,' and betrays his customary skill as a writer and book-maker. The guide-book possesses a high quality from a literary point of view, and is well illustrated.

The late J. J. Weiss, one of the most brilliant of the *normaliens*, although not as prominent as About and Prévost-Paradol, as M. Taine and M. Sarcey, was for a while the dramatic critic of the *Débats*, writing the regular weekly article every Monday. Under the general title of "Trois Années de Théâtre," four volumes of these articles are to be published, of which the first has just appeared, 'Autour de la Comédie-Française' (Paris: Lévy; New York: F. W. Christern). The best pages of this are devoted to a comparison of Molière and Plautus, an analysis of Émile Augier, and a eulogy of Regnard. The other volumes are to be called 'À propos de Théâtre,' 'Le Drame Historique et le Drame Passionel,' and 'Les Théâtres Parisiens.'

On the 7th of June the seal of the University of Oxford was affixed in Convocation to an indenture of agreement with Mr. Charles Drury Fortnum. Mr. Fortnum agrees (1) to add the remainder of his valuable collections to those portions of them already in Ashmole's Museum, and with them to give his library; (2) to give £10,000 subject to the payment of an annuity during his life, but otherwise to be used under the name of "The Fortnum Trust Fund" for the increase of the Ashmolean Museum and of the salary of its keeper. The University agrees (1) to assume certain pecuniary responsibilities in the administration of "The Fortnum Trust Fund," and (2) to expend £15,000 upon building an extension of the University Galleries, to be called "The Ashmolean Museum," and to house the old collections of Tradescant and Ashmole as well as those of Mr. Fortnum, together with everything now contained in Ashmole's ancient building. This vacated space, being contiguous to the Bodleian Library, is to be handed over to Bodley's Librarian. The more modern Randolph and Taylor buildings, a part of which is known as "The University Galleries," taken together with the new Ashmolean, will form a Museum of Art and Archæology worthy of the marked revival of those studies which began under Ruskin and is in progress under Professors Herkomer and Gardner. It is thought that no Oxford benefaction since the gift of the Douce collections has been equal in importance to this of Mr. Fortnum, seconded as it is by a considerable pecuniary sacrifice on the part of the University.

The approaching sale of the unrivalled "Lord Spencer's" Library—*en bloc* if a purchaser can be found—has prompted the New York house of Mitchell's to propose a syndicate of American book-collectors for that purpose, "the books to be brought to New York and put up for auction either among the members of the syndicate or to the public."

The Danish Statistical Bureau recently published a monograph containing interesting comparisons of the increase in population in the different parts of Denmark during the years 1801, 1840, 1860, 1880, and 1890. From this it appears that since the beginning of the century Copenhagen has grown from 100,975 to 312,859. The greatest increase has been since 1860, when the population more than doubled. In 1801, the second largest town was Odense, with 5,782 inhabitants. In 1880 it was outstripped by Aarhus, which at present has a little over 33,000. Since 1860 Aarhus has more than trebled. The smallest towns in Denmark are Mariager and Aarkirkeby, which have grown from 414 and 455 respectively to 761 and 957. The greatest growth is that of Frederiksberg, a suburb of Copenhagen. It has risen from 1,172 to 46,954—a growth similar both in cause and extent to that of the upper part of New York city.

The newly published Proceedings of the New Jersey Historical Society for 1891 contains a sketch of a former Democratic Senator from that State, Mahlon Dickerson, with extracts from autograph letters. One of these, to Lewis Cass (November 19, 1840), after the election of Harrison, comments on the mistaken Democratic attempt to force down the Sub-Treasury Bill at an extra session. "Those who deserted our ranks were considered as Federalists, not worthy of our attention, and the system of proscription was followed up with greater vigor than ever, in order that the party might be made *perfectly pure. It is indeed made very pure, but inconveniently small.*" We used, amid the early proscription of Mugwumps, to make precisely the same observation to our friends the Republicans—as our files will bear witness. Mr. Dickerson, a firm protectionist, favored "a perfectly reciprocal commerce—not with one nation, but with all nations—and that by legislation, not by negotiation. . . . The House of Representatives of the people should never submit to any infringement of their constitutional powers to regulate commerce."

The *Civil-Service Record* of Boston and the *Civil-Service Reformer* of Baltimore have wisely been consolidated under a title which implies permanence, *Good Government*. It will be edited in Washington, and issued simultaneously in that city and in New York. Mr. F. E. Leupp of Washington, a journalist of large experience and entire sympathy with the cause, will conduct the new journal, which will receive the cordial support of the leaders of the civil-service-reform movement.

Two or three years ago a French critic mildly complained of the enormous crop of memoirs and letters that the centenary of the Revolution had brought out. He could not go into the country for a Sunday, he said, without finding on his table when he came back half-

a-dozen new volumes of them pressing for notice. The harvest seems even now to be far from its end. Among the more recent additions to it the souvenirs of M. de Viel-Castel are noteworthy. These are appearing in a rather fragmentary sort of way in the *Correspondance*, under the care of the Duc de Broglie. The latest portion published relates to the year 1818, when M. de Viel-Castel had just entered as an attaché the depot of the Archives of the Ministry of Foreign Affairs. The director of the depot was then the Comte d'Hauterive, of whose pernicious revolutionary activity in the United States Washington had at an earlier day complained to the Committee of Public Safety. Viel-Castel gives a somewhat minute and life-like portrait of this worthy, which will be of a certain interest to students of American history. There are also in the picture some extremely pretty touches of observation which make a wider appeal.

—In the *Bookman* for July, the anonymous writer of the striking series of papers on "The Carlyles and a Segment of their Circle" arrives at Emerson's second visit, and gives us some lifelike traits of both guest and host. "Carlyle, still full of Cromwell, resented with needless heat Emerson's refusal to fall down and worship the Puritan hero"; and the American, on his part, said that "Carlyle's heart is as large as the world, but he is growing morbid." He was most impressed by Carlyle's conversation, which he compared to sculpture, and thought more marvellous than his books. Going to breakfast with the writer of these "Recollections," Emerson took along photographs of his wife and children, saying apropos of the former: "If any of our family are saved, it will be through her merits." Referring to Carlyle's hot denunciations of authorship, Emerson said: "If Mr. Carlyle can show me any better employment than literature, I shall be happy to betake myself to it." Emerson gave a dinner-party to his Manchester friends before quitting that city, at which were present some from northern and midland counties with whom he had long corresponded on high matters—"a strange collection of mystics, poets, prose-rhapsodists, editors, schoolmasters, ex-Unitarian ministers, and cultivated manufacturers." One of the guests, a vegetarian, found a dinner of herbs considerately prepared for his special consumption. "After the prandial and post-prandial babblement, our host gave a serene close to the evening by reading to us his lecture on Plato." In the brilliant London society where Emerson found all doors open to him, he appears to have sat for the most part, as he did at those gatherings made memorable by Lowell, "Listening with eyes averse." Indeed, so abashed was he at the thought of giving lectures in London that his friends had to resort to the innocent ruse of getting up a formal request to him, signed by several notabilities, in order to force him to the platform. The original of this memorial has lately been turned up in Forster's papers. After the first lecture, Carlyle sallied forth to Emerson's quarters on a visit of congratulation, but was able to deliver himself of no other compliment than that the lecture was "very Emersonian." "Moonshine," it will be remembered, he called it in private. However, before Emerson left England, Carlyle spoke of his lectures as "intellectual sonatas," and said that he was "a beautiful figure among those talking Yankees," and the ideal of an American gentleman.

—The paper closes with a hitherto unnoticed memorial of his intimacy with Emerson, in the shape of an article on "Indian Meal," published in *Fraser's Magazine* for May, 1849, and signed "C." Carlyle wished, like Cobbett, to see Indian corn introduced in those days of potato-disease, and got Lord Ashburton to have Emerson's sample ground by his own millers and prepared by his own French cook. Of the result thus reached, Carlyle declared that it was meal "sweet among the sweetest, fit for the cook's art under all manner of conditions," on which a grown man could be "supported wholesomely, and even agreeably, at the rate of little more than a penny a day." On the strength of these good tidings, he bade "the disconsolate Malthusian fling his 'geometrical series' into the corner, assist wisely in the Free-Trade movement, and dry up his tears." There is no doubt that the article is Carlyle's, though not included in any edition of his writings; he told the writer in the *Bookman* that he had sent the article in the first instance to the *Times*, but that the editor returned it.

—We announced, not long ago, the impending publication of a great number of Rousseau's unpublished letters, enough to make a very considerable volume, which has now appeared in Paris, thanks to M. Henri de Rothschild, who procured the curious collection, and to M. Léo Claretie, who very agreeably introduces it to the public. It consists of a correspondence, running through the years between 1762 and 1773, between Jean-Jacques and Mme. Boy de La Tour, who was one of his most faithful friends and benefactors. She was in the way of performing for him all sorts of small commissions at Lyons, and it is to these errands that Rousseau's letters almost exclusively relate. They have no literary interest or value whatsoever. But, for the modern biographer, and perhaps also for the modern reader, they will be of interest, for Rousseau was extremely minute and circumstantial in giving his commissions, and one can easily reconstruct him out of them in his habit as he lived. Ample information is furnished as to what he ate and drank, and how he dressed, and of what shape his nightcaps were, and how he warmed his room, and what sort of candles he burned. Prices, too, of all sorts of things, some of them hopelessly out of fashion now, are carefully set down. One can find what barracan was by the yard in the years just before our Revolution, and camlet, and taffeta, and many another stuff. None of this new information, as will be seen, is of high importance, but it has its own humble place. Many will value it more highly than M. Émile Faguet does, who notices the book in the *Revue Bleue*. He calls it an "interview of Jean-Jacques by Rousseau," and lets it go at that.

—"One must be a barbarian not to know the name of Nicolò Bettoni," said Victor Cousin in 1832, on being introduced to this Italian publisher, whose imprint was, in fact, bestowed on five million volumes, and whose active career in this capacity covered the thirty years from 1806 to 1836. He was a writer, too, of many things besides prospectuses; and though not of the first rank as a stylist, he was a sufficiently weighty polemic, and in common discourse he was extremely plausible and persuasive. For half a century he was notorious both in Italy and in France, where he ended his days in wretchedness; but his name has now quite slipped out of the biographical dictionaries. It has been the pious work of Signor Piero Barbèra, the present head of the well-known Florentine house, to revive the memory of his fellow-countryman and publisher, as he had already done in the 'Ricordi biografici di Vincenzo Batelli, tipografo fiorentino,' and the 'Ricordi biografici di David Passigli, tipografo-editore.' He has accordingly produced a charming sketch of one hundred pages, entitled, 'Nicolò Bettoni: Avventure di un editore' (Florence: Barbèra), followed by bibliographical lists of Bettoni's writings and publications. This restless and speculative genius was the founder of five printing establishments, and conducted four at one time—in Brescia, Padua, Milan, and Portogruaro, his birthplace. He gave a great development to the popular subscription "Library"—of classical authors, of Italian writers, of international masterpieces, of iconography, etc.—and invented the scheme of increasing his subscribers by promises of prize drawings if the number exceeded a certain figure or figures. This brought him into trouble in France, where he sought to introduce a method frowned upon by the native publishers. While not a master of the details of the printing business, preferring the rôle of general manager and over-sanguine *impresario*, he was nevertheless a precursor of the rotary press, having invented a cylinder for giving the requisite impression to forms moved forwards and backwards on a horizontal carriage. He was apt to overestimate the public reception of his enterprises, but he suffered his greatest losses from the unfaithfulness of his employees. The most salient episode in the story is the quarrel with Ugo Foscolo, which is candidly set forth by Signor Barbèra with great impartiality and delicacy. Like Foscolo, Bettoni was of the circle of the Countess Teotochi Albrizzi ("cara Isabella"), of whom our Italian correspondent discoursed lately in these columns.

—To those whose memory goes back twenty or thirty years it is interesting to note the rapid multiplication of the means of illustrating classical study in the school-room. For the few poor woodcuts that were supposed to adorn the school-books of a former generation, we have a profusion of reproductions—sometimes of the highest order of excellence—and the office of the picture, the engraving, is everywhere recognized. Twenty years ago, to give a practical instance, a primer was projected which should show under *equus* a horse as the Romans saw him, under *aratrum* a plough as the Italians used it; but the project was rejected by the publishers as fanciful. Now Comenius and the 'Orbis Pictus' have come to their rights again, and there is no end of illustrated school-books of Greek and Latin. And yet this does not satisfy the pedagogic soul, and the other day an Austrian teacher complained that the map or atlas form of illustration was too cumbrous and too costly for the average school-boy, and advised his fellow-teachers to do as he had done, and to make a collection of the illustrations sent out at Christmas and New Year in publishers' sample-sheets. It seems that in an incredibly short time the experimenter had brought together hundreds of admirable illustrations, which, pasted on stiff cardboard, could circulate freely from hand to hand; and they cost nothing. Doubtless we are on the eve of the leaflet system as applied to illustration, perhaps are in the thick of it. Meantime, it is our business to welcome the American edition of Engelmann and Anderson's 'Pictorial Atlas to Homer,' published by B. Westermann & Co.—one of those international enterprises with which Kiepert's atlases have made us familiar. By changing the letter-press to suit

the locality, the same illustrations may be made to serve the whole world of schoolboys; and the curious investigator of the next century may well ask the question whether this community of text-books has not contributed powerfully to the levelling of the nations. As each nationality has its pet verses of Scripture, so each nationality might well be supposed to dwell with favor on some special side or scene of a universal classic such as Homer; and it is evident that if this thing goes on, we shall all be forced into the common German mould.

—Still, we must not grumble at so good a thing as Engelmann and Anderson's 'Pictorial Atlas.' The value of the work is incontestable, and the plan worthy of all acceptance; although, as the chief editor anticipates, some scholars may think that the scheme of giving un-Homeric details of Homeric myths in the interest of mythological study is a stretch of the proper purpose of the book, which is, after all, to show what a hold Homer had on antique civilization. Of course it does not undertake to illustrate the Homeric world as the Homeric singer saw it. That could not be done, even if we had more remains of the period than we have, for the poet's eyes had a light that does not come from Assyrian or Egyptian art. But we are sorry to note that an evil fate seems to have presided over the transfer of the German letter-press to English. "Herald" appears unchanged as "herold"; our old friends the enemies of the Pygmies are changed from "cranes" to "storks"; and in trying to identify the Pygmies we find ourselves introduced to a lot of "niggers" who look unconventional in this undress. "Labor" is represented by "travail pain"; the "Laestrygonians" are syncopated into "Laestrygians"; and in the Greek text there is a liberal sprinkling of false accents. But, for all that, the book is a welcome addition to our school-apparatus for Homer, and may be cordially recommended.

—Schmeltz's *Internationales Archiv für Ethnographie* (Leyden, Band V., Heft I.) contains an exceedingly interesting and exhaustive article of nearly twenty pages "On Ancient Mexican Shields," by Zelia Nuttall, with three plates of more than sixty colored illustrations. Mrs. Nuttall is recognized by scholars in both hemispheres as an authority in this branch of research, and has honestly attained this high position by the thoroughness of her philological and archæological equipment and the remarkable acuteness and conscientiousness of her investigations. The same qualities which characterized her former monographs, "Standard or Head-dress? An Historical Essay on a Relic of Ancient Mexico," and "The Atlatl or Spear-thrower of the Ancient Mexicans," distinguish also in an eminent degree the paper now before us. It is a careful and comprehensive study based upon original sources, comprising early chronicles, old inventories of gifts sent by the Spanish conquerors to Charles V. and other personages, specimens of native Mexican art in ethnographical museums, and a dozen codices, and not only constitutes a valuable contribution to the special subject discussed, but also throws welcome light on portions of the still obscure and imperfectly explored province of Aztec civilization. The author begins with war-shields, of which there was a great variety according to different grades of the service. As the Aztecs waged wars chiefly for the purpose of procuring human victims for sacrifice, the aim of the soldier was not to kill, but to capture as many of the enemy as possible, and it was for such bloodless deeds of valor that he was most sure of rapid promotion. He entered the army, so to speak, as a blank sheet, on which he was to inscribe in hieroglyphic colors and characters the history of his military career. "His face and body were unpainted, his clothing was plain white, and his shield was a simple one of interwoven strips of bamboo cane"; but with every batch of prisoners he brought in, he was permitted to add some new ornament to his costume and to stain his skin with some bright pigment, until he became a gaudily painted warrior, with gorgeous shield, golden nose-crescent (*yacametze*), and other conspicuous insignia of exalted rank. Mention is also made of an oblong shield, which covered its bearer from head to foot, but which, when he was obliged to run, he could roll up and carry under his arm like an umbrella or a water-proof cloak.

—It was, however, the second class of shields, designed only for display at religious feasts and dances and on other gala days, on which the Aztec lavished his greatest artistic skill and barbaric wealth of decoration. Nearly all the shields sent by Cortez to Charles V. as "gifts to be distributed to churches, monasteries, and private individuals," were of this kind. The majority of them have doubtless perished and are known to us only from brief descriptions recorded in Spanish inventories or from pictorial representations in ancient Mexican manuscripts in which they are borne by various deities. A most interesting relic of this sort was recently discovered by Mrs. Nuttall at Ambras Castle, near Innsbruck, and recognized by her as identical with the "shield of red feathers, on its field a blue dragon of coarse mosaic work, garnished with gold-leaf," described in the inventory of 1596. This shield has been at Ambras for more than three centuries, and is in a marvellous state of preservation. "The feathers of which the mosaic work is composed are still fresh in color and have escaped the ravages of moths. Only a few pieces of the gold ornamentation are missing." Another interesting discovery recently made by Mrs. Nuttall we have already reported, viz., an ancient Mexican manuscript preserved in the Biblioteca Nazionale of Florence under the Spanish title: 'Libro de la vida que los Yndios antiguamente hazian, y supersticiones y malos ritos que tenian y guardavan,' rich in colored designs which serve to illustrate the text and are exceedingly valuable from an artistic point of view. Mrs. Nuttall is now having this entire codex photographically and chromolithographically reproduced in facsimile and will publish it at her own expense, with notes and introduction and an English translation of the text. The edition of this unique work will be limited to 200 copies, which may be purchased from the Peabody Museum of American Archæology and Ethnology, Harvard University. We may add that Mrs. Nuttall has been appointed Honorary Special Assistant in charge of the Mexican Department at the Chicago Exposition, and that she is having made for this department copies of some of the most important ancient Mexican manuscripts and antiquities now existing in European libraries and museums.

CONWAY'S PAINE.

The Life of Thomas Paine, with a History of his Literary, Political, and Religious Career in America, France, and England. By Moncure Daniel Conway. To which is added a sketch of Paine by William Cobbett, hitherto unpublished. G. P. Putnam's Sons. 1892. 2 vols, 8vo.

It is a remarkable fact that Mr. Conway's Life of Paine is the first biography of the famous heretic worthy to be so called. The attempts of Cheetham and "Oldys" and Rickman were mere sketches—the two former worthless because of their malicious enmity; the last th testimony of a faithful friend, but devoid of any literary merit and of any critical temper or research. Meantime, Paine has been equally the victim of such fulsome eulogy as that of Col. Ingersoll and the most ignorant depreciation. Even the gentlemen and scholars from whom something different was to be expected have allowed themselves to go with the prevailing falsehoods and to better their instructions, as where Mr. McMaster, in his first volume, anticipates by ten years Paine's theological reputation, and attributes to it the disfavor shown his economical opinions; and Mr. Roosevelt, in his Life of Gouverneur Morris, calls Paine a "filthy little atheist," when five minutes' reading in the 'Age of Reason' would have informed him that Paine was as little of an atheist as any one in the wide range of notoriety, even the most orthodox. With such things possible it was high time that Paine should have a good biographer, one who would extenuate nothing, nor set down aught in malice, but present the man in physical and intellectual and moral habit as he was. If Mr. Conway has not done this in each particular, it is evidently from no lack of generosity in his disposition. It is very certain that he has set down naught in malice; that he has extenuated nothing, some, if not many, of his readers will be less confident. His investigation may have been judicial, but there is too much of advocacy in the manner of his book to produce the best effect on those who will come to it with a prejudice against Paine or in his favor. The latter would be more readily confirmed in their opinion by a more studious appearance of impartiality, and the former would yield something of their prejudice to such an appearance which they will probably withhold from Mr. Conway's steady stream of adulation,

> "Shining on, shining on, by no shadow made tender."

If this indication is too absolute, the only deduction to be made from it is with reference to Paine's personal habits. Cheetham, a miserable partisan journalist, charged Paine with gross intemperance, with licentiousness, and with extreme contempt for the proverbial belief that cleanliness is next to godliness. These charges have had the widest currency, and Mr. Conway has felt it incumbent on him to investigate them thoroughly, and in the main he has succeeded in refuting them.

> "Still to be neat, still to be dressed
> As you were going to a feast,"

was not felt to be necessary a century ago so generally as now. The republican and literary affectation was in the opposite direction. Paine would seem to have been so much tidier than Dr. Johnson, whose "clean-shirt days" were epochs for his friends, as to have been always careful in his dress and toilet; if not in his extreme old age and poverty and broken health, it were cruel to say much of this. Add to those disabilities neglect and wounded vanity and a broken heart, and if he had been as hard a drinker as the Long Island parsons opposite his farm at New Rochelle, it would have been more pitiful than strange. But, though the reports and rumors are conflicting, and it is not easy to strike the balance with complete assurance, Mr. Conway's

judgment that Paine's temperance was exceptional for his time seems sound enough. That there was a time, in 1793, after the arrest of the Girondins, of whose party Paine had been, and before his own imprisonment, when he took to brandy violently, in order to "forget his sorrows, and remember his miseries no more," Mr. Conway makes no denial. Whether his argument for the limitation of the term of this excess is accepted or rejected will depend a good deal on the theology of his reader. It is that no besotted person could have written the 'Age of Reason.' Granted; but might not its fifty pages have been produced in the lucid intervals of a period of extreme excess? To repel the charge of licentiousness was a much easier matter; for this charge was confined to his relations with Madame Bonneville, who followed him to this country with her children, and was the object of his generous charity. When carefully considered, the evidence would seem to show that in an adulterous generation Paine was superior to the vice that smirched some of the most distinguished men.

Mr. Conway is deserving of much credit for the patience with which he has burrowed in contemporary records, in collateral biography, and in the hearsays and traditions that have seemed to promise some illumination of his long and painful way. He has brought many valuable and interesting things to light. The contemporary testimonies to the dignity of Paine's character, the graciousness of his behavior, and the value of his services which are brought together, are such as might have made a man less naturally vain extremely proud, while they completely overwhelm the counter-testimonies of his religious and political opponents. And yet there is a haunting afterthought that will not be dismissed. It is, Why, when Paine did so much and was so much, was he not more? After he came back to America in 1802, with Federalist and theological animosity both against him and continually strengthening each other, it was not strange that he became a doubtful friend for the most friendly. But long before that we are constrained to wonder whether there was not lacking something of solidity in him; whether his talent was not so much more evident than his character that even those who valued him most highly could not take him quite so seriously as he took himself.

He took himself very seriously indeed, and Mr. Conway does not take him a whit less so. Paine's self-consciousness was intense and his vanity extreme. Not content with a prodigal use of the first person singular, he has much to say of "Thomas Paine" and "Common-Sense," a synonym of which he never tired. Speaking of the reason which God had given him, he adds, "And I gratefully know that God has given me a large share of that divine gift." The proverb that the vain are never proud had in Paine's case the amplest illustration. A little pride would have saved him from a good deal of chagrin. Mr. Conway has only praise for his generosity in giving up the profits of one publication after another, but we could go with him much more heartily if afterwards he had not insisted on his gratuitous services and made himself the pensioner of this and that bounty, like the daughters of the horse-leech, for ever crying "Give." It was a true bill, that of Gouverneur Morris, when he found him supremely lacking in that common sense to which he laid a special claim. He had plenty of it in dealing with "soft money" and other aspects of concrete politics; he had very little in managing his own affairs. His cosmopolitan sympathies made him "a man without a country," and without the stability or adaptability which insures practical success. The brilliant talents which in our time would have made seven cities claim him as the editor of as many leading journals, left him a century ago a writer of pamphlets, and of letters in which he made a present of his opinions to some who valued them and some who did not, but who paid as little for them in the one case as in the other. While estimated by himself and many other generous spirits as a Universal Enlightener and Reformer, it is evident that to many others he appeared to be a mere adventurer. There is a golden mean between these two extremes, but it is not hit by Mr. Conway in his estimation of Paine's character and work. The epithets he heaps upon him—"this founder of republics," etc.—and the grandiose way in which he speaks of him throughout, though they may please and satisfy a multitude of Paine's adherents who needed no addition to their confidence in his supremacy, will have a tendency to make him seem absurd to those who come to Mr. Conway's book with any proper sense of relative values in the history of great events. Paine was one of the greatest of his kind, not exceeded by any of these in the picturesqueness or the tragedy of his career; but his kind was not that of Cavour and Stein and Deák; it was that of Cobbett and Defoe. He was one of the greatest of the pamphleteers, and in America his pamphlets were half-battles in "the times that tried men's souls."

This happy phrase is one of several of Paine's phrases that are now in daily use, and one of many that he coined on which his image and superscription were as unmistakable. He was a maker of phrases and he loved the things that he had made. We know this by the way he fondles them, repeating them as affectionately as does Tennyson the phrases that he loves. But his strength as a writer was not more in special phrases than in the even tenor of his style. Jeffrey's wonder as to where Macaulay picked up that style is even more pertinent of Paine. A single pamphlet, printed in 1772, was his only public writing before he came to America with Franklin's modest recommendation in his pocket, and but little else. There was in that no hint of 'Common Sense,' nor even of the best articles which he wrote before that for the *Pennsylvania Magazine*. As for the theory that he was the author of the 'Letters of Junius,' Mr. Conway mentions it respectfully, and disposes of it effectually in a dozen lines. It would have been enough to say that, were there a hint of Paine's style in Junius, it would have been as impossible for him to keep a secret so flattering to his vanity as for him to "get himself crucified and rise in three days," as Talleyrand advised one of his set to do if he would found a new religion. As we should expect, the author of this theory, Mr. W. H. Burr, also maintains the Baconian authorship of Shakspere. That Paine wrote the Declaration of Independence is another item of Mr. Burr's belief that somebody else wrote everything. Mr. Conway entertains so much of this suggestion as pertains to the rejected anti-slavery clause. "There can be little doubt," he says, "that this was written by Paine, or by some one who had Paine's anti-slavery essay before him." He then quotes Paine's words and the rejected clause in parallel columns, proving that the resemblance was not remarkable, and then continues, "Thus did Paine try to lay at the corner the stone which the builders rejected and which afterwards ground their descendants to powder." This passage from the indefinite to the definite, from the uncertain to the certain, is one of many such in Mr. Conway's book. Another is where Paine returns to England, and to his mother in her ninety-first year. "As she lived to be ninety-four, it may be that he sat beside her in the Quaker meeting-house." This on page 230, vol. i., and on p. 232: "While in America the States were discussing the Constitution proposed by the Convention, Paine sat in the silent meeting at Thetford, dreaming of the Parliament of Man and federation of the world." In general, Mr. Conway uses the Quaker antecedents of Paine for a great deal more than they are worth; but far more questionable is his finding of the root of Elias Hicks in Paine for no better reason than that his cousin, Willett Hicks, was kind to Paine in his last days, and was one of the half-dozen people who followed him to his lonely grave. There is a good deal of vague surmise in Mr. Conway's book, even where it is least admissible, as in the charge against Gouverneur Morris. He makes it plain enough that Morris was jealous of Paine's influence in France, and inimical to him; also, that his hostility kept Paine in prison for ten months, as his friendly disposition would have prevented his going there at all. This is bad enough. That Morris was at the bottom of a "conspiracy" against Paine, which resulted in his imprisonment as an Englishman, should have more evidence than Mr. Conway furnishes to be confidently received. Paine's sense of Washington's unkindness during his imprisonment and afterwards is one of the most distressing features of his history. Before expressing itself in the abusive public letter which, after the 'Age of Reason,' has most hurt his fame, it expressed itself in a private letter for a reply to which he waited long in vain. It is one of Mr. Conway's many guesses, and one of the most attractive, that Timothy Pickering, then Washington's Secretary of State, suppressed this letter.

Paine had done much good service with his pen, and in various clerical positions, in the years following the war, when in 1787 he went to England with the plans of an iron bridge which he had invented. The flattering reference to his invention which Mr. Conway quotes from the 'Encyclopædia Britannica,' is from the eighth edition, and in the ninth it is withdrawn, along with the credit given to Paine for the bridge at Wearmouth; but of Paine's right to be accounted one of the pioneers upon this line there is no doubt. Paine's English friends were creditable both to his mind and heart; William Blake, called "Pictor Ignotus," was one of the more intimate, and to his sagacity Paine was indebted for his escape from England in 1792, when he added fuel to his 'Rights of Man' with an inflammatory speech. Mr. Conway's summary of that famous pamphlet, Part II., is not flattering to Paine's ability as a political philosopher—there is hardly an item of the summary that would be accepted by a careful publicist of our own time—but its strength was in its definitions only in a subordinate degree. That it made a tremendous stir and scare in England there can be no doubt, and Paine did not get off a day too soon. In France his intimacies for the most part were with the best men of the Convention, and Condorcet was his closest friend. Mr. Conway infers that Paine had much to do with Condorcet in shaping the constitution which the Girondists wanted, while the Mountain preferred chronic revolution. It was Paine's preference for law to revolution, and his anxiety to save the life of the King, that

made him an object of suspicion to the revolutionary party. His inability to speak French must have been a serious bar to his enjoyment of society, and have kept him in imperfect touch with men and things. When the Girondists were arrested, Paine absented himself from the meetings of the Convention, but he was not thrown into prison until December 28, 1793. There, by a happy accident, he escaped the guillotine, but a fever brought him nigh to death, and he came out November 6, 1794, a physical wreck, to enter the family of Minister Monroe, where, tenderly cared for, he gradually regained his health.

The first part of his 'Age of Reason' was written just before he went to prison, and the second part during his confinement. Mr. Conway is not a little embarrassed in dealing with Paine's religious character, for he wishes to be sympathetic and he finds it difficult to be so. There never was, in fact, a doughtier advocate than Paine of that natural religion which is Mr. Conway's pet aversion. In his religious writings Paine stood for the religiousness of science as he stood for nothing else. That men should imitate the goodness of God as it is revealed in nature, is the sum and substance of his doctrine of religion. But to Mr. Conway, nature, especially inorganic nature, is simply devilish, and he does his best to wring from Paine a testimony favorable to his own opinion, but with no appreciable result. He chooses to call Paine a Theist, though the words Theist and Deist are generally supposed to connote different ideas, and Paine was as representative a Deist as any of his time; his God a mechanical creator, not an immanent life. Mr. Conway does not exaggerate the religiousness of Paine's theological writings. They were written to vindicate the character of God from what he considered the most hateful misrepresentations. For Jesus also he had only honest reverence. We look in vain to Mr. Conway for any adequate indication of the defects of Paine's criticism of the Bible. His negative results have very generally been justified by subsequent criticism and multiplied a hundred fold. As a zephyr to a tornado is the destructive force of his criticism of the Old Testament prophecies to that of Kuenen's 'Prophets and Prophecy in Israel.' But of the moral dignity of the prophets he had no appreciation, and he had as little of the ethical and spiritual qualities of the Psalms, the Gospels, and the Epistles, and of the processes by which the writings of the Old and New Testaments came to be accepted and revered with but a little of the pious fraud in which he finds well-nigh their whole account. It is, unfortunate, but it is true, that what has attracted to Paine a great majority of his followers has been, not his religiousness, but his negative assault on Christian superstition; and this has been because this negative assault is altogether his most characteristic note. The other is a still, small voice; this is the earthquake, the whirlwind, and the fire.

But if Paine's religion was something more than Mr. Conway's love and service of humanity, it was also and preëminently this. With less insistence than upon some other things, our author shows in almost every chapter of his book that Paine was one of the most humane of men, one of the most benevolent and beneficent. It was no accident that one of his first writings in America was a brave assault on slavery, nor that he opposed the execution of Louis, and all barbarous punishments. And the reformer was not a mockery of the man. In all his personal relations he was affectionate and tender, a lover of little children, a helper of the unfortunate. Had his education been equal to his talents, he would have done much better work. The imperfections of his knowledge were, however, less than the imperfections of his taste. It is one of the unconscious humors of Mr. Conway's book that he represents him as a poet who suppressed the sacred fire, for he was utterly prosaic, and never more so than when he "dropped into poetry." This defect entered into his interpretation of the Hebrew and Christian Scriptures, which is marked by the baldest literalism throughout. When every abatement has been made, Paine's humanity was so large and pure that nothing could be sadder than the sense of ingratitude and desertion which overwhelmed him at the last.

ROYCE'S SPIRIT OF MODERN PHILOSOPHY.

The Spirit of Modern Philosophy: An Essay in the Form of Lectures. By Josiah Royce, Ph.D., Assistant Professor of Philosophy in Harvard University. Boston: Houghton, Mifflin & Co. 1892. 8vo, pp. xv, 519.

MINDS trained to careful and exact thought are frequently repelled by the looseness and vagueness of what currently passes by the indefinite name of philosophy. In the history of thought, the separate sciences have one by one split off and differentiated into circumscribed and systematized bodies of generalized knowledge, taking little account of the opinions of individual thinkers except in so far as they may be appropriated by others and recognized as of value quite apart from the authority of the individual formulating them. A truth once proved becomes detached from its historical setting, forgets its own father, and stands solely on its merits. The fact that Descartes was the discoverer of a method of combining algebra and geometry is of small interest to the mathematician. Kepler's laws are called Kepler's only for convenience, and the student of mechanics does not care a straw for the authority of Kepler, nor does he enter into any curious inquiry as to the causes in the character and environment of this thinker which led to their formulation. Verification takes the place of an appeal to authority, and a clear line is drawn between science and the history of science; the latter being regarded as a department of historical study, and a science only in the sense in which history in general is a science. Few students think it necessary to look into it.

In recent times psychology and ethics seem to have made some progress upon this road. Discussion has become more impersonal, more scientific in method, less given to seeking authorities and threatening with consequences. Philosophy, as it is generally taught both in America and in Europe, is still literature, biography, or history, rather than an independent discipline embodying a systematic doctrine. It may be sufficiently interesting to know that Kant ate one meal a day, that Hegel wrote dreary love-letters, that Schopenhauer was a generally offensive character and quarrelled with his mother. But what have these things to do with the correctness of the distinction between phenomena and noumena, the theory of universals, or the doctrine of the "World as Will"? It is quite possible that Socrates would have had less confidence in the moral order of the universe had he been afflicted with intestinal indigestion, but that purely personal fact should have little significance to one weighing the objective value of his doctrine. However, the general public wants literature and biography when it attends lectures on philosophy, and Prof. Royce has prudently sugared a pill which the plain man finds it difficult to swallow unless disguised.

It is not merely in the historical part of his book (Lect. II. to IX.) that Prof. Royce shows a tendency to regard philosophy rather as literature than as science. He reveals throughout a literary horror of being found uninteresting, and in his introductory lecture (p. 23) he makes a frank confession of his feeling. He says:

"I love the variety of the philosophers, as I love the variety of the thoughtful looks which light up earnest young faces. I love all these because they express passion, wonder, truth. But alas for me if ever I have for professional reasons to study a book behind whose technical subtleties I can catch no glimpse of the manly heart of its author. His conclusions may be sound. I shall then hate him only the more for that. Error may be dull if it chooses; but there is no artistic blasphemy equal to so placing the harp of truth as to make it sound harsh and wooden when you strike it fairly. Philosophical books I have read with whose doctrines, as doctrines, I have even been forced in great measure to agree; and yet, so lifeless, so bloodless, were their authors, so reptilian were the cold and slowly writhing sentences in which their thought was expressed, that I have laid down such volumes with a sense of disgrace and rebellion, 'bitterly ashamed,' as a friend of mine has expressed the same feeling in my hearing—'bitterly ashamed to find myself living in a universe whose truth could possibly be made so inefficacious and uninteresting.' "

The type of mind illustrated in this confession is not attracted by a philosophy whose only merit is its clearness and evidence. It is attracted rather by an appeal to emotion. The attentive reader will find throughout the book constant traces of this leaning on the part of the author, and he will do well to keep it in view in weighing the final chapters, which contain Prof. Royce's positive contribution to philosophy.

The sketch of the history of modern thought as represented in Spinoza, Kant, Fichte, Schelling, Hegel, and Schopenhauer is charming reading. The style is clear—though it would be still clearer if a trifle less diffuse—and no little art is shown in the selection of incidents and doctrines. The writer is in evident sympathy with the men he discusses, and possesses in a high degree the historic sense which sees a man in his context and seizes his meaning fairly. The connection of the successive systems is well brought out. There is much biographical detail which has little to do with philosophy, but these lectures were delivered before popular audiences, and popular audiences must be entertained much as Epicurus is said to have entertained his followers and enlivened the tedium of scholastic labors. On the whole, we are of the opinion that these popular lectures may profitably be read even by those who have an acquaintance with the original authors, for along with the exposition there goes a running commentary of criticism which reveals more or less clearly the standpoint of the lecturer. He appears to have been influenced greatly by Hegel and Schopenhauer, though most, perhaps, by the latter. Indeed, the doctrine of the "World as Will" needs little modification to express fairly his philosophic faith.

Prof. Royce's own doctrine, embodied in the last four lectures in the book, must be judged on its merits as an attempt at a body of consistent reasoning founded on evidence. Its literary expression and artistic form, its appeal to "passion and wonder," its revelation of "the

manly heart of its author," must all be set aside as quite extraneous to the question at issue, which is simply and solely the consistency of the doctrine and the cogency of the reasons for accepting it. Any literary embellishment other than that which conduces to perfect clearness is rather objectionable than otherwise. A multitude of words and illustrations may conceal looseness and inexactitude in reasoning, and, indeed, they constantly have precisely this result. Prof. Royce himself appeals to such a treatment of his reasonings as we conceive to be the proper one in maintaining (p. 435) that his doctrine is "the outcome of a rigid logical analysis."

This, however, we cannot allow it to be. The doctrine, briefly stated, is as follows: The one indubitable fact is the existence of an Infinite Self, a Logos or World-mind (p. 345). That it exists is clear (1) because Idealism has shown that real things are nothing more nor less than ideas, or "possibilities of experience"; but a mere "possibility" as such is nothing, and a world of "possible" experience, in so far as it is real, must be a world of actual experience to some self (p. 367). If, then, there be a real world, it has all the while existed as ideal and mental even before it became known to the particular mind with which we conceive it as coming into connection (p. 368). (2.) But there is such a real world, for when I *think of* an object, when I *mean* it, I do not merely have in mind an idea resembling it, for I aim at the object, I pick it out, I already in some measure possess it. The object is then already present in essence to my hidden self (p. 370). As truth consists in knowledge of the conformity of a cognition to its object, that alone can know a truth which includes within itself both idea and object. This inclusive knower is the Infinite Self (p. 374). With this I am in essence identical (p. 371), it is my larger self (p. 372), and this larger self alone is (p. 379). It includes all reality, and we know other finite minds because we are one with them in its unity (p. 409).

This doctrine is supposed to give us freedom and content with the system of things. All our volitions in the world of sense are determined, but since the Logos in a *timeless choice* elected that things should be as they are, and we are in essence identical with him, we are free as partaking in his timeless choice (p. 433). And though the existence of evil cannot be denied, we may rest content with the world in the reflection that the Logos would have chosen a better world had he been dissatisfied with this one (p. 439).

As one may readily see, the reasoning which endeavors to establish the existence of the Infinite Self is loose and inconsequent, and the consolation to be derived from the doctrine more than dubious. Prof. Royce constantly distinguishes between ideas and the objects supposed to correspond to them, and he as constantly makes his point by overlooking this distinction. He sets out to search for "something yonder that corresponds in fact to this series of experiences in us" (p. 360). He expects to find this something a system of ideas "outside of our minds, but not outside of every mind" (p. 360). He seeks for a reality that our minds "resemble" (p. 361), and of which our experience is only the "copy" (p. 360). This reality exists before it becomes known to the particular mind we conceive as coming into connection with it (p. 368). Thus the reality is one thing, and the experience in this particular mind quite another. The problem is to pass from the experience to the reality.

This clear line between our ideas and what is supposed to correspond to them is promptly rubbed out in the assumption that when I *think of* an object, when I *mean* it, the object itself is already present to me (p. 370). True, it is admitted that the object is present only to the "hidden self." But since I, the self to which consciousness testifies, have only the thought of the object, the "copy," the personal "experience," I must surely give some reason for assuming the existence of the object other than the presence of the copy in me. Otherwise the existence of the object itself is by no means established. And as the "larger self" is "hidden," and is assumed merely as a something that shall include my "copy" and the object corresponding to my "copy," its existence goes under a cloud with that of the object. In short, Prof. Royce's "larger self" is simply a receptacle for smuggled objects—objects brought in free of duty because they are declared strictly identical with certain objects on the free list which yet he has carefully distinguished from them.

Individual minds Prof. Royce calls "bits" or "parts" of the Logos (pp. 373, 410, 412, 416, 437, *et passim*), and nevertheless he describes them as "in essence" identical with it (pp. 368, 371, *et passim*). This vague expression may cover a multitude of logical sins. Strictly speaking, they can be identical only with the particular bit they happen to be, and no one of them can in any exact sense be identical with any other. It is a mere playing with words to explain their knowledge of each other as arising from the fact that they are "in essence" identical.

And as to their participation in the "timeless choice" of the Logos, it is enough to say that, according to this doctrine, they never have had, have not now, and never will have any chance to choose at all. Any choice they may make in the lack of time that is left is too unlike what in psychology we know as choice to give any great degree of satisfaction. It would conduce to clearness to give this timeless performance some other name.

Men, Mines and Animals in South Africa. By Lord Randolph S. Churchill, M. P. D. Appleton & Co. 1892. 8vo, pp. xv, 337. Map and illustrations.

Lord Randolph Churchill's letters to the *Daily Graphic* could be dismissed in a few words as a lively but superficial account of familiar scenes, hardly worthy of preservation in book form, but for one reason: his purpose in undertaking this journey to Mashonaland was not that of a mere holiday traveller, but to inquire into the nature and extent of the agricultural resources and mineral wealth of this newly acquired territory. Regarded in this light, his letters have some importance, and can hardly fail to influence in a degree the present fortunes of the British South African Company. The earlier letters give his impressions of Cape Town, Kimberley, and the Transvaal, through which he passed on his way north. This State is described in the most glowing terms, as having a soil of "astonishing fertility," a genial climate, and, possibly, "the greatest gold-field of the world," to say nothing of its silver and coal mines. But all this potential wealth is rendered almost nugatory through the stubborn opposition of the ruling caste to its development. The Boer, according to Lord Randolph, "never plants a tree, never digs a well, never makes a road, never grows a blade of corn." The personification of useless idleness, he "drags out the most degraded and ignoble existence ever experienced by a race with any pretence to civilization." Although all the capital invested in the land is foreign and under foreign direction, although the inhabitants of his largest and most prosperous town, Johannesburg, are mainly English, and though more than three-fourths of his land is now owned by foreigners, the Boer insolently denies "all political and even municipal rights to persons residing in the Transvaal other than of Dutch birth." These are strong assertions, but other travellers tell substantially the same story, and the time is probably near at hand when, as Lord Randolph not obscurely hints, the Englishmen of the Transvaal "will impatiently jerk from their shoulders the government of the Boers."

Mashonaland proved in nearly every respect a disappointment, the greater because of its contrast to the coveted territory of the Boers. As regards its agricultural resources, our author's testimony is that "on the low veldt, where the soil is of extraordinary fertility, fever and horse sickness afflict human beings and exterminate stock; on the high veldt, where neither of these evils extensively prevails, the soil is barren and worthless." With respect to the value of its mines his conclusion, mainly the result of the investigations of an American mining expert whom he took with him for this purpose, is that gold has not yet been discovered in paying quantities—in other words, that the mines have been apparently exhausted by the prehistoric gold-hunters, the massive ruins of whose fortress-temples are still to be found in this region. Possibly the great contrast to the Transvaal, with its fertile soil, healthy climate, and rich mines, has colored somewhat too darkly the author's views, but the truth seems to be that the "hinterland" must first be filled up before Zambesia can greatly attract the European emigrant. Still, it should be said that there were some encouraging indications. During the two months in which he was at Fort Salisbury, the principal settlement, Lord Randolph observed "a noteworthy increase in the size and a marked improvement in the character of the township. Tents and wagon dwellings had rapidly given place to well-constructed huts, and these latter were being to a considerable extent supplanted by buildings of brick, of which material a fair quality is being manufactured here." Virgin gold-reefs which have escaped the quest of the Phœnician or Arabian miners, may also be discovered at any time, as well as other mineral wealth.

There are excellent descriptions of camp and wagon-life while crossing the veldt, and many readers will enjoy the account of the author's numerous and sometimes exciting experiences in hunting. Though the great game is getting scarce, lions, ostriches, and elands are still occasionally to be found, while the smaller antelope are plentiful in some districts. The pictures which originally appeared in the *Daily Graphic* have been reproduced in this volume, but, with a few exceptions, they can hardly be said to add to its attractiveness. A good index and an admirably clear map of all South Africa south of the Zambesi add materially to the value of the reprint as a book for reference.

Marriage and Disease: A Study of Heredity and the more Important Family Degenerations. By S. A. K. Strahan, M. D., Barrister-at-Law, etc., etc. D. Appleton & Co. 1892. Pp. 313.

It is consistent with the double profession of

medicine and of law, which the author avows upon the title-page, that the medico-legal aspects of this book should suggest at once its limitations and its aims. Far from being a critically scientific study of heredity in general, or of the evidence in regard to the transmission of acquired characteristics, it is the purpose of the book simply to give a useful statement of the manner in which disease is handed down from generation to generation, and of the ways in which nature may be assisted or thwarted in the endeavor to perpetuate the normal man. Fortified by numerous quotations from standard works, the author is content to take for granted many things actually in dispute. His purpose is not controversial, but descriptive and educational. The five so-called "laws" of heredity are admittedly arbitrary divisions of one great principle—useful chiefly for descriptive purposes, and capable of being extended or contracted to suit the style of exposition. And here, as in other parts of the discussion, the author's canons of exposition do not forbid the introduction of personal conviction in the absence of more positive proof. In short, the hope embodied in the treatise, with constant and more or less unskilful reiteration, is the not unfamiliar one that man may learn to apply to the improvement of his own species the principles of generative selection which he has already learned to apply to the beasts that perish. It is admitted that marriage and the "choice of partners" is at present largely a matter of blind instinct; but this blindness—at all events the excuse of ignorance—it is the duty of science to remove. To those unfortunates in whom the taint of disease is irremediable, it should say: Refrain from perpetuating your misery in offspring; to that larger class whose heritage may be purified, it should point out the remedy; to those whose pedigree is pure, it should teach the way of guarding the precious legacy and transmitting it unimpaired. Nay, more:

"Nowadays, when the maniac, the melancholiac, and the would-be suicide of yesterday, the imbecile, the epileptic, and the habitual drunkard are married and given in marriage, the suffering has become so terrible, the contamination of the race so great, and the care of the useless offspring so heavy a charge upon the community, that if some effort be not made voluntarily to stay this curse upon the land, the Legislature must be called upon to interfere."

Obviously this is but a restatement of the familiar paradox of the survival of the unfittest, under the régime of sympathy that is the outcome of the humane and moral sentiments by which we measure the advance of civilization. In the "primitive and natural" condition of society, the unfit pays the penalty of his inability to adapt himself to his environment; in our philanthropic wisdom we adapt the environment to the unfit, and aid him by every device known to science to propagate his kind. Unquestionably there is a tendency to darken the picture. Statistics of disease would be lugubrious at best; but when to hereditary transmission of certain disorders there is liberally added the "transmutability of diatheses," it is easy to prove all the rest. Everything is reduced to the convenient common denominator of a "degenerate condition," which may manifest itself in one generation as gout and in the next as rheumatism, in one as habitual drunkenness, in another as epilepsy, and again as insanity, idiocy, or instinctive criminality, and so on through the category of alleged transmutations, so that it is not difficult to gratify the author's predilection for detecting hereditary "predisposition" for all the protean forms of disease.

When all qualifications are made, however, it must be admitted that the problem is grave and the need of enlightenment very great. It is a matter of regret, therefore, that the author could not have couched his instruction in more dignified and persuasive terms. Doubtless it may be urged that there is precedent for the somewhat hysterical rehearsal of Lecky's famous arraignment of legislation for refusal to provide proper sanitary measures for the repression of the disease spread by prostitution; but in the denunciation of the "canting blockheads" and "puling sentimentalists" who excuse selfish or ignorant disregard of the laws of heredity, the author's language shows none of the persuasive eloquence of understatement. There is, rather, a certain hortatory petulance, which sometimes comes from habitual treatment of all the world as a sick man.

Each chapter, after rehearsing in language suited to popular comprehension the gruesome characteristics of some such disease as cancer, scrofula, phthisis, epilepsy or gout, closes with the crucial inquiry as to who should marry. General rules borrowed from the stock fancier's manual are suggested as to the disastrous results of breeding "in and in" where the contracting families are tainted with allied forms of disease, and the beneficent results of "crossings"; but the gist of the whole matter for people contemplating matrimony is, "Consult your family physician." Indeed, it is no disparagement to say that this is probably the best advice to give such sensitive and conscientious people as may contemplate reading the book. Susceptible people, unfamiliar with the exaggerated effect produced upon the imagination by the massing of rather ghastly pathological details, are prone to make uncomfortably personal applications of imperfect knowledge.

Villainage in England: Essays in English Mediæval History. By Paul Vinogradoff, Professor in the University of Moscow. Oxford: Clarendon Press; New York: Macmillan. 1892.

Not long ago it was common for philosophers to maintain that man was originally a pure and enlightened being, and that what we call progress as revealed in history was a struggle to return to the primordial state of blessedness. The grounds of this theory were largely Biblical, but not altogether so, for the belief in former *Saturnia regna* seems to have been almost universal, and the speculations of Rousseau were acceptable to many who rejected the Christian theology. It was in harmony with this tendency that many students of social institutions declared that in the mark or Teutonic village-community individual liberty existed in a high degree of perfection, and that the serfdom of feudal times represented a period of degradation. This view was supported by such an extensive array of evidence, and was upon many accounts so agreeable to the spirit of the present age, that it came to be regarded as certainly demonstrated, and it is hardly necessary to say that it plays an important part in the theories of the reformers of land tenure.

The researches of certain scholars, notably Mr. Seebohm and M. Fustel de Coulanges, have recently disturbed this somewhat too complacent unanimity as to the degree to which freedom prevailed among our Teutonic ancestors. Facts have been disclosed giving support to the view that during the feudal period there was much acquisition of rights by the subject population. Some rights were lost, but others were gained; and it has been plausibly argued that villains are to be regarded, not as the degraded offspring of freemen, but as the partly emancipated descendants of slaves. It is true that Tacitus drew an edifying picture of the free Teuton; but he is by no means silent as to the unfree members of the community, and some modern scholars have certainly failed to make room in their reconstructed villages for this important part of the population. Human bondage was an almost universal institution in early times, and slaves were at least as valuable to the primitive agriculturist as cattle are to the farmer of the present day. When a conquest was made, no doubt great numbers of the conquered were slain; but great numbers also were enslaved, and it is not to be supposed that the Anglo-Saxons either extinguished the existing inhabitants of Britain, or admitted them to an equal social position with themselves.

It seems evident, therefore, that the last word has by no means yet been said upon this subject, and that much more study is required before positive conclusions can be formulated. The work now before us is a good example of what should be done in this direction. The author is thoroughly modest; he does not profess to have achieved great results, and he manifests the most careful regard for the results obtained by other laborers in the same field. He exhibits in his introductory chapter a thorough knowledge of the progress that has been made in these investigations and a correct appreciation of the positions taken by the several investigators. In fact, this introduction is an admirable presentation of the history of our progress in this department of research, and to have written it establishes the competency of the author to further this progress. It is satisfactory to know, although we do not require other assurance of the author's capacity than the work itself, that he has been assisted by the friendly counsel of such men as Pollock, Maitland, and Seebohm, and we may add that his style seldom suggests that the writer is not an educated Englishman. In spite of this, he apologizes gracefully in his preface for presuming to explore this field, reminding us that to a Russian it is one of peculiar interest, the existence of serfdom in his country having ended but yesterday, while the village community is still flourishing.

As to the results reached by Prof. Vinogradoff, we can only say in general that they are such as he adduces evidence for. His work has lain among the records, and he cites his authorities for all his statements, but attempts no brilliant generalizations. He produces his effect by a thousand little touches, every one by itself trifling, but effective through cumulation. He displays nothing of the historical imagination which makes Seebohm's work so telling and distinguishes, though to a less degree, that of Gomme. Nor does he, as we hoped might have been possible, throw any light upon English problems from Russian analogies. His book, therefore, appeals only to specialists, and it would be futile to attempt here to consider the multitudinous details which it elaborates. In general, it may be said, he maintains that the status of the villain was better than has been supposed; that he was a free man as regarded every one except his lord, and as against him the law gave the villain much protection. Even in the thirteenth century, "we come across remnants of a state of things in which one portion at least of the servile class had civil rights as well as duties in regard to the lord." When status was in question, the presumption was in favor of freedom, and "however complete the lord's

power over the serf may have been, it was entirely bound up with the manorial organization."

Much stress is laid upon the existence of tenant-rights in manors in ancient demesne, it being fairly inferable that these rights survived from the Saxon period. A careful examination of the theories of the lawyers leads to the distinction of three elements in villainage. "Legal theory and political disabilities would fain make it all but slavery; the manorial system ensures it something of the character of the Roman *colonatus;* there is a stock of freedom in it which speaks of Saxon tradition." More emphatic is the statement that the administrative constitution of hundred and county is derived from a social system which did not recognize the feudal opposition between freeholder and villain, and that in short the villain population was, to a large extent, originally free. Prof. Vinogradoff considers that this position may be maintained in spite of the fact that the communities mentioned in Domesday are described as almost entirely peopled by villains. The villains of Domesday, in his view, include customary freeholders. The discrimination of this third class, between freeholders and villains, is perhaps as important as anything suggested by this author.

In the intermixture of strips in the open fields evidence is found of the communal origin of property, the allotment being intended to equalize shares. The system became rigid from the manorial administration, which used it in the adjustment of labor and rent. Rights of common have a similar origin. In general, so far as any controlling theory is adopted, Prof. Vinogradoff's view is that the manorial structure was imposed upon the village community, in which freemen were to a greater or less degree an element. No satisfactory explanation is offered of the appearance of the lord of the manor, or of the origin of the manor, a link that should be supplied to make the theory complete. But the treatment of details is very elaborate, and the results go far to support the author's conclusions. More than this, upon such an obscure and controverted subject, we do not think it necessary to say.

The Early Days of My Episcopate. By the Right Rev. William Ingraham Kip, D.D., LL.D., Bishop of California. Thomas Whittaker. 1892.

THE title of this volume does not indicate that part of it which secures for it a certain lively interest. The early days of Bishop Kip's Episcopate will find few to care for them; the early days of California which coincided with them will find many more. The book was written in 1859 and 1860, with the intention of bequeathing the MS. to the author's family; but, having lived so long as to become, as it were, his own posterity, he has yielded to the solicitation of friends and printed it without alteration or addition. He would have done well, after the manner of Dana in the edition of 'Two Years before the Mast' published in his later life, to write a supplementary chapter giving a comparative view of the old life and the new.

Dr. Kip was appointed a Missionary Bishop of California in 1853, and sailed for Aspinwall on December 20, and, as men note the most unimportant circumstances on occasions of first-rate importance, he notes that one of those who came to see him off was the Rev. J. H. Hanson, who brought him 'The Lost Prince,' which came out that very day—an attempt to show that Eleazer Williams was Louis XVII. The trip to California was extended over forty days and diversified by the wreck of the magnificent coastwise steamer the *Golden Gate* in the harbor of San Diego, a wreck having no tragic implications, but all the more preposterous ones of the wreck of the *Royal George.* The general account of the trip, and especially that part of it which relates to crossing the Isthmus, would be pleasant reading on a through car from New York to San Francisco, such as the traveller may now enjoy—if gaining, also losing, much.

Bishop Kip remained in California till 1857, when he came East to be made a Diocesan Bishop and returned invested with his new office, to spend the remainder of his life in the work of his bishopric. The chapters of his book detail his first attempts to establish the services of his Church in different places, and there is a pervading humor in their incongruity with the social setting. Some confusion of the point of view is occasioned by transitions from a contemporary journal to the final reminiscence. A few dates would help to a better understanding: we would know, for example, more exactly when the population of San Francisco numbered 30,000 males and 5,000 females. The fabulous prices of various articles will interest the younger generation and for older people bring back the old surprise. Apples at five dollars apiece in 1854 were singularly unprophetic of the fruit-raising California of to-day. Rents and household service were almost as exorbitant—cooks from seventy to one hundred dollars a month and nurses at five dollars a day. A good deal of the local color, it must be confessed, is blood-red. Gentlemen were indicated as "the man who killed ——— in a duel" or "who shot ——— last winter"; and these little histories did not affect injuriously one's social or political standing. The theory that morals vary more in character than in amount is strengthened by some recent echoes of life in San Francisco that have floated hither. Their burden is that handsome houses there are now indicated as sheltering this or that form of conjugal infelicity or irregularity. In Southern California the people "had no doubt the Church could be established under very favorable circumstances. They wanted something which did not preach Nebraska or Kansas, slavery or anti-slavery," etc. These are the most familiar words in a volume which deals exclusively with the circumstances of an almost forgotten episode of Western civilization.

The Atlantic Ferry. By Arthur J. Maginnis. London: Whittaker & Co.; New York: Macmillan & Co.

THIS book is somewhat similar in its scope to the volume recently published by the Scribners upon 'Ocean Steamships,' but much less popular and attractive in its treatment of the subject as well as in its text and illustrations. It contains, however, considerable matter which is both useful and interesting, and fulfils with a certain degree of success the author's intention to produce a handy and simple book of reference for those engaged in the Atlantic service; and to a less extent it may be consulted by the "thousands of passengers who are ever passing to and fro on the great Ferry."

The first chapter gives a history of the early steam navigation of the North Atlantic, with a reference at the beginning of the chapter to the famous lines of sailing packets from New York to Liverpool antedating the steamers. One of these vessels, the *Dreadnought,* leads the sailing record by a passage of only nine days and seventeen hours from New York to Queenstown. After the narration contained in this chapter of the occasional and irregular steamers which first crossed the Atlantic, the author proceeds to give in seven chapters an historical account of the various companies and lines that were formed and operated to cross the Atlantic regularly with steamers of increased speed and capacity. He begins with the Cunard line, passes next to the Collins line, and ends with the lines that sail from the ports of the Continent.

Other chapters of the book are devoted to the workings of an Atlantic steamship line on shore and afloat, to the advance in the construction of the vessels, and to the development of the various methods of steam propulsion. Brief notice is also taken of some of the men who have designed, built, and managed the steamships of the transatlantic lines. In the case of the Cunard line, the author recalls a notable event in Boston history by printing a graphic relation of the sailing of the *Britannia* from Boston harbor in 1844, when the harbor was frozen with ice seven feet thick at the wharves and two feet in thickness for a distance of seven miles. The story of the cutting of the channel and of the scenes accompanying the departure of the mail steamer is still told with gratification by the older watermen of Boston harbor. The Cunard line, notwithstanding the fact that its steamers are just now eclipsed by the express steamers of the Inman and White Star lines, has maintained its general preëminence among the Atlantic lines, and the two new steamers being built for this company will lead the merchant fleets of the world in size and speed as well as in cost and elegance. The plan pursued by the British Admiralty in giving a special subvention to a limited number of Atlantic liners constructed in accordance with their requirements for service as armed cruisers in time of war, is both wise and economical. It allows a larger proportion of the annual expenditure to be used for vessels required in the line of battle. It gives a tangible return for the money invested by the Government, and is of mutual benefit to the Government and to the steamship company. In its nature it is unlike a postal subsidy, shipping bounty, or mileage subvention.

The author has drawn so largely from his scrap-book in making this volume that it is suggestive at times of padding; but he has also incorporated a number of original diagrams and statistical tables which will be useful and interesting to those desirous of studying the development of the noble vessels that ferry across the Atlantic.

The Science of Nutrition, etc. By Edward Atkinson and Others. Springfield, Mass.: Clark W. Bryan & Co. 1892.

THOUGH this volume contains essays on food-values and dietaries in keeping with its title, its chief interest lies in its description of Mr. Atkinson's invention, the Aladdin oven. Impressed by the elaborate unsuitability to its purpose of the ordinary kitchen range, he some years ago began experimenting with various other methods of cooking, and has at last satisfied himself by the substitution of a paper box for the iron box that we now try to bake in. From the non-conducting character of the oven walls, there results a surprising economy of fuel, so that almost or quite all the cooking for a family of moderate size may be done with one central-draft lamp. This seems less astonishing when we remember that the heat of the lamp is strictly confined to its own

work, cooking food, very little escaping to raise the temperature of the kitchen and the temper of the cook to their ordinary "summer heat." Economy of food as well as fuel, it is affirmed, attends the use of the Aladdin oven, since the cheaper meats, grains, and vegetables are so improved in taste and digestibility by long cooking at moderate temperatures as to be really better than more expensive kinds of food cooked in the common way. This long, slow cooking is just what cannot be managed in our fickle ranges without close watching, but the Aladdin oven, it seems, may be left to itself for hours at a time in perfect assurance that all will be well. It is even said that the family may sleep care-free while their breakfast cooks all night. The use of a thermometer to determine the heat of the oven and of accurate time-schedules promises to put the art of cooking on an exact and scientific basis, and will leave to the ridicule they deserve such ancient devices of oven-testing as "holding your hand in while you count thirty," and other trials by ordeal. In fact, the regulation kitchen range, however expensive and complicated, is shown to be merely a concession to barbarism—a clumsy, uncertain, wasteful device, likely to cook imperfectly even with intelligent care, and too often serving out at one time those two unappetizing dishes, singed beefsteak and barbecued cook.

The Aladdin oven, though in its nature especially fitted to bless the poor, will probably fail when put into the hands of coarse and ignorant women either in their own homes or in well-to-do kitchens where they rule the roast, as the greater exactness possible and necessary in using it will be anything but a recommendation to those who value luck as an excuse for their own shortcomings. Its greatest success should be scored in thrifty homes of the middle class. There are plenty of people who are poor enough and at the same time intelligent enough to welcome such an invention when once tried. The frugal housewife who used to sigh over her receipts beginning, "A pair of full-grown but fat and tender chickens" will smile, perhaps, with incredulity, to read one of Mr. Atkinson's: "Order the toughest old gander that can be found in the market," etc.; but she will be sure to feel a real satisfaction on learning how to make such unpromising material not only eatable but good. Whether we conclude that Mr. Atkinson has completely solved the kitchen problem or not, we must admit that the Aladdin oven marks a long step in the right direction of applying science in the very department of our household economy where it has been most ignored.

The Anglo-Saxon Towns and Their Polity. Inaugural Dissertation for the Degree of Doctor of Philosophy at the University of Berne. By George Emory Fellows. [Genehmigt von der Facultät auf Antrag der Herrn Prof. Dr. Woker und Prof. Dr. Hidber.] Berne: Michel & Büchler. 8vo, pp. 88.

THIS is a remarkable little book. It is devoid of logical sequence in the arrangement of the matter; it exhibits ignorance of English history and of the very rudiments of historical method, as well as crudeness of thought; it teems with misstatements; its English (including spelling and punctuation) is wretched. In fact, not a page of the book is free from slovenly errors.

In enumerating eighteen titles on p. 7, the author makes about twenty mistakes. He evidently thinks that "Rerum Brittanicarum (*sic*) Medii Aevi Scriptores" is the title of a single treatise (pp. 7, 23, 27). This is like referring to Rolls Series, p. 30. He cites the Anglo-Saxon laws in a similar unscholarly way, thus betraying lack of familiarity with them, or gross negligence. Such references as Ethelred, section 6, are almost meaningless when we consider that there are eight collections of Ethelred's laws, each divided into chapters, and, in some cases, subsections. Dr. Fellows often cites other sources and secondary authorities with even less accuracy.

But these are trifling flaws compared with the chief defects of the book. In the narrow field of Anglo-Saxon municipal history the literature is not extensive, and can be mastered in a very short time. Dr. Fellows has not done this. He misrepresents Thompson's views regarding the early history of English boroughs (pp. 9, 20). The latter believed in their Germanic origin, not in their derivation from the Romans. With Coote, the chief exponent of the Roman theory, Dr. Fellows shows no acquaintance. The "earliest formal treatise" on English boroughs was written, he says, "some time previous to 1688." "When we consider that this author wrote during the reign of James II. . . . strong suspicion must fall upon his theory" (p. 5). Brady wrote his treatise in 1690. Merewether and Stephens, commonly regarded as the best authorities on English municipal history, are constantly cited as "Mereweather and Stevens." Dr. Fellows has great faith in Blackstone as an historical authority. What the latter says about Anglo-Saxon institutions is accepted without hesitation. Smollett, Hume, Nathaniel Bacon, Squire, and other ancients are also resurrected, and turned to account. On the other hand, the author's knowledge of the best modern writers is exemplified by his statements, that "Seebohm believes free Ceorls gradually tended towards serfdom" (p. 26), and that "*all* (*sic*) the authorities upon English history" agree regarding the total obliteration of Roman-British civilization by the Anglo-Saxons (p. 11).

A fundamental error of the work is the failure to regard township and borough as two distinct institutions. With some difficulty the reader ascertains, in chapter i., that the book is really intended as a treatise on towns in the sense of boroughs. On page 14 we find this lucid definition: "Primarily we may perhaps consider a collection of people living in close proximity in permanent dwellings as a town." The following admirably illustrates the author's knowledge of English constitutional history and his method of treatment:

"In the Anglo-Saxon laws the terms town, borough, village, wic, city, hundred, shire, and tything may be seen to be used indiscriminately by different Kings. At the time of the Norman conquest *all* towns and cities were indiscriminately known as *boroughs*. If then we concern ourselves to collect and collate facts relating to usages and government of *towns* [the italics throughout are the author's], we are entitled to consider those relating to any of the above names as characteristic of an Anglo-Saxon town" (p. 14).

The remarkable canon of historical criticism enunciated in the last sentence is followed in the succeeding chapters; township, borough, hundred, shire, and their respective officers, are all jumbled together. To prove a proposition regarding boroughs, any Anglo-Saxon law suffices, even though it refers only to township, hundred, or shire. In like manner burh = borough is confused with burh = castle, and also with borh = surety (pp. 45, 70).

Here are some sample bits of the tattered garb in which the author clothes his ideas:

"Money was paid . . . by weigth (*sic*) when quality was unnoticed and as weighed and burnt when both fineness and weight were tested" (p. 41). "In Charter Rolls No. 64 and of Henry I. to Beverly in 1121, Cities are called upon in 1297 in Laws of 26th Edward I., to send members to Parliament in capacity of boroughs, here the city is called a borough" (p. 15). "No greater evidence of the independence and strength of the towns is found than during the Danish invasion. When the king, Earls, and the forces could not stand successfully against them, it happened frequently that the townsmen drove them away" (p. 87). "What then is the meaning of the term used for people, burg-waru? papu = waru = man" (p. 27). "The Reeve in the Latin version is prefect = Lord, and derived from frith = a peace, it being his special duty to preserve the peace" (p. 38).

What Dr. Fellows calls the "etomological connection" (p. 31) is not clear in these last two quotations. As to typographical errors, they are so common that the reader becomes hardened even to such as this: "Vigfussun and Powells, Corpus Porticum Bosiale" (p. 31)

L'Instruction Publique en France et en Italie au Dix-neuvième Siècle. Par Charles Dejob. Paris: A. Colin & Cie. 12mo, pp. 455.

NEITHER the subject-matter of the four monographs collected by M. Dejob in this volume nor his dreary manner of treating it will attract any but a very limited audience. The first essay is on the boarding-schools for girls established in Italy during the French domination under Napoleon. In Italy the Emperor's interference in education would seem to have been more beneficial than at home. Perhaps this was due to the circumstance that almost any change would have been an improvement. According to M. Dejob, the schooling of girls in Italy, even among the higher classes, was deplorably backward at the beginning of this century. One of the most radical changes made under the French influence was in taking the management of the schools out of the hands of the religious orders. In this one respect at least Napoleon was fully half a century ahead of his time. The internal economy of the schools, however, remained more or less monastic.

In his second essay M. Dejob gives an account of the public courses of lectures established in Paris during the French Revolution, and which, under the names of lyceums and athenæums, flourished, in a more or less languid fashion, until about 1849. They found imitators in other countries, and may perhaps be considered to have given its original impulse to the American lec ure system, which at one time occupied so great a share of the public attention. This attempt to give oral instruction to adults had among ourselves, at least latterly, more of a practical, money-making character, and mixed more entertainment with less instruction, although even the Paris Athénée did not disdain to appeal to the more frivolous element by such devices as music, social receptions, etc.

Construction Details, prepared for the use of students of the Massachusetts Institute of Technology, Boston. By F. W. Chandler. Boston: Heliotype Printing Co.

SOME years ago Prof. Ware printed for the use of the architectural students at the Massachusetts Institute of Technology a series of plates to show the details of construction which are employed in ordinary building.

Prof. Chandler has done the same thing with greater minuteness and completeness in the portfolio of Construction Details which he has just published through the Heliotype Printing Co. of Boston. The general methods of building construction that are in use are not difficult to learn or to teach; but their details are multitudinous, and are in practice acquired but slowly and tediously in the routine of office work, and often slighted in courses of instruction, in which, naturally, the chief attention is reserved for the more difficult branches of an architect's training. It follows that a good many students get into practice without learning them thoroughly, and even, we suspect, a good many architects get to the end of it without finding out such small matters as how the furrings are set for lathing into the corners of a frame house, or how the nailing of the ends of floor-boards is provided for, or a window-sill is made windtight and water-tight. These and the rest of the ordinary methods of good building in wood and masonry, and many that are better than ordinary, are shown with admirable clearness and precision in Prof. Chandler's twenty-five folio plates. The multitude of devices which are more or less used is, of course, too great to be given in any course, and many could only be mentioned to condemn them; but all the usual problems are here solved by methods that agree with the best American practice.

It would do no harm to the cause of popular education if the notes which illuminate the plates were more orthodox in spelling, and if even the preface were more generous in the use of the definite article.

BOOKS OF THE WEEK.

Anderson, Rev. Joseph. The Churches of Mattatuck. New Haven: Price, Lee & Adkins Co.
Ball, W. W. R. Mathematical Recreations and Problems. 2d ed. Macmillan. $2.25.
Clemens, W. M. Mark Twain: his Life and Work. San Francisco: Clemens Publishing Co. 50 cents.
Curry, George. Merrill's English History for School and Home Use. Charles E Merrill & Co.
Dorland, W. A. N. A Cluster of Pearls for Christian Endeavor Workers. Boston: D. Lothrop Co. 75 cents.

New and Cheaper Editions for Present Exigencies.

WAGES.

A treatise on Wages and the Wages Class. By FRANCIS A. WALKER. 8vo, $1.75.

MONEY.

By FRANCIS A. WALKER. 8vo, $1.75.

HENRY HOLT & CO., N. Y.

JOHNS HOPKINS UNIVERSITY

BALTIMORE.

Announcements for the next academic year are now ready and will be sent on application.

MUSEUM OF FINE ARTS,

COPLEY SQUARE, BOSTON, MASS.
SCHOOL OF DRAWING AND PAINTING.
The Seventeenth Year will Open Oct. 3.

Courses in drawing from the cast and from life in painting and in decorative design, with lectures on anatomy and perspective. Principal instructors: F. W. Benson, E. C. Tarbell (Drawing and Painting), C. Howard Walker, J. Linden Smith (Decoration), Edward Emerson (Anatomy), and A. K. Cross (Perspective). Pupils are allowed the free use of the galleries of the Museum. For circulars giving detailed information, address Miss ELIZABETH LOMBARD, Manager.

New England Conservatory of Music.

Founded by Dr. Eben Tourjée. CARL FAELTEN, Director.

The most completely equipped institution in the world for instruction in all branches of MUSIC, ELOCUTION, FINE ARTS, LITERATURE, LANGUAGES, and TUNING, with valuable collateral advantages and an inviting home for 400 lady pupils. Next school year begins SEPT. 8. For Calendar address FRANK W. HALE, Gen'l Manager, Franklin Square, Boston, Mass.

NEW YORK LAW SCHOOL, 120 Broad way, N. Y. City.—"Dwight method" of instruction. Degree of LL.B. given after two year course. Graduate course now added. Tuition fee, $100. For catalogues, etc., address GEORGE CHASE, Dean.

Make Two Hundred

CAKES with Royal Baking Powder and every one will be whiter, sweeter, lighter, finer flavored, more delicious and wholesome than cakes made with any other baking powder.

The last spoonful in a can of Royal Baking Powder will be found as good as the first, and the last cake will be as light as the first, because the Royal has keeping qualities which all others lack.

A spoonful of Royal will go further than a spoonful of any other powder because it is the purest.

LECTURES ON RUSSIA,

By Miss Isabel F. Hapgood, author of 'Epic Songs of Russia,' translator of Russian authors, who has extensive knowledge of her subject from personal experience and travel. Profusely illustrated with Stereopticon Views. ST. PETERSBURG: Winter Life: MOSCOW: Types, Arts, ancient and modern; SUMMER LIFE: Nobility and Peasants: ARCHITECTURE AND CHURCH: COUNT TOLSTOY. For dates and particulars, address, care W. F. HAPGOOD, 154 Nassau Street, New York city.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make collections and issue Commercial and Travelers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

Horsford's

ACID PHOSPHATE,

Recommended and prescribed by physicians of all schools

FOR

DYSPEPSIA, NERVOUSNESS EXHAUSTION,

and all diseases arising from imperfect digestion and derangements of the nervous system.

It aids digestion, and is a brain and nerve food.

Descriptive Pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

Our new Book Catalogue not only gives the size and price of all the standard works on Homœopathy, but an interesting description of each, together with opinions of the press and of physicians. Mailed free.

BOERICKE & TAFEL,

Homœopathic Pharmacists and Publishers,
1011 Arch Street, Philadelphia.
Established in 1835.

Common Words Difficult to Spell.

A graded list of 3,500 words that experience has shown are most frequently misspelled. Dictation Exercises from Lowell, Hawthorne, Emerson, Irving, Addison, etc. Cordially endorsed by superintendents and teachers. Specimen copy, postpaid, 24 cents. JAMES H. PENNIMAN, 4322 Sansom Street, Philadelphia, Pa.

Foreign Books. Subscription to foreign periodicals, Tauchnitz British Authors. Catalogues on application. CARL SCHOENHOF, 144 Tremont St., Boston.

CATALOGUE NO. 34 WITH USUAL variety of interesting items, ready. A. S. CLARK, Bookseller, 34 Park Row, N. Y.

BACK NUMBERS, VOLUMES, OF sets of leading and scarce magazines, etc., for sale by H. WILLIAMS, 195 West 10th St., N. Y.

"The weary brain requires some nerve sustaining element as food."—HERBERT SPENCER.

Crosby's Vitalized Phosphites.

The vital principle of animal and vegetable life isolated from the ox brain and wheat germ.

The loss of memory, the tired and exhausted feeling, the dull, unrefreshed sleep, or nervous sleeplessness, brain weariness, depressed vitality, are simply the brain and nervous system calling for their necessary food. In this condition the Vitalized Phosphites give great relief. It restores the true protagon, the brain phosphoid, increases brain and nerve power by specially feeding the nerve centres. It reinvigorates brain and body.

For thirty years endorsed by leading physicians and the world's best brain workers. Formula on the label. Pamphlet free to those who write for it. Druggists or by mail, $1.00. 56 W. 25th St., N. Y. *F. Crosby Co.*

The Nation.

NEW YORK, THURSDAY, JULY 28, 1892.

The Week.

It is very much to be regretted that the House of Representatives, which is controlled by Democrats, should have passed a bill empowering the President to lay an embargo upon Canadian vessels passing through the St. Mary's Falls Canal. Whether there is any ground for an embargo at all we do not undertake to say, but if there is, it ought not to be left to the discretion of the Executive. One of the most objectionable features of the McKinley Act was that empowering the President to levy or remove duties in his discretion; and the dangerous character of the power was shown at once by the results of imposing a duty upon Venezuelan coffee, which caused an exportation of gold that we were ill prepared to meet. No doubt it will annoy the Canadian Government to have President Harrison forbid vessels owned by its subjects to pass through our canal, and it will no doubt injure the owners of these vessels. But it is well to consider that there may be other results brought about besides the gratification of spite, and that the sudden stoppage of an artery of commerce will have serious effects upon the market prices of grain and the rates of transportation. It is conceivable that a President of broad views and enlightened mind might exercise a discretion of this kind wisely and with advantage to the country, but such an executive would be the last to consent to be charged with such a power. As to President Harrison, it will scarcely be contended that he has displayed either a judicial disposition or a generous spirit in his international bickerings, and he has already written a most intemperate message upon the subject about which he is now empowered to exercise his discretion. The bill, which was passed in the Senate as it came from the House, "without explanation or discussion," is humorously entitled an act "to enforce reciprocal relations with Canada."

The objection was raised that this bill might be regarded as abrogating the treaty with Canada by virtue of which our vessels are permitted to navigate the St. Lawrence and to use the Canadian canals. To this, Mr. Blount of the Committee on Foreign Affairs rejoined that he did not know whether it would or not. Apparently he cared as little as he knew; and to the suggestion that it might be disastrous to American interests to annul a treaty upon which our navigation of the St. Lawrence depended, he replied that we could deal with that question when it arose. It would certainly be an awkward question to deal with now, for the interruption of this commerce would produce a convulsion in the grain markets of the world, and could scarcely fail to be disastrous to the farmers of the West.

The only ground for criticism upon the appointment of Mr. George Shiras, jr., of Pittsburgh to the vacant place on the Supreme bench is the fact that he has never had any judicial experience. There is a strong feeling that a seat in the highest court should come as the reward of proved capacity for such service on a lower bench. At the same time experience has shown that lawyers who have never had judicial experience often take the first rank when they are suddenly elevated to high judicial position. A notable illustration is Justice Gray of the United States Supreme Court, who was made Chief Justice of the Massachusetts Supreme Court without any previous service on the bench. Mr. Shiras is well known to his profession, and highly esteemed for the qualities which go to make a good judge. His appointment gives Pennsylvania a representative in the highest court for the first time since the retirement of Judge Strong on a pension in 1880. Mr. Shiras could not have had a more favorable introduction to a nation unfamiliar with his name than was furnished by Don Cameron's attempt to defeat his confirmation. There can be no stronger recommendation of a Pennsylvanian for the bench than the fact that one or other of the Pennsylvania Senators—they are emphatically "two of a kind"—does not like his nomination. Opposition from such a source is in itself a tribute to character.

It is a source of peculiar gratification that the most telling of all blows dealt at the Anti-Option Bill should have come from the representative of a cotton State. If, as now begins to seem probable, the Hatch Bill is to be speedily buried, the credit will be in no small measure due to Senator White of Louisiana, whose lucid argument of last Friday, all the more weighty because of his acknowledged familiarity with cotton production, left scarcely a shred to Senator Washburn's tissue of misstatements and fallacies. It is very possible, however, that the example of independence and honesty offered by the Louisiana Senator was more effective even than his explicit arguments. The measure never had a moment's chance of passing on its merits. The discussion in the House, hampered though it was by the preposterous application of the five-minute rule, was almost absurdly one-sided; but the speeches against the bill were shots fired in the air. Mr. Hatch merely invoked the farming interest, and every Representative with a farming constituency came meekly up to swell the bill's majority.

The Congressional Committee which conducted the inquiry into the affairs of the Pension Office has presented two reports to Congress, one from the majority, recommending "that Commissioner of Pensions Green B. Raum should be removed from office by the President," and the other from the minority, stating that the investigation exculpated Mr. Raum from all blame and showed that the efficiency of his bureau was of a high order. A sample of the defence is the statement that no evidence can be found to show that Raum, in his actions as Commissioner of Pensions, ever favored George E. Lemon, the claim agent, and that his relations with Lemon were perfectly proper. Even if the former assertion is true—and the evidence points the other way—does that excuse Raum? It is an admitted fact that Raum had as an endorser for his note of $12,000 this claim agent, who has a larger business than any other before the Pension Office. That it is not easy for Raum to borrow money is shown by the fact, brought out in the investigation, that John W. Thompson, President of the National Metropolitan Bank of Washington, and one of the most substantial business men of the city, refused to lend him $500 without an endorser. To attempt to explain this refusal on the ground of private enmity is absurd. Raum went to him as president of a bank, and Thompson refused to let him have the money because his credit was not good. It was palpably Lemon's interest to accommodate Raum, and it was palpably improper for Raum to be under obligations to Lemon. The episode by itself shows a moral obtuseness on Raum's part inconsistent with the qualities necessary for the proper administration of a bureau which disburses such enormous sums of money as the Pension Office distributes each year. It must be observed, too, that Lemon, whose testimony would have been so valuable, found it convenient to spend the winter in Europe, and his return a few days ago and the probable early adjournment of Congress are coincidences that it would be interesting to have explained.

The President's son comes badly out of the investigation into the Yellowstone Park scandal. Nothing criminal is charged against him, but many things highly indelicate and improper. It is plainly in evidence that he has hung about the departments to get appointments and contracts for personal friends. His function as an influential go-between was so clearly recognized by the "promoters" who wanted to oust the old contractor that they set apart $5,000 in stock for his benefit as only a natural reward for his services. The reluctant witness through whom this fact was brought out

said that he "did not know whether Mr. Harrison rendered the service or not, nor whether the stock was requested by him [the witness] to be issued for services or as a gift." Afterwards, he testified, the President's son "deprecated the issuing of it to him or for him." This affair would not be so bad in itself did it not come as the culmination of a long series of acts on the part of young Mr. Harrison by which he has assumed to have a mighty official influence and to be ready to use it for personal and political ends. He comes honestly by his willingness to use the public service for the good of his family, but he has shown a bumptiousness and pushing for notoriety which are all his own.

A difficulty occurred in the hall of the House of Representatives one day last week resulting from the attempt of one Devlin, who calls himself "Executive Committee of the Knights of Labor," to instruct Judge Oates, Chairman of the House Committee investigating the Homestead troubles, how he should conduct the investigation. This attempt was not particularly successful or encouraging to a repetition of the same, and it resulted in the ejection of Devlin from the hall. Now Mr. Devlin has given his version of the affair to a representative of the United Press, and it confirms substantially the report as first published. The difficulty arose in this way: Devlin wanted to interrogate the Pinkertons at great length regarding the sending of their men to Homestead, and also as to the business carried on by the Pinkertons both now and heretofore. These questions covered a vast deal of ground and called for statistical information which could not be given off-hand. They also involved abstruse questions of law. They were presented on typewritten paper. The Committee consented to adopt the questions as a part of the examination, and then took an adjournment in order that the members might go into the House and vote on a pending bill, the written questions being turned over to the Pinkertons for answer. Now it appears from the statement of Devlin that his grievance consisted in the fact that the Pinkertons were allowed time to prepare their answer. His idea of the fitness of things was that the Pinkertons should have this long string of questions put to them suddenly, so that they might be thrown into confusion if possible—not being ready with an answer in every case. This grievance so weighed upon Devlin's sensitive nature that when the Committee met again, he accused Judge Oates of purposely making an adjournment in order to give the Pinkertons time to prepare their answers. That was not true, and Devlin's impudence in making such a charge led to his being called a liar. It seems never to have occurred to him that it would have been a perfectly proper thing for the Committee to give the Pinkertons time to prepare truthful and intelligible answers, and to adjourn for that express purpose.

The reply of the Pinkertons to the various charges and the violent abuse heaped upon them since the Homestead rioters unlawfully attacked and wilfully murdered several of their number, has been published. It shows that they were, at all the stages of the Homestead proceedings, pursuing a lawful calling, by lawful means, and that they were attacked by the rioters before they had even taken up the arms and ammunition that had been sent in boxes for their defence against attack. Yet for two weeks past the public ear has been filled with outcries against the Pinkertons as though they were a tribe of barbarian invaders intent upon sacking peaceful homes. A Senator of the United States, who is also a lawyer, has charged upon them the crime of treason, which consists only in levying war against the United States or in adhering to their enemies, giving them aid and comfort. The whole question involved in the employment of the Pinkertons is whether the owners of property have a right to protect it. Everybody knows that the Pinkertons are employed as watchmen only in cases where the public authority is dilatory in affording protection. People whose property is in danger of attack and who are prevented by violence from having access to it, would always prefer to have public rather than private guards to protect them. The cost of the former is paid by the whole community, while that of the latter falls on the individuals who hire them. Moreover, the public guards, being in overwhelming force, are seldom resisted, while the Pinkertons are always resisted, and sometimes, as in the present case, overpowered and infamously maltreated. The affair at Homestead teaches the lesson very clearly that the way to abolish the Pinkertons is to abolish the need of them.

The attempt to assassinate Mr. Frick is a natural result of the attitude taken by the Homestead strikers. His assailant appears to be one of those "cranks" whose mental weakness makes them the easy prey of the preachers of anarchy, and whose love of notoriety is quite as strong as any desire to help the cause of "Labor." There seems no ground for supposing that the Homestead men had any direct connection with his crime, but the leaders who organized the attack upon the Pinkertons three weeks ago, and who have never expressed any regret for the act, are morally responsible for Berkman's performance. The leaders of the strike attacked the watchmen sent by the manager of the mills, and killed as many of them as they could; he simply tried to kill the manager who sent the watchmen. If it was right to murder the Pinkertons—and nobody among the strikers, from O'Donnell down, has ever admitted that it was wrong—it was right and logical to try to kill the employer of the Pinkertons.

The weakness of the strikers' position has never been so fully exposed as in the pronunciamiento of the "Advisory Board" which appeared almost simultaneously with the attempt to murder Mr. Frick. "Capital" has never presented so one-sided and illogical a claim as this declaration of "Labor" that all the obligations in the relation of employer and employee are on the part of the former; that, while the employer cannot hold the employee in his service an hour longer than the latter is satisfied, the workingman has the right to demand continuous employment at wages which he himself fixes. All that is necessary to show the fatal weakness of such an assumption is that people shall stop and think about it, and Berkman has made this certain. It is easy to talk about arbitration of labor disputes, but there can be no arbitration when one side takes such a position as this and declares that it will never abandon it. If the Carnegie firm had announced that the condition precedent to any arrangement was an agreement by their employees to remain permanently in their service, the workingmen would have rejected the proposition as absurd and the public would have sustained the men in refusing it. In like manner the employer must reject the proposition that the workingman has a right to remain continuously in his service while owing a higher allegiance to the Amalgamated Association or any other authority, and the public will sustain him. The real trouble at Homestead is that the Almagamated Association has become an intolerable tyranny. Mr. Carnegie himself has more than once yielded to unreasonable demands from it, when other employers, less anxious to curry favor, were ready to stand out against it, O'Donnell and his associates evidently thought they needed only to "put on the screws" and they could extort what they wanted once more. Mr. Frick recognized that the time had at last come when there must be a change, or else the management of the mills must be turned over to O'Donnell & Co.

Among the new men who have made a mark in the present Congress there is not one who takes a higher rank than Mr. Michael D. Harter of Ohio. Mr. Harter is a business man and a manufacturer who unites practical knowledge with theoretical training, and who in addition has first-rate debating powers and undaunted courage. Such men are rare everywhere. When found, they ought to be kept in Congress or promoted to higher positions. Mr. Harter has been gerrymandered into a strong Republican district, but he is not going to pass out of public life without a fight. It is to be hoped that the people of the new Fourteenth District will have some

local pride in a Representative who has taken so honorable and praiseworthy a position as Mr. Harter occupies, having achieved a national reputation in a brief space of time and without adventitious aids, by sheer force of ability and with an eye single to public interests.

News comes from Georgia that the third-party people propose to make a dead set at Speaker Crisp, and, if possible, prevent his reëlection to Congress. His district is said to be greatly tinctured by the doctrines of the People's party, and a strong candidate has been named against him. Congressman Watson, the Alliance leader from Georgia, announces his intention to stump the Third District against Mr. Crisp, and to fight him at every point. All this is interesting as showing that the Speaker, in his efforts to conciliate the crazy sentiment of his own district and State, has really accomplished nothing except to bring his party into the greatest peril. He has simply been one of the many members of this Congress who have preferred to sacrifice the party to their own supposed interests, his position as Speaker making his example especially conspicuous and pernicious, just as it has made his disregard of the general party interest the more inexcusable. If he has now learned the old lesson that political lunacy can never be placated by half-way concessions, but must be fought and crushed from the start and all the way through, his experience w ll be of some value to him and probably to the country.

The Treasury's report of gold exports and imports for the fiscal year (to June 30, 1892) shows, somewhat contrary to the general belief, that we have received from abroad during that period within $500,000 as much gold as we have sent out. As the annual gold product of our mines averages about $33,000,000, and the annual consumption of gold in the arts about $14,000,000, it follows that there is something like $18,000,000 more gold in the country now than there was a year ago. In seven out of the fourteen years since 1878, we have imported more gold than we have exported, and our net gold import balance for the whole period is fully $100,000,000. But it may be profitable to notice that the greater part of our net imports of gold came in 1880 and 1881. These were the years of specie resumption and the reinvestment of European funds in American securities. They were preëminently the years of foreign confidence in the stability of our national finance; a confidence due to the wise measure of resumption, and attended, not alone by the investment of Europe's money in our enterprises, but by the depositing on this side of large credit balances for use in either our loan or security markets. The recent phenomenon of our gold exports has brought into relief one impressive fact, that the juggling and tinkering with our currency at Washington has done much to destroy this confidence, and to encourage foreign creditors in drawing out and carrying off their American balances the moment they can discount their bills receivable on the exchange market. People are in the habit of calling these exports abnormal. On the contrary, they are as normal as the usual action of any cautious depositor whose bankers have been distinguishing themselves by financial recklessness.

The prospectus of a Divinity School just founded at Boulder, Col., reveals a novelty worth attention. The School is to be non-sectarian, not only in the sense of being under the control of no particular denomination, but also in the actual representation and coöperation of representatives of several different denominations in its direction and teaching. Of the Faculty so far as chosen, two are Baptists, two Episcopalians, and one is from each of the following churches: Congregationalist, Disciple, Presbyterian, Unitarian, and Universalist. Such a union of diverse elements for the work of theological education is probably unexampled in this country or any other, and must be taken as a striking proof of the decay of the sectarian spirit. Its occurrence in the West makes it all the more notable, as denominational prejudices are always strongest in a new country.

The London *Lancet* publishes the proceedings and debate which took place at a meeting of the Society for the Study of Inebriety, on the subject of the Bichloride of Gold Cure, the headquarters of which are at Dwight, Ill., and the high priest of which is Dr. Keeley. The chairman of the meeting said that a project was on foot to start the bichloride of gold business in England on a large scale, a syndicate having been formed to raise £150,000 as a working capital. The Society had thus been induced to look into the subject. The first thing done was to procure a bottle of the Keeley remedy and analyze it. The analysis showed that it contained no gold and no chlorides. It consisted of water 61 per cent., sugar 6 per cent., alcohol 27 per cent., together with some mineral salts, principally lime. The whole decoction was a liquor as intoxicating as port or sherry. Dr. Usher of Melbourne, Australia, described a visit that he made to Dr. Keeley's sanatorium at Dwight. He said that Dr. Keeley seemed very uneasy while he (Usher) was asking questions concerning his remedy and mode of treatment, and referred him to his "chemist," who was a boy in the Doctor's employ. The meeting adopted a resolution declaring that any so-called "cures" for inebriety the composition of which is not disclosed, are unfit to be commended by honorable members of the medical profession; also, that the contents of the bottle that had been analyzed, and which purported to be bichloride of gold, were unfit for the medical treatment of inebriates and should be unreservedly condemned.

In the Buenos Ayres *Standard* of May 31 is published a copy of a letter addressed on December 24, 1891, to the United States Minister in the Argentine Republic by the Minister for Foreign Affairs of that country. It relates to the question of reciprocal trade, and is a reply to various notes and verbal communications of our Minister on that subject. The point of the answer is, that the Argentine Government cannot afford to surrender any of its customs revenues unless the United States should offer the equivalent of a free market for Argentine wool, and that, if a duty is laid on Argentine hides, under the terms of the McKinley Bill, retaliation will be made in the shape of an extra duty on American lumber. A highly significant fact is brought out in the letter:

"Your Excellency intimates," writes the Foreign Affairs Minister, "that, should these negotiations not be accepted, President Harrison will enforce the McKinley Act, suspend the free importation of Argentine hides, and enforce the duty of 10 per cent. ad valorem."

If the President authorized such a threat, then he has violated the law by not fulfilling it. Section 3 of the McKinley Bill says that "whenever and so often as the President shall be satisfied" that duties which "he may deem to be reciprocally unequal and unreasonable" are levied by another government on our exports, "he shall have the power and *it shall be his duty* to suspend," etc. Now, it is clear that the process of "satisfying" and "deeming" which the law contemplates as going on in the President's mind, must have been completed at the time he made the threat above recorded. If so, it was his sworn "duty" to go ahead and enforce the law regardless of threats of counter-retaliation, and without the fear of New England shoe-manufacturers before his eyes.

Brazil has been having her own troubles from riots and insurrections, and the President has had to call out the troops on several occasions and declare martial law. His exercise of discretion in that way has been called in question in some quarters, and a bill has been introduced by one Congressman to make it unlawful for the military to be called out to suppress a riot unless the rioters shall number 10,000. There may be a suggestion here for our own labor-legislators. We presume that such a provision would be entirely acceptable to the riotous miners in Idaho, or to the Homestead strikers. Indeed, we suppose that strikers who were anywhere trying by force to prevent other men from working would be ready to certify their numbers to the Governor, if such a law were passed, and to guarantee them to be less than 10,000. To make the law perfect, however, it would be necessary to provide that no more than 5,000 troops should ever be brought against the 10,000 rioters.

MR. CLEVELAND IN NEW YORK.

THE official Democratic notification ceremonies in the Madison Square Garden on Wednesday evening of last week mark an innovation in campaign methods, the custom hitherto having been for a committee appointed by the National Convention to meet the candidate in his home or office. Politicians of both parties have awaited the result of this new departure with no little curiosity, as upon its success or failure may depend the practice of both parties in future. We think the general conclusion will be that it was a great success. There is a certain appropriateness in allowing the masses to witness a ceremony of so much significance, instead of restricting the attendance to the few party leaders who are all that can be admitted to the ordinary parlor or office. As regards the partisan aspect of the affair, it must materially help in giving the Democratic campaign a good start. It demonstrated more conclusively than ever the hold which Mr. Cleveland has won upon the masses of the people—the hold by means of which he secured two-thirds of the delegates to the National Convention, despite the best-laid schemes of the professional politicians of his party. It showed that this hold was especially strong in New York city, where the opposition of the professional politicians to his nomination was most pronounced. The truth is, that there is no place where Mr. Cleveland is stronger among the business classes and the laboring men than in the metropolis, as the election returns of this city next November will conclusively demonstrate.

Mr. Cleveland's speech was appropriate to the occasion—dignified, forcible, and frank, like all of his utterances. The Democratic platform declares that "the Federal Government has no constitutional power to impose and collect tariff duties except for purposes of revenue only." Mr. Cleveland, in his speech, touched upon this subject in the following words:

> "We oppose earnestly and stubbornly the theory upon which our opponents seek to justify and uphold existing tariff laws. We need not base our attacks upon questions of constitutional permission or legislative power. We denounce this theory upon the highest possible grounds when we contend that in present conditions its operation is unjust, and that laws enacted in accordance with it are inequitable and unfair."

The Republican newspapers are seeking to turn the tariff discussion on the question of constitutionality, as though, if it were once proved that a tariff for other purposes than revenue was constitutional, the battle was already won. We think that Mr. Cleveland has taken the right position on this question, and that it is not in any way out of harmony with the platform of his party.

A question somewhat similar has been raised in the discussion of the Anti-Option Bill now pending in the Senate. This bill purposes to drive out of business certain persons engaged in a lawful trade—*i. e.*, those who buy and sell grain, cotton, and provisions for future delivery, by imposing upon them a special tax. This tax is intentionally put so high that it will not yield any revenue. To whatever extent it produces an income to the Government it will fail of its purpose, which is to prevent option trading altogether.

Now, this bill is assailed as unconstitutional, and justly so, for if it be constitutional to extinguish one trade or calling by law, any other may be uprooted in the same way whenever a majority can be found to apply the axe to it. Our Constitution was preëminently designed to protect the rights of the minority. The many can always protect themselves, but the few require the safeguards of the fundamental law. This Anti-Option Bill is certainly unconstitutional in the sense that it violates the spirit of the Constitution and invades private rights in a dangerous and outrageous manner. Yet the Supreme Court held in a parallel case that the judicial power could not inquire into the intentions of Congress in imposing a tax, and that if injustice had been done, the only remedy was in an appeal to the legislative power which had inflicted it. This was in the case involving the 10 per cent. tax on State banknotes. The court held the tax to be not unconstitutional. Therefore, it is constitutional, according to the decision of the highest tribunal, and every citizen is concluded by it so far as his overt acts are concerned. But is anybody concluded by it as regards his opinions and his political action? Clearly not. Everybody is at liberty to say that he considers the tax on State banknotes, and the tax on oleomargarine, and the proposed tax on option trading unconstitutional.

We find the highest authority for this view in the celebrated debate between Lincoln and Douglas. Mr. Lincoln held that the Dred Scott decision, although pronounced by our highest judicial tribunal, was not binding upon the minds and consciences of the people. A large part of his argument in that Senatorial campaign was directed to the point that the public ought not to acquiesce in that decision, but ought to protest against it and vote against it at every opportunity. He admitted that as an inhabitant of the United States he was bound to submit to all its laws as interpreted by its courts. He would not resist the officers of the courts, however mistaken and erroneous he might think their rulings to be, but he would not allow them to bind his conscience or his political action. Douglas denounced Mr. Lincoln's position and accused him of inciting rebellion against law and Constitution, but Mr. Lincoln overthrew him completely by showing that he (Douglas) endorsed and stood upon a political platform which declared that Congress had no constitutional power to charter a United States bank, whereas the Supreme Court had previously decided that Congress had that power.

From these examples, which ought to be current coin in Republican circles, it may be seen that no inconsistency can be charged upon those who hold that a tariff levied for other purposes than revenue is unconstitutional, even though there be an unbroken line of judicial decisions to the contrary. Of course the courts will not give a decision which would bring the functions of government to an end by stopping the collection of taxes. All that need be said by anybody is, that in his political action he holds certain opinions; and that while submitting to the laws, he seeks to make his opinions prevail in the affairs of government. That is every man's right, and civil liberty rests upon the constant exercise of it.

Mr. Cleveland said nothing on the silver question, for the very good reason that there was no occasion for saying anything. There is no issue between the candidates of the two parties on this question, and everybody recognizes that there is none. The strongest advocates of free coinage in the Democratic party admit that there is no hope for it if Mr. Cleveland is elected, and the strongest opponents of it among Republicans confess that there is no danger of such legislation in case of his success. Since the defeat of the Free-Coinage Bill in the House, nobody takes any further interest in the question as a practical matter, and it is relegated to the limbo of dead issues for this campaign.

CUSTOM-HOUSE STATISTICS.

WE are now sailing so very close to the wind in the matter of our gold reserve that it is not a little disquieting to read, in a note contributed by Mr. G. O. Virtue to the *Quarterly Journal of Economics*, that the official returns of gold shipments are of questionable accuracy. In the case of Italy, Prof. Ferraris pointed out that the figures returned by the railway and steamship companies and the banks in 1885 showed imports of the precious metals 15 per cent., and exports 38 per cent., greater than the amounts returned by the custom-houses. In 1886 the discrepancy in the case of imports was only 7 per cent., but in the case of exports it was 82 per cent. A comparison of the French and English statistics for the fourteen years from 1871 to 1884, made by Soetbeer, showed that the French account of what was received differed from the English account of what was sent, on the average, by 25,000,000 francs, while the corresponding difference in England was 44,000,000. In our own case the Director of the Mint declares his belief that a great deal of gold is brought into the country of which the Custom-house knows nothing, although his reasoning is not very satisfactory. Mr. Virtue goes somewhat deeper into the matter, and has compared our exports and imports of gold for the last five years to and from England with the corresponding returns made in that country. Of course these tables ought to balance as closely as the opposite sides of an account in book-

keeping by double entry, for they purport to record the same transactions, with no difference except in name, as the value of gold is the same wherever it is.

Instead of this being the case, we find that the most inexplicable discrepancies exist. Our figures show that during these five years the United States shipped $76,249,990 to England, while the English figures show that during that time they received from the United States only $73,613,850, so that $2,635,940 was lost on the voyage. On the other hand, the English claim to have sent over here $28,672,187, while we acknowledge the receipt of only $19,997,138. This is the amount of variation for the term of five years, but the variations during shorter periods, which are usually taken by financial journals for purposes of comparison, are both great and numerous. Thus, the English statistics show that from June to October, 1887, over $8,000,000 was sent to the United States, while our statistics show the arrival of only $4,000,000. Mr. Virtue has done well to call attention to this comparison, but he would have rendered the financial world a much greater service if he had gone to the bottom of the matter and stated the manner in which the precious metals are actually transferred from one country to another, and exactly how, when, by whom, and to whom returns of these transactions are made. When we have this information, and when the Treasury and the banks discriminate precisely in their returns between the various kinds of currency which they hold, we shall know where we stand financially much better than at present.

It is, unfortunately, by no means the case that Custom-house figures concerning the movements of the precious metals are peculiarly untrustworthy. On the contrary, as these metals are seldom subject to duty, there is less reason for undervaluing them than other merchandise, while the simplicity of their nature prevents uncertainty as to their price. It is not surprising, therefore, that discrepancies exist between the Custom-house returns of imports and exports of different countries to such an extent as to justify the old reproach that nothing lies like figures. At the time of the economic rupture between France and Italy, both the representatives of the Governments and the financial publications were for some time unable to reconcile the accounts of the trade between these countries that were furnished by their respective customs authorities, owing to different methods of classifying certain articles. Every country, it may be said, has its own methods of book-keeping as well as of levying duties, and before any trustworthy inferences can be drawn from comparing the returns of different countries it is necessary for the statistician to familiarize himself with numerous details.

The delusive character of the Custom-house figures even of a single country is illustrated by the *Économiste Français* in the case of French exports of linen yarns. According to the report of the Custom-house, there were exported of these goods to Belgium over 8,000,000 kilogrammes, to England 1,775,000, and to Spain but 5,300. It is plain that the statesman who undertakes to regulate trade on principles of reciprocity would consider the trade with Spain of very little consequence, and that with England as of much less importance than that with Belgium. But, as a matter of fact, a great part of the export to Belgium is really to England, the goods being merely transmitted by Belgian railways, and the same is true of the Spanish trade, large quantities of these goods, after undergoing further processes of manufacture, passing back from Belgium through France on their way to the Spanish market.

The Secretary of the Chamber of Commerce at Lyons has recently published a book upon the French exports of silk which affords additional illustration of this uncertainty. These exports amounted in 1859 to 499,000,000 francs, but in 1861 they fell to 333,000,000, while the imports increased. Naturally the French protectionists cried out that the silk trade was ruined by the free trade of the Cobden-Chevalier treaty, and the coincidence was sufficiently startling to justify their alarm. But the explanation of the reduced figures was easily supplied. In fact, there was an actual reduction of silk exports, for the distress occasioned in this country by the outbreak of the civil war reduced our imports of silk from 111,000,000 francs (their average value from 1855 to 1859) to 25,000,000 francs in 1861. But at the same time there was a change in the mode of valuation at the Custom-house, the net weight being taken as a basis instead of the gross as formerly. When we consider that ribbons were commonly wound upon blocks of wood, it is not surprising that the valuation of this wood as silk had caused the export of ribbons from France to be returned by the Custom-house as greater than that of the entire product of St.-Étienne.

The book to which we have referred contains many other illustrations of the pitfalls in the way of those who would reason from official figures, which it is unnecessary for us to quote. There is nothing that is more generally handed over to Government than the collection of statistics, and there is probably no part of its work which it does so ill. It is not very satisfactory for private persons to do work for themselves when they have paid the Government their money to do it for them, but we apprehend that chambers of commerce will eventually have to make the procuring of accurate information a more prominent part of their work if they are to preserve their usefulness. When it is considered that a statistical investigation, to be of value, must be conducted with the same rigid regard to the rules of inductive logic as a chemical research, the folly of reasoning closely from figures gathered by a professional politician, like the present Superintendent of the Census, is evident enough. So far as the quantity of statistics goes, no government ever furnished them to its subjects with greater liberality than our own, but no amount of misinformation can outweigh a single grain of truth. Quality is the desideratum in figures, not quantity.

THE DOUBTFUL FARM VOTE.

EIGHT farm organizations have become more or less merged in the present "People's party," all or nearly all of which have positively denounced the high-tariff policy of the Republican party. That circumstance alone makes clear the direction in which the prevailing farm unrest, especially at the West, is moving. We know, too, perfectly well what uneasiness the farm movement is giving the Republican leaders, and what hope to the Democrats in States which up to a very few years ago were reckoned stanch in their devotion to the Republican party. We cannot now say positively how those States will turn next November, but we can indicate, by aid of the census and recent election returns, how slight are the forces needed, when they act on the immense farm vote, to shift the balance of power in many of them. In the whole nation very nearly one-half of our 12,000,000 voters come from the "unprotected" farm.

Using the ratios of occupation as derived from the census of 1880, and applying them to the large vote thrown at the last election for President (except as to South Dakota) in each of the nine States named, we obtain approximately the following table:

	Whole vote.	Farm vote.
Illinois	747,686	367,004
Indiana	536,949	303,270
Iowa	404,140	251,566
Kansas	334,035	225,910
Michigan	476,273	215,994
Minnesota	263,306	151,698
Nebraska	202,632	128,430
South Dakota	77,607	41,035
Wisconsin	354,614	185,464
Total	3,397,242	1,870,371

In obtaining the table by carrying out the ratios for occupation, we have ignored some of the smaller fractions, and in the case of South Dakota have taken the vote at the State election of 1890, deriving the farm vote from the farm ratio of occupation for 1880 in the old Territory of Dakota. If the comparison could be made for the nine States on the basis of the vote and occupations of 1892 and 1890 respectively, the change would be little if any against the farmer, the growth of cities and large towns in States like Illinois, Indiana, Michigan, and of the two large cities of St. Paul and Minneapolis being largely offset by the numerical increase of the farm vote in Kansas, Iowa, Nebraska, and South Dakota. It will be seen that in

every one of the nine States, except Illinois and Michigan, there is a clear majority of the farm voters, their majority in the nine States being 343,500, and their ratio to voters in other occupations being more than 18 to 15. In most of the nine States cited the farm discontent is pretty active, and in several of them the Alliance has been exceedingly strong, two of them being now represented by members of that body in the Federal Senate. In all of the nine States, moreover, the farms, as a rule, are so far from factory towns, and the States themselves so remote from the East, that even the high-tariff "proximity" sophism as to the neighboring factory and farm loses, not its strength, for it has none, but all its speciousness as a campaign weapon.

Let us take the record of these nine States in detail. The State of Illinois, on the basis of the Republican plurality of four years ago, would require a change of only about 1 farm vote in 33 farm votes to give her electoral vote for Cleveland. Since 1888 she has gone Democratic and chosen a Democratic Senator. Indiana needs a change of 1 farm vote in about 258 on the basis of the vote of 1888, and since then has gone Democratic by 19,579 plurality. One farm vote changed in about 16 would give Iowa to Cleveland on the 1888 vote, and twice since then she has chosen a Democratic Governor. Kansas would need a change of about 1 farm vote in 11, but since 1888 her Democrats and Farmers' Alliance men combined have outvoted the Republicans by an immense majority. Michigan, under her new plan, will probably divide her electoral vote about evenly between Cleveland and Harrison. A change of 1 farm vote in about 8 would give Minnesota to the Democrats on the basis of the last Presidential election, and since then the Democrats and Alliance men united have run ahead of the Republicans some 55,000 votes. In South Dakota the situation is much the same, and Wisconsin needs a change of but 1 farm vote in about 18 to give Cleveland a plurality, reckoning on her last Presidential vote. Since then she has chosen a Democratic Governor by 28,320 plurality, and also a Democratic United States Senator.

Certain other disturbing forces cloud the result this year in these nine most distinctive farm States. For one thing, it will be noticed that the farm discontent, which used to appeal to the State Legislature for redress, has, during the past four years, turned as never before to the Federal Government, an awakening to the nature of the tariff abuse being one prominent incident of the change. Add other facts, mechanical, economic, and sentimental, such as "fusions," the silver heresy, the discontent of the Blaine men, secret-ballot laws, and we can understand why, for the first time since the civil war, the Republican strongholds of the West and Northwest—saying nothing of Ohio, Massachusetts, New Hampshire, and Rhode Island—are beginning to shake. Their fall may not come this year, and, as a mere question of political chances, New York may still hold her old place as the "pivotal" State. It remains true, nevertheless, that never, for many years, has the situation in the group of "farm States" been such as to create and to justify greater Republican anxiety. This is the case whether the Alliance men hold their strength, or whether, as seems far more likely, their organization fails and its voting elements drift to the party of tariff reform.

WHAT HOME RULE HAS COST THE LIBERALS.

THE general election of 1885 was the last before Mr. Gladstone made home rule for Ireland a part of the Liberal programme. The contest of 1886 did not show with certainty what the mature judgment of the country upon the new policy would be, although it proved beyond question that at first sight the voters did not like it. As a consequence of its adoption, a Liberal and Nationalist majority of more than half a million in the votes polled in 1885 was turned into a minority in 1886. The Liberals lost nearly half the English, a third of the Scotch, and a seventh of the Welsh seats they had carried only eight months before. In the House of Commons a Unionist majority of 120 replaced a Liberal and Nationalist one of 168. Still, it was quite possible to argue, as the Home-Rulers have argued, that many of these losses might have been due merely to the confusion and hesitation among the Liberal voters naturally resulting from so sudden and radical a change of front and the secession of so many prominent party leaders. It was not improbable that when the people had become familiar with the Irish side of the question, and when the dissatisfied Liberals had learned from experience that, as political conditions actually were, the only choice left them was between home rule and a Tory Government, they would decide to waive such objections to an Irish Parliament as they still had, and to support the nominees of their old party. It is therefore in the results of the election of 1892 rather than in those of 1886 that the effect of Mr. Gladstone's Irish proposals upon the relative strength and distribution of parties can most profitably be studied.

In making comparisons between 1885 and 1892 it must of course be borne in mind that under any circumstances a good many changes will take place in seven years. Subordinate and local questions always obscure to a greater or less extent the real verdict upon the main issue. The desire of a portion of the workingmen for an eight-hour law, the general disorganization and disturbance following the great strikes in the north of England, the stimulus which the discussion of local grievances in the London County Council has given to radicalism in the metropolitan constituencies, the fear of disestablishment among the voters of the Kirk of Scotland, and the desire for it among Welsh Nonconformists, have all doubtless played their part in attracting or repelling votes. For six years, however, home rule has been the burden of nine political speeches out of ten. The newspapers have discussed it in its every aspect. During the late campaign all the prominent leaders on each side did their best to keep it to the front, and probably the sense of the country has been taken upon it as accurately as the sense of the country ever is or can be taken upon anything.

Comparing 1885 and 1892, it is obvious that the adoption of the home-rule policy has cost the British Liberals much. Allowing for the uncontested constituencies, the Unionist gain in the popular vote has been between 350,000 and 400,000 votes. The Liberals have lost votes (although not always seats) in every portion of Great Britain except in Wales and in the northwestern and in one or two of the eastern counties of England. The Liberals now carry fifty-eight less British seats than in 1885, and, among British members, are in a minority of fifteen instead of having as formerly a majority of no less than 101. These are, of course, net losses. As the bye-elections indicated, there are a number of former Conservative constituencies in which the Liberals have gained strength in the last seven years. In some of these, in which the Irish vote is a considerable factor, the increase has been due to the home-rule issue. In others, where social or economic questions have interested the working-class, it has been rather in spite than because of its position on Irish government that the Liberal party has made votes. Whatever the cause, however, the Liberals have this year returned their candidates for one Welsh, three Scotch, and thirty-seven English constituencies in which Conservatives were successful in 1885. On the other hand, Conservatives and Unionists win fourteen Scotch and eighty-five English seats for which Liberals sat in the Parliament of 1885.

The gains and losses have been very unevenly distributed geographically. In Wales, which has national aspirations of its own, the Liberals have lost nothing by taking up the cause of home rule. They have even somewhat increased their popular majority, and have taken from the Conservatives one of the three seats carried by the latter seven years ago. In Cumberland, Westmorland, and Lancashire, making up the northwestern corner of England, the Liberals have gained thirteen Tory and have lost but eight Liberal seats. In the eastern and northeastern counties, although the Liberals are on the whole considerably the losers in the popular vote, they hold their own fairly well in seats, their net losses being but five. In London the Unionist majority in the popular vote, thanks principally to the increased Conservative poll in the

outlying portions of the Metropolitan district, is somewhat greater; but, exclusive of the University, which Sir John Lubbock carries over to the Unionists, they elect one member less, suffering a net loss of three seats on the south or Surrey side of the Thames, and making a net gain of but two in Middlesex. Outside of London, the southeastern counties sent but 12 Liberals, as against 63 Tories in 1885, and they now send but 8, against 67 Unionists. On the whole, however, the Liberal strength in England, except in those counties which lie south of the Mersey and west of a line passing through Warwickshire, has not been very seriously impaired. In 1885, exclusive of the counties referred to, the Liberals elected 166 members and the Conservatives 179. In 1892 the numbers stand: Liberals 159, Unionists 186. These portions of England return more than half the entire House and about three-fifths of the British members, and in them the net Liberal loss since 1885 has been but seven seats.

It is in the Western Midlands, in the West and Southwest of England, and in Scotland that the great changes have taken place. From the Mersey to the Channel and from the borders of Derbyshire to Land's End there were returned in 1885 78 Liberals and 37 Conservatives. In 1892 the Liberals lost 46, or more than four-sevenths, of the seats they carried in the earlier year, while winning but six seats from the Conservatives. In other words, the position of parties in the West and Southwest of England is now reversed. The Unionists have 77 members and the Liberals but 38. More than two-thirds of the entire Unionist net gains have been made in this portion of England, although it returns only about a fifth of the British members. Mr. Chamberlain's influence is evidently as strong as or stronger than ever. In his home counties of Warwickshire and Staffordshire the Liberals in 1885, when he was the hope of the Radicals and the dread of the Tories, carried twenty-six out of the thirty-one seats. Now they get but eight, or one less than they saved from the deluge of 1886. In Birmingham itself and in some of the neighboring constituencies more than half of the entire Liberal vote has followed Mr. Chamberlain into the Unionist party. In that neighborhood the resulting change of political strength is as great as would be required to make Vermont a Democratic or New York city a Republican stronghold.

In Scotland, too, although the overturning, when compared with 1885, is by no means proportionately as great as it was in the Birmingham region, the Liberal losses are at once very heavy and very significant. They have lost 14 of the 62 seats held by them in 1885, and have captured but three of those which returned Tories in the last-named year. The changes in the relative strength of the votes polled by the Liberals and their opponents is, however, the most significant result of the Scotch polling. In 1885 the Liberal predominance in most parts of Scotland was overwhelming. Exclusive of the Universities, there are seventy Scottish seats. Of these in 1885 the Conservatives did not contest thirteen at all, and in each of fifteen others the Liberals had more majority than the Conservatives had votes. Now this is all changed. There was a Conservative or a Unionist candidate for every seat in Scotland, and in but six of the whole number were the Liberals able to poll two votes for one. Comparing the vote in the constituencies contested by Conservatives in 1885 and by Conservatives or Unionists in 1892, it appears that the Liberal vote fell from 241,093 to 216,404, while the Unionist rose from 151,691 to 182,551, thus cutting the Liberal majority of nearly 90,000 in 1885 down to less than 35,000 in 1892. The Liberal losses in particular constituencies were proportionately still greater; and, curiously enough, with the single exception of West Aberdeenshire, the greatest numerical loss was sustained by Mr. Gladstone himself in Midlothian. Scotland, of course, is still a Liberal stronghold, and that party elects more than two-thirds of the total members for the kingdom; but the party has now, as it formerly had not, a more or less well-organized foe in nearly every constituency, and in future the Scottish Liberals, if they wish to hold the seats to which they are entitled, must abandon the running of two or more Liberal candidates for the same place—an amusement to which they have been much given in the past.

The chief interest in the Irish elections of course turned on the showing the Parnellites might be able to make. The result proves that in the greater part of Ireland they are without strength. In Dublin city and county they poll two votes to their rivals' one, and carry four out of the six seats, the other two falling to the Unionists, who also gain three more seats in Ulster. Outside of Dublin the Parnellites elect members only in Waterford city, Clare, Roscommon, and Galway, and usually by majorities small as compared with those by which, as a rule, their nominees (when they had them at all) were beaten. An analysis of the returns reveals the fact that while there are Protestant Home-Rulers, a number of whom have seats in Parliament, every one of them has been elected almost exclusively by Catholic voters, for every one of the sixteen constituencies in which the Protestants are in a majority of the population return Unionists. Among the wealthier and professional classes there are probably a considerable number of Catholic Unionists, yet Nationalists of one faction or the other will sit for eighty out of the eighty-five constituencies in which Catholics are more numerous than Protestants. In three of the five exceptions, the Catholic majority of the population is so small that it is not improbable that there may be a Protestant majority among the registered electors, while the election of Unionists for the St. Stephen's Green Division of Dublin city, and for the South Division of Dublin County, was in the former case certainly, and in the latter probably, due entirely to the factional fight which divided the home-rule electors.

PROHIBITION IN MAINE.

PORTLAND, MAINE, July 7, 1892.

A WEEK'S sojourn in this, the principal city of Maine, has given me an opportunity to study the working of the Prohibitory Law.

This law has been on the statute book of Maine for the last forty years (except that I believe it was repealed for two years shortly after its first enactment), and has constantly been amended in the direction of greater severity, so that it would seem that the most fanatical prohibitionist could ask for nothing more in the way of legislation, unless, indeed, the sale of liquor should be punished with death. The punishment for the sale of a single glass of liquor, even for the first offence, is fine *and* imprisonment for thirty days, the court having no power to modify this part of the punishment. There is an absolute prohibition upon the manufacture of intoxicating liquor for sale, upon the taking of orders for the sale of liquor by men travelling from place to place, upon the transportation of liquors with intent that they shall be sold by any person or to aid in their sale, and upon their sale in any form except by public authority; and all these prohibitions are enforced by the most severe penalties. Whoever sells liquors in any building, and the same are there drank (*sic*), is guilty of keeping a drinking-house and is to be fined $100 and costs, *and* imprisoned sixty days; and this, apparently, for a single sale. Liquors kept for unlawful sale are contraband and are to be seized and destroyed. Magistrates are to issue search-warrants to search not only places but persons, for liquor. All places where liquor is sold and "all places of *resort* where intoxicating liquors are kept, sold, given away, drank [*sic*], or dispensed in any manner not provided for by law, are common nuisances." The statute does not say "*public* resort," and was undoubtedly intended to hit the case of private clubs, but I cannot learn that an attempt has ever been made to apply it to them. The statute is quite long and is full of the most drastic provisions for its more perfect enforcement. Where it is enforced, not only can no liquor be sold for drinking purposes, but no druggist can even keep alcohol for sale for any purpose whatever.

But as the Legislature realized that intoxicating liquors might be needed for "medicinal mechanical, and manufacturing purposes," a State Commissioner is appointed to purchase such liquors and sell them to the various towns. Each town may (not must) buy liquors of such commissioner and appoint an agent to sell them, but only to residents of the town and only for the purposes above mentioned. And this is the only way to get liquor open to the general public.

It will be noted, however, that the prohibitions of the statute are all upon the sale, and not upon the use, of intoxicants. An attempt to prohibit the drinking of liquor by its lawful owner would be too great an infringement of personal liberty even for a Maine Legislature, and would probably be held unconstitutional by the courts. And so any man except

t e very poor can order his liquor from Boston, have it sent him by express, and use it in his own family as he chooses.

Mr. Woodbury, a prominent banker of Portland, stated, in a paper published in 1881, that after inquiry at express offices and similar places, he should estimate the amount spent by Portland for liquor in a year at $378,000. It must be more than that now. Portland has grown considerably in the last ten years, and has now a population of about 40,000.

In the country towns, or some of them, where public sentiment supports it, the law seems to have accomplished its object fairly well. In such towns a generation has grown up without any acquaintance with a public bar or a saloon; and this, in the case of a young man carefully brought up, is a good deal. But in the cities the law has notoriously been either evaded or openly disregarded, and public sentiment has been openly in favor of a very lax enforcement of the law. The hotels all had bars for the sale of liquor, although these were sometimes in the third story instead of the first, and in a room with a number on the door instead of without one. This was the case in Portland until two years ago, when Cumberland County, in which Portland is, elected a sheriff who has been making an honest and courageous attempt to enforce the law, and has absolutely suppressed the open sale of liquor. No reputable hotel-keeper or druggist now dares to keep it on sale, with the penalty of imprisonment staring him in the face.

But has this action of the sheriff stopped the illegal sale of liquor and diminished drunkenness? All sorts and conditions of men (except the veteran Neal Dow, the author of the law) to whom I spoke on the subject, agree that it has not. The police reports show plenty of arrests for drunkenness, but these arrests are no sort of indication of the amount of public drunkenness that exists. One of the policemen whose beat is in the lower part of the city, told me that he did not arrest one per cent. of the "cross-legged drunks" that he met; in fact, that he arrested no one for drunkenness unless the offender were *very* disorderly as well. The city officials would have no time for anything else if they were to arrest all the drunken men. On the occasion of the one visit I made to Portland's fine park, at ten o'clock one morning, I saw under a tree by the side of the little lake around which nurses and children were paddling in boats, a man lying dead-drunk. The park-keeper told me this was a very common sight, and that every morning he picked up a lot of empty bottles.

The action of the sheriff has entirely changed the character of the liquor traffic. It is now largely conducted by men called pocket-peddlers—men who stand on the street corners with a bottle in one pocket and a glass in the other, and will sell you a drink in a doorway or a horse-shed. It has also changed the character of the liquor sold. Good liquor is not to be had by the average man. One of the principal of the illicit beverages is a deadly compound called "split," composed of alcohol and water.

My own experience may be of interest. Securing a young man who knew the town as a guide, I started out in the business part of the town at noon one day to see what could be got. We visited three stores or shops where legitimate business of some kind was being carried on. In the first we could get nothing to drink because the proprietor was at his dinner and the assistant could not leave his post. In the second we bought and drank a bottle of lager (vile stuff it was). In the third we asked if we could get a couple of cases of lager next day if we wanted it, and were told we could. (Lager is expressly declared by the statute to be an intoxicating liquor.) Then we walked through two or three streets near the wharves and spoke to two or three knots of men on street corners or in doorways, and soon found a man who sold us, for thirty-five cents, a half-pint flask of (so-called) whiskey out of his pocket. I did not venture to taste this, as my guide assured me that it was liquid poison. All this was in the space of about half an hour. We looked for a pocket-peddler, but did not find one, it being the wrong time of the day. My guide told me that in the afternoon or evening we could find them readily.

Heretofore the question of prohibition has not generally been a political question, in the sense that the two great parties have taken opposite sides upon it; but the liquor-sellers and their hangers-on, needing that the officers of the law should wink at their breach of it, have generally attached themselves to the party in power in their locality, and so the Republican party, being in power in most towns in Maine, has generally controlled the liquor vote. But the present Republican sheriff of Cumberland County, refusing to wink at violations of the law, has driven the liquor vote solidly over to the Democratic party. And not only the liquor vote but an immense number of other citizens who, like Sergeant Stebbins, are "in favor of the law but agin' its enforcement" (and it is astonishing how many of these there are), will vote the same way. The sentiment is very generally expressed that the sheriff, the sworn officer of the law, has done very wrong in enforcing the law so strictly. The two principal papers of the town, the *Press* and the *Argus*, are carrying on quite a heated controversy on the subject. The *Press* (Republican) says that the sheriff is to be commended for so faithfully performing his sworn duty. The *Argus* (Democratic) says (July 5): "In driving out of the city the sale of beer and ale, Sheriff Cram brought in the sale of 'split' by bottle-peddlers, and made hundreds of our young men form that worst of all habits—the habit of providing themselves with a private bottle of whiskey." Both papers undoubtedly speak the truth.

The city election last March threw the entire city government into the hands of the Democratic party, and it seems to be generally conceded that the county election next September will go the same way—all on account of Sheriff Cram's enforcement of the law. How the law fares at the hands of those who are not in sympathy with it may be seen by a visit to the City Liquor Agency, established under the provisions of the law of which I have spoken. I stepped into the place one afternoon, and found two men behind a counter filling bottles as fast as possible. Large printed signs informed me that liquor was to be sold only to residents of Portland, and only for medicinal, mechanical, or manufacturing purposes; and that any false representation was punishable by a penalty of $20. Men *and women* were pressing up to the counter faster than they could be served, so that they had to stand *en queue*. As some man, looking remarkably like the ordinary bar-room loafer of other States, would approach the counter, the following dialogue would be had:

Agent—What do you want?
Customer—Pint o' whiskey.
Agent—Bourbon or rye?
Customer—Bourbon.
Agent—Medicine?
Customer—Yes.
Agent—What's your name?

Customer gives a name and address, which are believed to be fictitious in the majority of instances.

Agent—Fifty cents.

While this conversation was going on, the agent would be filling the bottle, to save time, and at the end he would jot down, with pencil, the name and address on a sheet of paper lying on the counter. I stayed there several minutes, and saw a number of customers served; and the only attempt to provide that the law should be complied with as to the purpose for which the liquor was sold, was the stereotyped question and answer, "Medicine?" "Yes." Last year the Portland agency reported sales to the amount of $57,333.30. This is probably much below the truth, as the agency is said to be a very profitable position; but assuming it to be correct, it probably represents at least one hundred thousand lies.

A prominent Republican lawyer, who has held high positions in State and city government, told me that prohibition not only did not prohibit, but was attended with three great evils: it made legislators hypocrites; it corrupted public officers; and it filled the courts with perjury. It has happened, so I was told, that Governor and legislators would get high on whiskey illegally sold on the evening of the very day when they had passed a stringent amendment to the law. Policemen and deputy sheriffs who would be proof against any bribe offered them in the matter of an ordinary crime, see no harm in taking money to wink at what they cannot see to be a crime at all; but, once in the habit of bribe-taking, they soon cease to draw distinctions between crimes. Just so it seems to many men a venial offence to swear to a lie for the purpose of aiding a friend who is likely to go to jail for doing what it would seem all men have a natural right to do; but when one has once begun the practice of perjury, distinctions between crimes are lost sight of.

My experience of Portland makes me believe that here, at least, prohibition increases rather than diminishes drunkenness, and that the lying, bribery, and perjury that necessarily accompany it are demoralizing the people. The little good that the law accomplishes in the way of preventing open sales of liquor is far outweighed by the great evils that accompany it.

R.

THE QUESTION OF ALSACE AND THE RUSSIAN ALLIANCE.

PARIS, July 11, 1892.

IN a preceding letter I endeavored to point out the various phases of the present political situation, the different causes that had worked together to bring it about, and the divers currents of opinion arising from it. This study was nevertheless incomplete, inasmuch as I treated only of home politics. In the case, however, of a country like France, surrounded, as she is, by neighbors whose military force makes them her rivals, the question of foreign policy is all-important. I profit, therefore, by the momentary lull in party warfare, and proceed to sketch the main lines of public opinion in relation to foreign affairs. Speaking baldly, and emission made of secondary issues, the mind of the country may be said to reflect friendship and understanding with Russia, and hostility towards Germany and her allies.

There is no need to dwell upon the consequences of the war of 1870, so far as the gene-

ral situation in Europe is concerned. It is only too evident that the Treaty of Frankfort opened a gulf between France and Germany. France could not reconcile herself to her defeat, nor yet make up her mind to the loss of her provinces. She therefore set about reconstructing her shattered power and her army, with the apparent intention of seizing the favorable moment to retake the territory she had lost. Germany, on her side, in order to maintain her superiority, continued *pari passu* to increase her existing armaments. And so for the last twenty years these two Powers have remained facing each other, like combatants watching each other's movements; officially professing peaceful intentions, and yet all the time amassing arms and men destined for war. Once, and once only, during this period, a kind of approximation and half-reconciliation has been brought about between them. In 1884 and 1885, at a time when the various European Powers were first specially interesting themselves in Africa as a field for colonization, a common interest and the desire to resist the exorbitant claims of England drew the Cabinets of Paris and Berlin nearer together. But this was only an interlude. Indeed, even if the French Government had seriously desired it, a lasting understanding with Germany would have been out of the question. Ever since the war, the vast majority, one might almost say the entire nation, of the French reckon among the first principles of their patriotism the hatred of Germany, the continuous protest against the Treaty of Frankfort, and the duty of liberating Alsace and Lorraine from the yoke which weighs upon them.

In order to assure her supremacy in Europe, Germany had need of allies. She therefore made overtures to Austria and Italy, and the result was the Triple Alliance. This diplomatic success was not obtained without creating corresponding difficulties. Forced, almost, to favor Austria's claims at the Congress of Berlin when this Power sought to improve its eastern frontier, Germany was the cause of Russia's losing a part of the advantage she deemed assured to her by her victories over Turkey in 1877-8; and, in consequence, the relations between Berlin and St. Petersburg became much less cordial. Lacking sympathy with the policy of the Triple Alliance, the Empire of the Czars grew naturally more friendly disposed towards the Power against whom the Triple Alliance was mainly directed. The progress of this friendship was marked by a series of minor diplomatic incidents, culminating in the visit of a French squadron to Cronstadt, and a display of cordiality between the two nationalities that was patent to all the world. Henceforth, the Franco-Russian agreement was an official fact. Though it would be impossible to state whether, in the real sense of the word, an alliance had been concluded, from the point of view of public opinion in France the distinction is of comparatively little importance. The Russian Alliance, as it is usually called here, produced a prodigious effect. For the country to feel that it was no longer alone, that, whatever might happen, it would have the support of an ally whose power was all the more dreaded as it was to a certain extent unknown—this, joined to the inborn love we French have of demonstrating, carried the national enthusiasm to a pitch not easy to describe. The travelling peddlers hawked about, even in the very heart of the country, symbolic chromolithographs in which the Czar and M. Carnot were represented exchanging a hearty grasp of the hand; not a choir but learned the Russian national hymn, which the public always stood up to hear after the Marseillaise; and, by a singular irony of circumstances, certain ultra-radical newspapers, carrying as superscription and motto, "No God and no master," published, in the form of supplement, the text of this national hymn, which commences with the words: "God protect the Czar."

It must be admitted that there are people who do not share the general enthusiasm, and who warn their neighbors that the Russian Army would not, and could not, for technical reasons, take the field as our ally so readily as is imagined. They add that, so far as appearances go, it is not to the Czar's interest to favor France's revenge, since he knows it is only her hope of his help that attaches her to his policy. Those, however, who give utterance to these divergent opinions are mostly politicians by profession or high State functionaries; and their criticisms, expressed in society drawing rooms, find no echo among the outside public. If we look at the small provincial newspapers, which reflect not unfaithfully the average middle-class opinion, we meet with an absolute confidence that the Czar is going to aid us against Germany, and that the Franco-Russian combination will suffice to crush our rival.

From the foregoing it might seem reasonable to suppose that the war feeling in France has been lately increasing in intensity. The hatred of Germany exists. The wish to recover the lost provinces exists also. Resignation to the *status quo* is still repudiated by the nation; and since it is believed that, both from a military and a diplomatic point of view, we are in the best possible situation for making war, why, may it be asked, should not the nation desire it? This reasoning is not altogether hypothetic. A certain number really argue thus; but compared with the whole population they are very few. Taken throughout, the country is thoroughly inclined towards peace. There are several causes of this apparent contradiction.

First of all we may notice the great restraining influence at present exercised by the fact of military service being obligatory upon all. When war directly affected only one part of the population, the other part, undisturbed in its daily avocations, might permit itself to indulge in more bellicose ideas—might, by the fact of its own immunity from the life-and-death risk, urge on a war for some trivial reason. Even those who then figured as combatants fought with the greater willingness, since military service was to them a trade. To-day all this is changed, and, except by the officers, the time spent in the army is regarded as a kind of tax which is necessary to be paid, but which one may be allowed to pay grumblingly. When we recollect that an army mobilization in France claims all the citizens who are between twenty and forty-five years of age, and that it leaves no family exempt, it is quite sufficient to explain why those who wish in their hearts for war are in a small minority. In addition to these personal motives are the reflections arising as to the probable nature of any future war. Then for the first time will come into use all the dread instruments of destruction that military science during the last twenty years has added to those already employed. With such arms on either side the slaughter will be increased tenfold. But, further, if only to make the issue definitive, no mercy will be shown to the vanquished, and, however much one may hope for and anticipate victory, one hesitates to engage in so formidable an undertaking, especially as victor no less than vanquished is likely to be ruined by the struggle.

Last of all, and perhaps the most curious phenomenon to observe, the motives for which war might be desired seem themselves in a fair way to lose their original intensity. Let us leave out of count the small number of persons who think, openly or covertly, that France ought not to seek to get possession again of Alsace and Lorraine—manufacturers who fear the competition of Mülhausen or Colmar, Socialists who make light of the sentiment of patriotism, and who do not care whether the frontier is defined by the Vosges or the Rhine; these minorities are so inconsiderable that they may be neglected. Let us, on the other hand, repeat that our fellow-countrymen, almost to a man, declare it indispensable that France should recover the provinces she has lost—this, either from motives of sentiment, as, for example, that Germany, in annexing these provinces against their wish, violated the principles of abstract justice; or, again, from regard to the national safety, Metz in the hands of Germany being regarded as a constant menace. Let us, in fine, grant that, under present conditions, public feeling continues naturally to be very hostile to Germany. In spite of all, it may be asserted that the hatred against Germany, if it really still exists, seems to grow less crude and less unreasoning. A proof of this has been lately furnished.

A certain number of writers and public men, deploring the general situation in Europe and the armed peace which weighs so heavily on all sorts and conditions, and rightly judging the chief cause of this situation to be the difference existing between France and Germany, had published a series of articles in order to show that it was possible to escape from the difficulties that exist at the present time without resorting to all the terrible eventualities of war. One proposed an exchange of Alsace in return for a French colony; another, a money redemption; a third, the neutralization of the disputed territory. These projects, in themselves chimerical, were commented on in the French press in a very significant manner. Certain newspapers affirmed that it was impossible to dream of an amicable arrangement, "the hate of German for French being only equalled by the hate of French for German." But for the most part the press articles ran on these lines—that whenever and however we shall have come into possession again of the provinces that Germany has taken from us, we shall be quite willing to live on good terms with her; and if such an end can be obtained without war, we shall be only too delighted.

In quite a different order of ideas one sees a current of opinion which has existed now for some little time, and which may work in the direction of a better understanding between France and Germany. A German writer, who preferred not to reveal his name (rumor would have it that the author was a high functionary of the German Court, if not the Emperor himself), published a pamphlet, which was immediately translated into French, wherein he undertook to prove that the various European States would soon be ruined economically unless they combined closely in order to cope with the formidable competition of America. The same idea has since been taken up by other writers, and the opinion it embodies is perhaps destined to acquire a certain importance.

Such, then, are the chief phases of public opinion in France in relation to the sub-

ject I set out to treat. To sum up the foregoing in a few words, I may repeat that the hatred between France and Germany seems to grow less acute. Certain tendencies may be observed here and there that are capable of bringing about a reconciliation, though at a date still distant. To tell the truth, Germany seems in no wise disposed to abandon her conquests of 1871, nor France to cease reclaiming what she has lost. Moreover, the national claim in France may be considered to have all the more weight as it is the more calmly made; for, in spite of the enthusiasm called forth by the Russian alliance, no one here seems to desire war. S.

AMONG THE PSYCHOLOGISTS OF PARIS.

PARIS, June, 1892.

OF course, the phrase "Psychologists of Paris" suggests Hypnotism to the reader, and I use it with that intention. Paris has become, in a peculiar sense, the place to study Hypnotism, for the reason that much of the best work has been done here. Yet everybody knows the rivalry between Paris and Nancy, which has embittered many recent publications and turned the course of discovery into the channels of controversy. Everybody knows, too, that the theory of "Suggestion," as advocated by the Nancy men, is now the dominant explanation of the facts of the hypnotic trance.

No doubt it is because of the controversial turn recently taken by the discussion that the Paris professors are losing interest in the development which owed its first impulse to them —no doubt this, rather than the fact that the Nancy theory is more than holding its own against them. As Professor Ribot wrote me before I arrived, "Hypnotism is on the decline in Paris. Many of the serious men who for merly busied themselves with it think that it has been much abused in the last six months, and that it would be better to drop it for a time." This I found confirmed both by Charcot, who seemed content to use the sleep very moderately as a therapeutic agent, and by Binet, who, as will appear further on, is turning his attention to Experimental Psychology.

The Paris school, locally considered, has made a very important acquisition, however, in the person of Prof. Pierre Janet, called from Havre to the chair of Philosophy in the Collège Rollin. He is a nephew of Paul Janet, the philosopher, and is already well known as the author of 'L'Automatisme Psychologique,' a book in which he describes certain remarkable cases of "subconscious personality" developed among his patients at Havre. He now holds a position also in the Salpêtrière; and it is to him that I am indebted for the interesting day that I spent in the wards of this celebrated institution. In the Salpêtrière, Prof. Janet has found abundant means of confirming the facts, now classic, which he established in his earlier hysterical patients, Léonie, etc. He has a patient, whom I may call X, in whom the activities of the subconscious are readily and forcibly developed—a young, hysterical girl of remarkably bright and unaffected nature. The personality of the normal X is insensible to stimulations in certain regions of the skin and retina; the personality of the hypnotized X possesses these missing sense areas. She detects objects outside of her usual field of vision, feels the prick of pins where before insensible, etc. That is, the second personality gets experiences from nervous events which are inaccessible to the first personality. Further, X the somnambulist remembers objects seen by X the somnambulist —objects which X the hysteric declares she has never seen. Again, the second personality, the somnambulist, replies by writing (with a hand hidden behind a screen) words, sentences, answers, of which the first personality is quite unconscious. Such facts, which I have no space to dwell upon, can be explained, it seems, only on the "sub-personality" hypothesis—unless we call it all fraud, and impeach the scientific honesty or capacity of many observers.

The Paris school, it will be remembered, distinguish three stages in the hypnotic trance—all abnormal or diseased conditions to which the nervous system is subject. These states are called catalepsy, somnambulism, and lethargy. The best brief exposition of these three "stages of Charcot" in English is Binet and Féré's 'Animal Magnetism,' in the "International Scientific Series." Recent criticism has tended to show that the methods of inducing these stages one after another may really be resolved into "suggestion," and that the stages are only degrees in profundity of the one hypnotic sleep. This much the Nancy school can certainly claim credit for. Janet distinguishes the stages—as every one must continue to do—as a matter of description and symptom, and in part resorts to the artificial system of signs, rubs, etc., formerly declared necessary for transferring the patient from one stage to another. Binet, on the other hand, has changed his mind some what since he wrote with Féré, as he himself told me—a change which may be seen in some passages of his new book, 'Les Altérations de la Personalité.'

Prof. Janet has another patient (Y), also an hysterical woman, in whom the stages are very marked, and whom he seems to regard as more typical than those who show less variety of state. Nothing could be more definite than the lapse of Y into lethargy, or her rise into somnambulism, when the proper button is pressed; and the proper performance in each state appears when called for with the regularity of clock-work. But one cannot rid himself of the suspicion that it is all acquired machinery; that the magic "suggestion" works through sub-consciousness, exalted sense-perception, or the influence which Ochorowicz calls "psychic atmosphere." And this suspicion is strengthened when one has seen the utter lack of systematic performance in this respect shown by the patients at Nancy.

Prof. Janet's hypnotic method is very mild. He is a man of hardly more than thirty-five years, of great reserve force, evidently, but rather persuasive than commanding with his patients. He is also somewhat under the influence of the reaction spoken of above, not engaging this summer in new experimentation, and not caring, as he said, to take any part in the heated discussion on "criminal suggestion." The man, on the other hand, who is making his usual exhibition of hypnotic subjects before medical men is Luys, at the Hôpital de la Charité. He lectures on "Brain Functions, illustrated by Hypnology." This means a half-hour devoted to the exposition of Luys's views on cerebral physiology—pretty well known to everybody—and a half-hour given to the stock performances of stock somnambulists. There is nothing remarkable about either of these two parts, except their pretentious and sensational character—a point on which the best men, both among physiologists and psychologists, express themselves very freely. He did, indeed, give a sample case of criminal suggestion, but it was so lacking in the proper precautions against simulation that could Delbœuf see it (as perhaps he has), he could well take comfort from it.

Besides Charcot's lectures and clinics for mental diseases, an interesting course in the same subject is given this summer by Ball and Ballet at the Hospice St. Anne. Ballet, the lecturer, is one of the clearest and best speakers in Paris. His work is also cautious, solid, and sane, as those will know who have read his little book, 'La Parole Intérieure.' American students of the general subject will find it profitable to hear him and his colleague, especially as the clinique is rich in typical and instructive cases.

The new movement in Experimental Psychology proper has also reached Paris. A laboratory has just been opened in the Sorbonne under the auspices of the Hautes Études. Beaunis, the eminent physiologist, a man capable of the good psychological work shown in his recent book, 'Les Sensations Internes,' and in numerous articles, has been made director, and Binet joint-director. The recent studies of Binet on 'Insect Psychology' are published as the first fruits of this foundation: a subject which he intends to pursue at the International Congress at London in August. Ribot, although Professor in Experimental Psychology in the Collège de France, is not officially connected with the laboratory. In the words of Binet, "the laboratory is not for physiology—there are greater ones already for that—it is for psychology alone." In accordance with this wise determination, very little and very simple apparatus has been so far introduced. The only new thing, in fact, which will interest my readers is the Arsonval chronometer, a simple and apparently reliable substitute for the Hipp chronoscope. It is an adaptation of Hipp's principle without its complexity and clumsiness, and is made by Verdin in Paris, complete, with two reaction-keys and connections, for 350 francs—a very high price. This is the only laboratory foundation in France, and under its present direction we may expect it to do credit to the great institutions which it represents.

In another letter I shall speak of the Nancy school. J. MARK BALDWIN.

Correspondence.

THE HOMESTEAD RIOTERS AND PUBLIC OPINION.

TO THE EDITOR OF THE NATION:

SIR: It is refreshing to turn from the editorials of most of the dailies on the Homestead trouble to the treatment of the same topic by the *Nation;* but is not the *Nation* just a little inclined to attribute too much to the doctrine of "protection"? It is doubtful whether the Homesteaders have secured any "large measure" of sympathy outside of that expressed by the demagogues and their ill-informed brethren in the labor ranks. But, admitting that they have, what evidence is there that this is "because the country is at last awakening to the infamous abuses which go on under the name of 'protection'"? Is it not rather due to the attitude of the daily press and of the (Democratic?) politicians who obscure the real issue by denouncing "Pinkerton thugs," etc., and manufacture sympathy by making the rioters pose as oppressed workingmen?

Yours, F. W. STAEBNER.

LEBANON, N. H., July 20, 1892.

Notes.

BERNARD QUARITCH, London, will have ready in October an edition of 500 copies of Caxton's 'Golden Legend,' in three volumes, quarto, printed from type of William Morris's designing, with ornamental letters and borders also of his invention, besides two full-page woodcuts from designs by Burne-Jones. Mr. Morris and Mr. Frederick S. Ellis will edit the work, furnishing a glossary and some bibliographical memoranda. Caxton's 'Recuyell of the Histories of Troye' will be brought out in similar style in January, and his 'Historye of Reynard the Foxe' is in contemplation.

A new Goethe publication has been promised for the coming month. Almost three hundred letters of F. Riemer to members of the family Frommann in Jena have been collected by Ferdinand Heitmüller, and will be published with a preface and a commentary by him. The letters tell of the daily events in the poet's family and among his acquaintances in Weimar.

The latest bound volume of the *Century* extends from November, 1891, to April, 1892. Pictorially, the leading features have been the continuation of Mr. Cole's Italian Old Masters, and the *Century* Series of Pictures by American Artists. The story of the California Gold-hunters has received an interesting accession in the shape of letters written by W. T. Sherman during the rule of the Vigilance Committee. The chief serial fiction has been Dr. Weir Mitchell's "Characteristics" and Kipling and Balestier's "Naulahka." A paper sure to be referred to hereafter is Mr. Edward Robinson's discussion of the question whether the Greeks painted their sculptures. The visit of Paderewski to this country is commemorated in the present volume in prose and in verse.

The local flavor of the *Overland Monthly* gives to the nineteenth volume, as to its predecessors, a special interest, which is enhanced by the generally photographic illustrations. A paper on "Mission Bells" is in point, and so is the disinterested account of the much debated Temescal Tin Mine— "An American Tin Mine," as Mr. Knight's caption reads, though he spoils all our fine feelings by counting it "a great gain and assurance of success that English capital has been enlisted here." Most delectable of all the contents we have found five autograph letters from ex-President Andrew Jackson to Congressman William M. Gwin of Mississippi, in all the splendor of their illiterate diction. The first is dated Christmas Day, 1840, and deplores the carrying of Mississippi by the "Abolition and Wigg Tickett" in the late Presidential campaign. In the fourth, Jan. 16, 1843, referring to J. Q. Adams's opposition to the refunding of the fine of 1815 for contempt of court in New Orleans, he says: "This poor, disgraced old man cannot by all his low bred insults arous my feelings."

'Les Clouet,' one of the latest reissues from *L'Art* in the series of "Artistes Célèbres," is a most careful study by M. Bouchot, Librarian of the Bibliothèque Nationale, of the very little that is known of these artists and of their contemporary, Corneille de Lyon. The general result seems to be that nothing can be certainly attributed to the first Clouet and very little to the second or to Corneille de Lyon, though M. Bouchot thinks he has established a strong probability that certain admirable miniatures in a (French) manuscript of the Gallic War in the Bibliothèque Nationale are by Jean Clouet, and that the original crayon studies for them are now in the Musée Condé. These studies are strong and Holbein-like portraits of celebrated Frenchmen who lived between 1515 and 1540, and, if they are really by the elder Clouet, show him to be a greater artist than his son, and much greater than he has hitherto been esteemed.

A careful study of abbreviations in Latin palæography by Zanino Volta has recently appeared in Italy ('Delle Abbreviature nella Paleografia Latina'). It contains a fairly exact reproduction of more than 2,500 of these abbreviations.

That versatile savant, Prof. Gustavo Uzielli, has for twenty years made a study of Paolo Dal-Pozzo Toscanelli, the great Florentine astronomer and geographer of the fifteenth century, whose letters to the King of Portugal in 1474 were the principal cause of Columbus's Western adventure, and who had previously urged the Portuguese to complete the circumnavigation of Africa. In a communication to the Florence *Nazione* of June 30, Prof. Uzielli enlarges upon the virtue of that city in Toscanelli's time as the centre of the great geographical movement of the age, and suggests that America might well have owed its name to Toscanelli rather than to any navigator. He is on the eve of publishing certain codices which will throw much light upon the history of geography in the fifteenth century, and will prove that Vespucius had no hand in fastening his name on the New World. Prof. Uzielli is a member of the Royal Commission for the current Columbus centenary festival at Genoa.

In view of the approaching anniversary of the discovery of America, the French Government has arranged in the National Library of Paris an exceedingly attractive and instructive exhibition of maps and globes illustrating the geographical notions which prevailed before and after the time of Columbus. They are for the most part rare originals which either belong to the library and to different departments of the Government or have been borrowed from private collections. We shall probably have occasion to speak of this collection somewhat in detail, and will now only mention a map drawn by Champlain in 1608, with more than a hundred maps giving the results of the expeditions of Joliet, La Salle, and other explorers in the region of the great lakes as far as Hudson's Bay and along the Mississippi and Ohio. There are also plans of North and South American towns, Puerto Rico, Quebec, Montreal, Rio de Janeiro, Saint Louis, Marietta, Pittsburg, and other places from the beginning to the close of the eighteenth century, and one of New York when it consisted only of a fort and a few mills on the south point of Manhattan Island.

That the proprietorship of a newspaper should pass uninterruptedly from father to son for a century and a half is a rare and noteworthy event in the annals of journalism. Such, however, is the case with the *Schlesische Zeitung*, which was founded by Johann Jakob Korn at Breslau in 1742, when this province had just been wrested from Austria and annexed to Prussia by Frederick the Great, and is still published by his lineal descendants. To celebrate this uncommon anniversary a volume has been printed entitled '150 Jahre *Schlesische Zeitung* 1742-1892: Ein Beitrag zur vaterländischen Kultur-Geschichte' (Breslau: Korn). It contains facsmiles of the first number, dated January 3, 1742, and of the proclamations issued by Frederic William III. in March, 1813. This work gives a succinct and remarkably readable survey of European history and of the progress of civilization during the period in question, especially as reflected in the columns of the venerable newspaper.

The first number of Prof. Karl Krumbacher's *Byzantinische Zeitschrift*, of which we noticed the prospectus in a recent issue, has now appeared. It is a well-printed quarterly of 184 pages, and contains twelve articles, one in English, one in French, and the rest in German, besides several literary criticisms and numerous notes. In a preface of a dozen pages the editor states the nature and purpose of the review as the organ of "Byzantinistics" in the broadest sense of the term, defines the limits and scope of this new discipline, and defends its claims to consideration for its own sake, independently of its scholastic relations to classical antiquity, for which it has been hitherto chiefly prized. The periodical is intended to embrace the entire intellectual life of the Greeks during the existence of the Byzantine Empire, extending over more than a thousand years, and Prof. Krumbacher's assurance that it shall be conducted in a strictly scientific manner is certainly fulfilled so far as the present number is concerned. The paper of most general interest is perhaps that on "Byzantine Art," by Prof. Strzyowski. The importance attached to the undertaking is evinced by the fact that the Royal Bavarian Academy of Sciences has made an appropriation for its support.

Vol. II. of the *Journal of American Ethnology and Archæology* (Boston: Houghton, Mifflin & Co.) is occupied chiefly by a very circumstantial account of "A Few Summer Ceremonials at the Tusayan Pueblos," adjacent to the similar habitations of the Zuñis, by the editor, J. Walter Fewkes. Dr. Fewkes also contributes a short report on the present condition of the famous Arizona ruin called Casa Grande. Both these papers are freely illustrated with process cuts, which, however, leave much to be desired in point of clearness. A third paper possessing no little interest is by J. G. Owens, on "Natal Ceremonies of the Hopi Indians."

In the *Critic* for July 9, Dr. Rolfe, the Shaksperian editor, commenting on the fact mentioned in a recent London newspaper that "young bar-tailed godwits are, in autumn, called scamels on the north coast of Norfolk," says: "If they have gone by that name ever since the days of Shakspere, it is curious that the fact did not get into print sooner." Had he taken the trouble to look at the 'Century Dictionary,' he would have found this same definition given, together with a quotation to the same effect from Swainson's 'British Birds,' published in 1885.

The *Scottish Geographical Magazine* for July contains the conclusion of Dr. H. Schlichter's account of the African pygmies. In summing up the result of his investigations, he unhesitatingly rejects the theory that these creatures are simply the degenerate specimens of the tribes among whom they live, because of the great anthropological and ethnological differences between them and their full-sized neighbors. On the other hand, he is favorably inclined to the hypothesis that they are the remnants of the African aborigines. The recent pamphlet on the dwarfs of Mount Atlas is mentioned, but judgment on it is deferred, pending the publication of new evidence promised by Mr. Haliburton. Prof. James Geikie tells of recent researches in the Pleistocene climate and geography of Britain and Northern Europe, the paper being accompanied by a map. Of more general interest is a summary of M. Henri Dauvergne's explorations in the Pamir, during which he claims to have disco-

vered the true sources of the Oxus or Amu Darya in the enormous glaciers of the Hindu Kush. This is followed by a survey of what has been accomplished in British New Guinea within the past three years in exploration, from which it appears that there have been no additional discoveries of gold in paying quantities, though the fact that the general geological features of this part of Papua are "in a very considerable degree identical with those of Australia," would lead to the not unreasonable assumption that "mineral areas of great value may yet await discovery."

The petty lake region *par excellence* of Germany is partly delineated in sheets Nos. 9 and 11 of Vogel's Map of the German Empire (Gotha: Perthes; New York: Westermann), designated Stettin and Allenstein (Pomerania and East Prussia).

Mr. William H. Goodyear, Curator of Fine Arts in the Brooklyn Institute, has been invited to read a paper on his discoveries concerning the Egyptian lotus in classic ornament before the Ninth Oriental Congress in London, Sept. 5-12.

Prof. Edward S. Morse's essay "On the Older Forms of Terra-cotta Roofing-tiles," originally communicated to the Essex Institute, Salem, Mass., and afterwards printed serially in the *American Architect*, has been reprinted in the Bulletin of the Essex Institute and also separately. It is a study of great interest and practical and artistic value, and among the many illustrations are some drawn from the author's favorite Japan.

We have received the first number (for July) of the *American Monthly Magazine*, edited by Mrs. Ellen Hardin Walworth in the interest of the Daughters of the American Revolution, and published by the National Society of that name in Washington. It consists almost wholly of the Proceedings of the First Continental Congress of the Society, Feb. 22-24, 1893. Mrs. Benjamin Harrison presided, and her portrait is prefixed to the present issue of the magazine.

The July number of the *University Bulletin* issued by Columbia College contains the announcement that the final step (for the present at least) has been taken in the readjustment of the government of that institution to suit the changed conditions of its present development. Thirty years ago Columbia College was, like most other American colleges, of the four-year-course type; indeed, it consisted solely of its undergraduate department and of a very young Law School, although it had also a shadowy connection with the College of Physicians and Surgeons. To-day the Medical School has been made an integral part of the University, and a School of Political Science exists by the side of the School of Law; while the School of Mines has grown to maturity and is in reality a School of Applied Science and a School of Architecture also. The July *Bulletin* announces the establishment of a School of Pure Science, and also a strengthening of the School of Philosophy, which has charge of the courses in philosophy, philology, and letters. Beside these university schools stands the old college, now called the School of Arts. The difficult problem of governing a university under laws made for a college has been solved in this way: The trustees established a University Council to consist of the President, of the Dean of every school, and of another delegate from every faculty, and of two other professors appointed by the President. At first this council was merely advisory, but it now becomes the chief legislative body of the University, and thus the management of Columbia is actually in the hands of a representative committee of its professors. Each school is managed by its own faculty in accordance with the decisions of the University Council. The instruction given in the School of Arts ceases with the junior year; and the senior is free to select his studies in any or all of the six University Schools.

The 'Exercises in Connection with the Presentation of the Ladd Observatory to Brown University' last October have been appropriately preserved in a little pamphlet bearing the above title. The Chancellor of the University, Col. William Goddard, presided on that occasion with much grace and dignity, stating in apt phrase the uses of modern astronomy and the intimate relation between that science and the common life of man. Following the Chancellor, Gov. H. W. Ladd, the donor of the Observatory, elucidated the conditions which had led him to make this munificent gift to the University, and President Andrews, in his able and pointed address of acceptance, insisted upon the material values of the higher training in science, showing how civilization in its practical efficiency is in the last analysis totally dependent upon the work done at the centres of learning. Prof. Upton, Director of the new Observatory, next gave account of the astronomical establishments of the earliest time, comparing and contrasting them with the finished structures of to-day, with their elaborate instrumental equipment for work of the last degree of precision; while the exercises were concluded with remarks by Prof. Pickering of Harvard on the gratifying outlook for the future of American astronomy; by Dr. Hastings of Yale, who told the interesting tale of the construction of the great object-glass with which the new telescope was supplied; by Mr. Brashear of Allegheny, who had done the optical work upon this fine lens; and by Prof. Rogers of Colby University, who made a forceful appeal for astronomy from the merely utilitarian view, and demonstrated that "the cultivation of the science of astronomy cheapens the production of cotton-cloth, of woollen goods, of calico, of machinery, indeed of every staple product."

—Though the thirteenth volume of Mr. W. C. Ford's edition of the 'Writings of Washington' (Putnams) comes down to the middle of the year 1798, another volume yet must crown the work; and in the fourteenth, as we learn from a note on p. 445, apropos of Washington's referring to correspondence with Sir Isaac Heard, the editor will take occasion to present all that is known about the Washington pedigree. The political strain of the current volume is agreeably diversified by extracts from Washington's letters to the manager of his estates, showing the most minute oversight of the latter's reports, even to the scrutiny of individual delinquencies on the part of his slaves. Of nearly all of his "hands" he distrusted the common honesty, and he considered himself systematically robbed by them of such property as they could dispose of to white receivers in Alexandria. Their shamming illness, their slowness and inefficiency in working, are also dwelt upon. On the other hand, he complains of rascally and brutal overseers who treat slaves like cattle. The loss of a cook puts him in a painful dilemma, as he has resolved never to purchase another human being, and yet cannot hire white or black to direct his kitchen. To hold slaves or to go unserved was a general sad necessity in Southern society. The disgrace of Randolph appears in the correspondence of this period, and the public feeling over Jay's treaty; and Washington's pungent notes on Monroe's 'View' are extended beyond the point at which Sparks, for some reason, stopped. They furnish some of the best reading in the volume. The growth of the "Federal City," and the speculative boom in it, are also glanced at, and there is much evidence of Washington's desire to see a national university established at the capital. His Farewell Address is printed from the original draft in the Lenox Library, on the same page with Hamilton's draft, which was followed in the main. We observe on p. 230 a reference to vol. i., p. 168, of Mr. Paul Leicester Ford's edition of 'Jefferson's Writings'—proof that this forthcoming publication is all ready to succeed the Washington on its completion.

—It appears that Marshal MacMahon has been occupying himself since his retirement from the Presidency of the French Republic in writing out the souvenirs of his long and active life. The Marshal is now eighty-four years old, and he bears his years lightly. The *Figaro* of July 2 publishes an interview with him from which we learn that his Memoirs are already quite finished. Four copies of them, in fact, have been lithographed, but no one has as yet been permitted to read them. The title will be simply 'Souvenirs du Maréchal de MacMahon, Duc de Magenta.' The interviewer says that the work consists of five goodly volumes—whether of manuscript or print he does not make clear. At any rate, the book promises to be of a certain bulk. It begins with MacMahon's experiences in the African expedition in 1837, when as a captain he did brilliant work at the siege of Constantine. By 1855, when the Crimean war began, he was a general, and he tells the story of his share in that campaign; then follows an account of the Kabyle expedition; then of the war with Italy, where he won his title; then of his return to Africa and his polemic with Cardinal Lavigerie. This ends the first portion of the book. The second part treats of events since 1870—of the war with Prussia, the Débâcle, the work done by the Versailles troops, his own Presidency, and the rest. It is understood that he criticises with considerable severity that part of the conduct of the Franco-Prussian war for which he was not himself responsible; that he goes very fully into the Versailles episode, and that he opens much of the secret history of his own election, and especially of his dealings with the Right. The Marshal says that his book will appear at furthest before two years are over. It is likely enough to be in our hands much before that date—and an interesting book it will be.

—Everybody knows the three thanksgivings in the Jewish liturgy in which the pious Hebrew blesses the Eternal that he was not born an idolater, nor a slave, nor a woman. About a year ago Prof. James Darmesteter published a pamphlet in which he pointed out the fact that these thanksgivings resemble almost to the extent of identity certain invocations in the Parsee liturgy. The identical expressions, he held, were no doubt borrowed on one side or the other; but which was the original possessor of them? M. Darmesteter traced the Jewish thanksgivings back to the second century and to Palestine, where they were attributed to a pupil of the great Rabbi Akiba. The Persian thanksgivings he holds to be of a date somewhere between the fourth and seventh centuries, when there was considerable intercourse between the Persian court and learned Jews. The reciprocal influence of Judaism and Zoroastrianism is one of the more tempting of

the fields of research that lie open to the modern scholar. An item towards the discussion was offered in the *Academy* of June 25 in a letter upon M. Darmesteter's liturgiological pamphlet by Mr. J. Murray Mitchell. He finds in both the Parsee and the Hebrew thanksgivings echoes of earlier Greek philosophers. Diogenes Laertius, in his life of Thales, says: He used to say that he was thankful to fortune for three things—first, because he had been born a man and not a beast; next, that he was a man and not a woman; thirdly, that he was a Greek and not a barbarian. Other slightly different forms of the same thought occur elsewhere, and are attributed variously to Thales, or Socrates, or Plato. Not to go minutely into the extremely important question of dates, it may be said roughly that the saying in question may well have been familiar among the Greeks as early as the third century before Christ, and was certainly familiar to them by the middle of the first century of the Christian era. So they antedate both the Jewish and the Parsee liturgies. The Jews doubtless—or most likely—borrowed from the Greeks; but from whom did the Persians borrow? Possibly from the Jews; M. Darmesteter would no doubt hold this view. But the Greeks, and especially their philosophers, had an influence upon Persia far greater than is commonly supposed, and greater than we commonly realize to ourselves. It would no doubt be extravagant to compare it with the influence of French thought upon Russia, but it is analogous to that.

—The latest contribution to the literature of witchcraft and of demoniacal possession comes to us from Munich, Bavaria, in the form of a pamphlet of thirteen pages entitled 'Die Teufelsaustreibung in Wemding. Nach dem Berichte des P. Aurelian für das Volk kritisch beleuchtet von Richard Treufels.' The official report of the exorcist, Father Aurelian, who cast the devil out of a boy ten years of age in the church of the Capuchin cloister at Wemding, July 13 and 14, 1891, is printed in full and reads like a chapter from the 'Malleus Maleficarum,' or some mediæval dissertation on demonology. In his introduction, Herr Treufels asserts that no true Christian, whether Catholic or Protestant, and no devout Jew can question for a moment the reality of demoniacal possession. It is a belief which is based upon the universal assent of mankind, as embodied in the traditions of all nations of ancient and modern times, and confirmed by the unequivocal testimony of the Old and New Testaments and by the teaching and practice of the Catholic Church. He also gives the "signs of possession" and the methods of healing it (exorcisms, sacraments, holy water, etc.) as prescribed by ecclesiastical rituals. On this point Father Aurelian expresses himself still more strongly: "Whoever presumes to deny possession confesses thereby that he has gone astray from the doctrine of the Catholic Church; but he will believe in possession when he himself is in the possession of the devil in hell. As for me, I have the authority of two bishops," namely, the Rt. Rev. Pancratius of Augsburg and Leopold of Eichstadt. An interesting volume bearing in part upon the same subject is Adolf Harnack's 'Medicinisches aus der ältesten Kirchengeschichte' (Leipzig: Hinrich). The work is divided into six chapters, which treat of the earliest Christian physicians, the views held by Christians of the first three centuries concerning dietetics, therapeutics, physiology, psychology, diseases, exorcisms, and, in general, of the Gospel of the Saviour as a gospel of healing. Christ conceived of himself as a physician sent to them that are sick, and both he and his disciples, in proclaiming their mission to mankind, are fond of using imagery drawn from the healing art. The same tendency is observable in the writings of the fathers. The book begins with an account of "Luke, the beloved physician," who, besides being the author of the third Gospel, has also ascribed to him by tradition the Acts of the Apostles and portions of the Epistle to the Hebrews—this last upon the strength of certain anatomical, dietetic, and therapeutic allusions (Heb. iv. 12; v. 12-14; xii. 12), which do not, however, imply any special knowledge, and might have been written by any person of ordinary intelligence.

RAMSAY'S LANCASTER AND YORK.

Lancaster and York: A Century of English History (A.D. 1399-1485). By Sir James H. Ramsay of Bamff, Bart., M.A., barrister-at-law; late student of Christ Church. With maps and illustrations. Oxford: Clarendon Press; New York: Macmillan. 1892.

THERE have hitherto been some strange gaps in English historiography. We have had no good special history of the period of Lancaster and York, of that of the early Tudors, or of that of Anne. Sir James Ramsay has undertaken to give us a history of the period of Lancaster and York, and he seems to have done his work well. The materials are not copious or of the best kind. In parts there is little more to be made out of them by fair means than a dry skeleton, but we are thankful to a writer who does not try to embellish his story by squeezing out of the materials more than they really have in them. Surfeited with the imaginary and sensational, we rejoice in a change to the sober and conscientious. We can even dispense with what is called philosophy, so long as we are assured that the facts are given correctly and in their true connection. A historian whose facts are untrustworthy was the other day defended by an admirer as giving what was better than fact, "the spirit of history." We have had too much of the spirit of history in this sense. Sir James Ramsay is singularly abstemious in the use of the paint-box. Once we thought we had caught him in resorting to it. It was where, on the eve of Agincourt, he speaks of Henry as "gaining a view of the *dark* squadrons of the French slowly wending their way upwards along a hollow." But on reference to the authority (the 'Gesta') we find *tetros cuneos Gallicorum*; and though *tetros* for "dark" would be a mediæval barbarism, the interpretation is probably right.

The York and Lancaster period falls into two parts, the first part comprising the last portion of the hundred-years' war between England and France, the second the wars of the Roses. The wars of the Roses, with all their havoc—material, moral, social, and political—were the natural sequel of the hundred-years' war. The restless, turbulent, bloodthirsty, and rapacious temper formed in raiding over France showed itself, when there was no longer an outlet for it abroad, in civil broil at home; and from "spanning for French crowns" the nobles took to "spanning" for each other's estates and heads. Here was another verification of the Greek poet's saying, that Ate has a numerous progeny of children like their parent. We may extend the observation still further if we remember that the idea of a dominion embracing at once English and French territory was a legacy of the Norman conquest. The feelings of the English and French nations towards each other have hardly to this hour got clear of the hatred contracted during a century of murderous struggle brought on by chimerical ambition. If Joan of Arc is canonized, as has been proposed, the canonization will be a fresh outletting of the waters of bitterness from the historical Marah. The imperfect unification of the British Islands which is at this moment showing itself, not only in the Irish demand for home rule, but in the recrudescence of Scotch and Welsh separatism, is the fruit of the diversion to fields beyond the sea of the energies which ought to have been steadily devoted to the consolidation of the island realm. The only redeeming features of the senseless and barren struggle were an advance of courtesy and humanity in war among the nobles of the two countries, the benefit of which, however, did not extend to the common people; and the successes of the English archers, which, as the archers were a plebeian infantry, helped with the invention of cannon to subvert military aristocracy.

It is due to Edward III., with whom this train of woes began, to say that in his case the French King had been unquestionably the aggressor, and that Edward's assumption of the title of "King of France" was not so much an act of extravagant ambition as a measure of war. But no such excuse can be made for Henry V. His intervention in France was invited by the Burgundian faction, it is true; but this, while it tempted, did not justify or palliate his ambition. He seems to have had an intense belief in his right to the French crown, and to have been confirmed in that belief and stimulated to act upon it by the ecclesiastics. He said on his death-bed that as his cause was righteous, the guilt of bloodshed could not lie at his door—"of that, he had been assured by sage and holy men before ever he drew the sword." The commons, as Sir James Ramsay shows, were by no means eager for the war, while prelates spoke heartily in its favor. Shakspere has embalmed the tradition which puts into the mouth of Archbishop Chicheley a speech advocating the invasion of France as a mode of diverting the minds of the King and people from religious change and the secularization of Church property. It has been proved that this speech could not really have been delivered; yet Sir James Ramsay may be right in surmising that the fiction had its origin in a fact. Religious change and the secularization of Church property were in the air. Archbishop Chicheley, when he founded a college at Oxford, dedicated it specially to the performance of masses for the souls of those who had fallen at Agincourt, which seems to show that he felt some personal responsibility for that carnage. If this view of the case is well founded, we have another illustration of the tendency of Church establishments; for Archbishop Chicheley and his colleagues would hardly have instigated an invasion of France merely for the purpose of putting an end to a doctrinal controversy in England, had not the ascendency of the impugned doctrines been essential to the retention by the clergy of enormous wealth and power.

Freeman used to say that he never could tell whether Henry IV. was the best or the worst of kings. Sir James Ramsay seems to feel no doubt that Henry had Richard II. murdered in prison; not, however, out of cruelty but out of policy, to put an end to the conspiracies in Richard's favor, while conscience, in those days of religious formalism, might be technically salved by starving the victim to death, which, it seems, was done, instead of shedding

his blood. Henry's political alliance with the reactionary clergy, which bore fruit in the statute *De heretico comburendo*, and the burning of Lollards are also to be scored against him, though by way of compensation he gave a startling and stunning blow to clerical privilege by beheading Archbishop Scrope for treason. On the other hand, his reign was constitutional, and the credit seems partly due to his own temper, though the novelty of his dynasty, the doubtfulness of his title from the legitimists' point of view, and the restiveness of the great nobles, who regarded him with jealousy as one of themselves raised above their heads, made the support of the commons indispensable. Sir James Ramsay paints him as painstaking and industrious, merciful, temperate, and domestic, and sets down his character and talents as those of a good official, giving him credit for bequeathing to his son a strongly-founded throne, and for having effected this by parliamentary tact and regard to constitutional principles. The words, "uneasy lies the head that wears a crown," and the speech of which they form a part, could not have been put into more appropriate lips. If a life of incessant trouble, care, danger, and strife could atone for crime, the soul of Henry IV. was absolved for the murder of Richard II.

The scene in Shakspere where Prince Henry steals the crown is proved to be impossible by the circumstances of the King's death. But the Shaksperian version of Henry V.'s youth, banished to fiction by Mr. Endell Tyler, is restored to history by Sir James Ramsay. It seems that all the sons of Henry IV. were wild, and that they even played practical jokes much resembling the escapade at Gadshill. Prince Henry did quarrel with his father, and even sought to force him to abdicate. He also was at enmity with Judge Gascoigne. On his accession his character changed, and he became a great man of action. As a king, though stern and inexorable, he was righteous. His rule in France was admitted by the French to be good; his camp was a model of discipline; and he strictly restrained excesses in war. His ambition, however, was the ruin of his dynasty. His conquests tired the heart of the nation; their inevitable loss filled it with rage and shame; and Sir James Ramsay is warranted in saying that the fall of Henry VI. was the Nemesis of Agincourt.

Sir James Ramsay seems to think that in the wars of the Roses the House of Lancaster represented the more constitutional, that of York the stronger and more arbitrary, form of government. We can hardly see on what this judgment is founded. The government of the first Lancastrian king could not be arbitrary, because the dynasty had not taken root. But it was firmly rooted at the accession of his grandson, as its tenacity through the storms which followed proved. So far as we can see, in the mist of a very imperfectly recorded period, the rule of the camarilla which governed in the name of the imbecile Henry VI., though weak, was not constitutional. It certainly was irresponsible. Margaret of Anjou was not likely to have brought constitutional principles from her home. Her letters, which have been preserved, seem to betray a tendency to favoritism and a habit of interference with public justice. Her conduct in the war was wolfish. Gloucester died a captive in the hands of Margaret and Suffolk and at the moment when they had reason to fear his denunciation of the secret session of Maire. That he died of chagrin is surely a very charitable hypothesis. London and the other cities, which would generally be favorable to popular government, seem to have been on the Yorkist side, though this may have been partly due to the folly of Margaret in bringing down upon southern England a marauding body of Scotch auxiliaries whose fatal aid she had purchased by the cession of Berwick. The monarchy of Edward IV., founded in successful war and on the ruin of the baronage, then almost the sole trustee of political liberty, could not fail to be arbitrary apart from any political traditions of his house. The humiliations, distractions, and weaknesses of the camarilla Government were sufficient to account for its fall and for the confusion which ensued. But the contest soon assumed the character of a murderous blood-feud between two groups of families, in which all principles of action, except mutual hatred or personal ambition and rapacity, seem to have been lost. The greatest politician on the stage was Warwick, in whose tortuous and unscrupulous career we can trace no public aim.

Sir James Ramsay has not overlooked, but he does not seem to have quite sufficiently marked, the critical change made in the situation by the birth of Prince Edward. It does not appear that York's ambition was very daring, unmeasured, or precipitate. He would probably have been satisfied with the Regency, or, supposing the King legally capable of government, with a fair share of power and an assurance of the succession. But the birth of a son to the King and Margaret shut the door of compromise, and compelled York either to claim the crown or to retire into a private station, in which, after what had been done, he would hardly have been safe under Margaret of Anjou. A similar change in a political situation was wrought by the birth of a son to James II., which, by shutting out the prospect of deliverance at the tyrant's death, compelled the national leaders to strike without delay. In both cases the child was declared by the adverse party suppositious. We know that in the case of James's son the suspicion, though not unnatural, was unfounded. But Prince Edward was born after eight years of barren wedlock, when the King was not only imbecile in mind, but so weak in body that he could not rise from his chair without assistance. Margaret fought for the boy's right with a fierce and indomitable energy which might seem to show that he was her own child. But she had hatred and ambition, both most intense, to stimulate her, apart from maternal love.

A similar remark may be made with regard to the murder of the Princes in the Tower by Richard III. Sir James Ramsay, we venture to think, hardly appreciates the effect of this incident. Public horror does not seem to have been excited by Richard's usurpation, if indeed the doctrine of legitimacy was so well established that a King who had been recognized by Parliament and crowned by the Church would be generally deemed a usurper. The people had become inured to violent changes of dynasty, and they had the strongest reasons for preferring the rule of an able adult like Richard to that of a boy under whose name another camarilla would have borne sway. They had also become familiar with all ordinary butchery, and would have taken the execution by Richard of Hastings and other political enemies almost as a matter of course. When Richard was at Oxford on his royal progress, Waynflete, Bishop of Winchester, a prelate of the highest character, came from Winchester expressly to meet and entertain the King at Magdalen College, of which the Bishop was the founder. But the murder of the two young princes by their uncle seems to have touched the hearts of the common people, and called forth against Richard that general execration which made him morally weak while in numbers he was strong, and unnerved the arms of his soldiers on the decisive field. As to the fact of the murder, Sir James Ramsay has no doubt, nor can any doubt be reasonably felt. Whose were the two skeletons, corresponding to the ages of the two boys, which were found under the staircase leading up to the chapel in the White Tower in 1674?

The materials for the financial part of the history are more complete and trustworthy than for the rest. Sir James Ramsay has made good use of them. The bearing of the finance on the general history is never to be left out of sight. It is an important fact that the old feudal and landed revenues of the Crown in the time of Henry IV. probably did not amount to 25,000 pounds, so that the Royal Government could not be carried on without the aid of the commons, which was doled out reluctantly and sparingly—often, indeed, in wholly inadequate measure; the popular notion being that the King ought to live "of his own."

The portraits are very interesting. The features of Henry IV. are solid and heavy, such as that of a "good official," to repeat Sir James Ramsay's term, might be. His face is that of a sort of English Vespasian. We could hardly discern the force of the conqueror in the face of Henry V., but it bespeaks sternness. On the face of Henry VI. disaster is clearly written. His face in boyhood is weak, in manhood plainly imbecile. Edward IV. had a great reputation for beauty, which his portrait hardly bears out, while it does bear out his reputation for sensuality. He was evidently a great soldier. Of the comparative humanity which Sir James Ramsay ascribes to him we do not clearly see the proof. He butchered the leaders of the other party without mercy, and if he spared the commons, it must be remembered that butchering the common people in England was not so safe a practice as in France. In the face of Richard III. there is nothing villanous, though the look is gloomy as well as careworn. He founded religious institutions, he encouraged letters by permitting the free importation of books, and the legislative record of his short reign is good. The age, in England as well as in Italy, was a moral and religious interregnum in which a politician might be unscrupulous even to the extent of committing murder without being naturally a superlative villain.

It is derogatory to the Clarendon Press that these important volumes should have been allowed to be published without an index.

WHYMPER AMONG THE ANDES.

Travels amongst the Great Andes of the Equator. By Edward Whymper. Charles Scribner's Sons. 1892. Pp. xxiv, 456. Maps and illustrations.

Supplementary Appendix to the Same. By Edward Whymper, with Contributions by H. W. Bates, F.R.S., T. G. Bonney, D.Sc., F.R.S., F. D. Godman, F.R.S., and Others. London: John Murray. 1891. Pp. xxii, 147.

IN these days of hasty book-making, the deliberateness of an author who delays twelve years after the collection of his data before giving the results of his labors to the world, cannot but challenge admiration. Mr. Whymper visited Ecuador during the years 1879-'80, and there performed a work which will link

his name as inseparably with the plateaus and mountains of that remarkable country as those of La Condamine and Humboldt before him. This may seem exaggeration to those who know Mr. Whymper only as the author of that light and sketchy narrative, 'Scrambles amongst the Alps'; but in twenty years a great change has come over him. The mere clambering of a dangerous peak for the empty honor of bringing away "the giant's head in a bag," is no longer the incentive to his excursions. An earnest scientific purpose has replaced the boyish enthusiasm of earlier years. He is as indefatigable as ever in climbing mountains, he revels in lofty heights, and courts the perilous *arête* and treacherous glacier; but he now seeks by the most painstaking efforts to establish elevations with absolute accuracy, to determine the effects of high altitudes upon the human system, and to ascertain the characteristics and utmost limits of the flora and fauna of these regions.

He attempted the ascent of eleven of the loftiest Ecuadorian peaks, and attained the summit of nine, among the latter being Chimborazo, Cotopaxi, Antisana, and Cayambe. Chimborazo had previously been considered inaccessible, the failures of Humboldt and Boussingault to accomplish the ascent being well known. It must be remembered, however, that these earlier explorers were inadequately equipped for such a task; neither were they as experienced in this special kind of work. Mr. Whymper, on the other hand, is an adept, and went prepared for every difficulty that might arise. His careful details of his outfit, and his accurate descriptions of his methods of work at high altitudes, will serve as an admirable guide to others who may be tempted to pursue similar investigations in future; and the rich and unexpected field for the student of natural history which Mr. Whymper has discovered will surely stimulate many an expedition into the snowy Andes. Previous travellers have given little attention to the insect life of elevated regions, and the specimens which have been observed have usually been regarded as stragglers from lower levels. Mr. Whymper brought home 160 species collected between the altitudes of 8,000 and 16,660 feet above the sea; of which 60 per cent. were new to science. In addition to these, which were all of considerable size, he rejected a still larger number of small insects on account of the difficulty of inducing specialists to undertake their identification. Coleoptera were the most abundant, existing under stones and in loose detritus, but eight other orders were represented, and butterflies (*Colias alticola*), and several species of moths were taken as high as 16,000 feet. Two species of crustaceans were also found as high as 13,300 feet, and yet, with all this, Mr. Whymper announces that his time was so occupied in following out the other objects of his journey that he could make only the most cursory search for examples of the Andean fauna.

The Appendix is almost wholly devoted to the classification and description of the specimens, of which the Coleoptera are described by H. W. Bates, David Sharp, Henry S. Gorham, A. Sidney Olliff, and Martin Jacoby; the Hymenoptera by Peter Cameron; the Lepidoptera by F. Ducane Godman and Osbert Salvin; the Rhynchota by W. L. Distant; the Crustacea by E. J. Miers, A. E. Eaton, and T. R. R. Stebbing; and the Reptilia and Batrachia by G. A. Boulenger. Prof. T. G. Bonney adds a note on the rocks from the Andes brought home by Mr. Whymper, from which it appears that the geology of this portion of the Andean range is very simple, consisting entirely of andesite, except in the case of the mountain known as Sara-Urcu, which is composed of metamorphic rocks. Still more remarkable is the fact that this widely distributed andesite is highly basic, in many cases being almost quartzless, in which respect the Ecuadorian rocks are markedly different from those to the southward in Peru, where acid rocks, if not predominating, are at least as abundant as basic species.

Mr. Whymper is inclined to be somewhat severe upon former travellers, and in several instances his arraignment of them is not made in a spirit of charity. On the other hand, one can but share his astonishment that so excellent an observer as Humboldt should have asserted the non-existence of glaciers in Ecuador, especially when he had partially ascended Chimborazo, which Whymper saw "crowned by glacier and streaming with glaciers." In fact, there were very few peaks on which Whymper did not find them; and the positions in which they were found are highly instructive, as showing how many conditions besides mere elevation above the sea affect the glacial limit and snow line. Whymper is for discarding the term "snow line" altogether, as being indefinable and meaningless; and with good reason, when the limit of permanent snow on the equator varies from 14,000 feet to 16,700 feet. It is noticeable that the limits of snow and of glacier are uniformly lower on the eastern than on the western peaks of the Ecuadorian Andes; and in the case of Sara-Urcu, the most easterly of all, which Mr. Whymper practically discovered, the glacier descends as low as 14,000 feet. This mountain is almost perpetually concealed by immense cloud banks, formed by condensation from the moisture-laden airs which blow continuously from east to west across the basin of the Amazon. It may be that this condensation is so excessive when these airs first sweep up the Andean slopes into higher altitudes, that the precipitation of snow is more rapid than its melting—thus producing glaciers extending to the singularly low elevation observed on Sara-Urcu; and furthermore, the Amazonian aircurrent, being robbed of so much of its moisture, would need to rise to considerably higher elevations before the vapor tension would be sufficiently reduced to cause further precipitation, which would account for the greater heights of the snow limit on the western peaks.

The elevations determined by Mr. Whymper are unquestionably the most accurate ever made in Ecuador, unless we except those made by the famous Academicians over a somewhat more restricted area. As evidence of the remarkable accuracy of the work done by this body of scientists 150 years ago, the altitude assigned for Chimborazo, which they calculated trigonometrically from a base line whose elevation had been established by mercurial barometer, was 20,592 feet; and now from Whymper's careful barometrical measurements the elevation is found to be 20,498 feet. Whymper's measurements were made by two mercurial barometers, carefully corrected at the Kew Observatory, in addition to which semi-diurnal readings of the barometer and thermometer were made at Guayaquil throughout his stay in Ecuador, thus enabling the most accurate calculations to be made. He also carried with him a number of aneroids, which were read daily at various elevations, and served to show how utterly unreliable these instruments are. He was able, however, to ascertain that some sort of regularity obtained in the error of each instrument, so that by long acquaintance with any particular aneroid some approximation to accuracy may be arrived at. One thing clearly shown is, that the air-pump test really indicates nothing as to the instrument's probable behavior under long-continued use at high altitudes. His examination into the question of boiling-point determination of elevation adds fresh confirmation to every careful experimenter's belief in its unreliability. The tables of air-temperature and body temperature in the high lands of Ecuador give further value to Mr. Whymper's work.

One object of his journey, of which he makes much, is the ability of the human system to accustom itself to the low pressures prevailing at high altitudes, but we do not feel that he has given us conclusive evidence regarding it. We know that he and his assistants were seized with mountain sickness at 16,664 feet, and in a few hours had recovered and were not again attacked, although they ascended to 20,498 feet, passed one night at 19,500 feet, six nights at 17,285 feet, and ten nights at 16,664 feet. While much has been claimed, we are not certain that any one has ever remained so long at the most excessive of these elevations; but many men have lived for weeks at elevations of 17,000 feet, and have exacted hard labor from workmen at that height. We know that there are mines in South America at an elevation of nearly 16,000 feet, and the Galera Tunnel on the Lima and Oroya Railroad, which is 4,000 feet long, is 15,645 feet above the sea, while the Galera Pass, which has been used for centuries, is 17,574 feet. The ability of men to work at such elevations is then clearly proved. The effect of low pressures upon the human system varies with the individual, and is as defiant of rules as the "snow line."

While the serious intent of the book is continually apparent, there is much sketchy narrative, which makes it a most interesting record of travel, and reveals incidentally the lives and customs of the people of these Andean valleys. It is pleasing to note Mr. Whymper's observation of the thirst for information among the common classes, which so many travellers have remarked as characteristic of the half-castes of other portions of the Andean region. Mr. Whymper's style is simple, direct, free from straining after startling effects; and in this very simplicity of diction there is often a majesty which is in perfect keeping with the sublimity of the scenes portrayed. Typographically the book is very handsome, and the illustrations are abundant and well executed. There is an ample index, an inset facsimile of Maldonado's Map of Ecuador, with a large route map, corrected by Whymper's own triangulations, folded into a pocket-cover.

ENGLISH WATER-COLOR PAINTING.

A History of Water-Color Painting in England. By Gilbert R. Redgrave. [Illustrated Handbooks of Art, edited by E. J. Poynter, R.A.] Charles Scribner's Sons.

MR. REDGRAVE has given us in a condensed form all that is historically known about water-color painting from the earliest times to our own day, with a complete biographical dictionary of the painters who practised this art and a history of the formation of the water-color societies. The space in which all this information has to be given is too limited for a subject so full of interest and which takes so prominent a place in the history of British art. Considering the many men of

distinct genius who have practised the art in a great variety of methods, we should have been glad to hear more concerning these methods, as well as further details of their lives, with statements of their relative importance and their influence on the painters around them. To Turner a whole chapter has been very properly devoted, but such names as Blake, Stothard, Rossetti, Frederick Walker receive but inadequate notice, a few lines being devoted to each.

Mr. Redgrave does not believe that the evolution of English water-color painting can be traced to the miniature-painters of the Elizabethan Age through the Dutch school of the seventeenth and eighteenth centuries, Adrian Ostade and his contemporaries and followers. He thinks it much more likely that they developed from the artisans who tinted maps, woodcuts, and engravings in the sixteenth century. This work was called "washing," and was done in transparent color. An authority of 1598, Master Richard Haydocke, who wrote 'A Tracte Containing the Artes of Curious Paintinge, Carvinge, and Buildinge,' says: "Of Distemper I note three kinds: In Sise used by our common painters upon cloath, walles, &c, In Washing with gummed colors, but tempered very thinne and bodilesse, used in mappes, printed stories, &c., And in Limming, where the colors are likewise mixed with gummes, but laied with a thick body and substance wherein much arte and neatnesse is required." Of these three methods the first remains the same to the present day, the common distemper-painting of the journeyman workman. From the second, "washing," was slowly developed, through the antiquarian drawings of topographers, the water-color painting of our own day; while the third, called by Haydocke "limming," is the tempera painting which the Egyptians practised so skilfully four thousand years ago, and the Etruscans and Romans also used for mural decorations. It was not until the brothers Van Eyck taught the use of oil as a vehicle for binding colors together that any other method of painting existed in Europe. Vasari relates how rapidly in his time oil-painting was taking the place of fresco and tempera in Italy. In tempera painting, white is largely mixed with the pigments to prevent the transmission of light from the ground, while, on the contrary, the ground should show through transparent washes in water-color painting as practised by the early painters in that medium. Raphael's cartoons at South Kensington Museum are examples of tempera painting on paper, while Mantegna's "Triumph of Julius Cæsar" at Hampton Court is painted on canvas in tempera also. The old illuminators of Church books, of which we have exquisite specimens of the fourteenth and fifteenth centuries, worked in tempera; so did the miniature-painters of the Tudor and Stuart times. These portraitists painted with white or body color, and used gold profusely in the ornamentation of their dresses and accessories; it was not till later on that large masses of transparent color were used for draperies, etc. Other changes in the method of miniature-painting took place in the seventeenth century.

It seems evident that the use of water colors was known on the Continent before Charles I.'s time. There is mention "of a limned picture . . . of the Emperor Rodolphus II. painted upon parchment being transparent, to be seen on both sides holding against the sky," the work of Frossley, imperial court limner during Rudolph's reign, 1576-1612. There is a fine collection of water colors by early Dutch masters at the British Museum, beginning in the middle of the seventeenth century. These Mr. Redgrave has studied carefully, and gives us some account of their methods. Adrian Ostade (1610-1685) is the best known. He used a ground of a gray tint, carefully drawing the outline of his landscape with a reed pen, and filling in the shadows with brown and gray—preserving the same chiaroscuro as in Dutch etchings. These studies of Ostade have much the appearance of monochromes which have been tinted subsequently. Fyt, Dusart, and Backhuysen are among the most successful artists in this style; but although after Ostade many changes took place, all artists used a gray ground and did not attempt pure local color on a white ground, which is the manner of the English school. For this reason Mr. Redgrave feels convinced that the English artists derived their practice of water-color art rather from the humble topographer than from the expert painters of the Continent. Dayes, a topographical draughtsman and miniature-painter of the early nineteenth century, published in 1808 a book of 'Instructions for Drawing and Coloring Landscapes' which has the details of the prevailing practice. Dayes, being a contemporary of Sandby and Cozens, would know their method, and therefore the water-color art of to-day must have been based on these precepts. Mr. Redgrave says:

"He describes very minutely the mode of laying on the colors in the different parts of the drawing; the shadows and middle tints, he tells us, should be made with Prussian blue and a brown Indian ink, the sky with 'Prussian blue rather tender,' the shades of the clouds with Prussian blue and Indian ink; and he advises working forward from the distance into the foreground, leaving out the blue in the advance until the foreground is reached, which is to be worked with brown Indian ink only. Finally, the darker parts of the foreground are to be retouched with Vandyke brown. This would seem to accord in every respect with the method pursued by Cozens in his best period, and it was on such a foundation as this that the true water-color art of to-day was based. While we may instance Cozens as a genuine exponent of the older school, we must concede to him also the credit of being one of the first to shake himself free from the traditions of the topographers and to exalt water-color painting to the rank of a fine art."

It is interesting to note the encouragement extended by wealthy patrons to this fresh development of art. William Alexander was chosen to accompany Lord Macartney's embassy to China in 1792; Cozens went to Italy to make sketches for Mr. Beckford. George III. was the patron of Paul Sandby, and the Earl of Warwick travelled through Italy with John Smith, who acquired from this time the distinctive title of Warwick Smith. The demand for book illustrations also contributed greatly to the success of water-color drawings. The publishers were employing many of the members of the Royal Academy at the time of its foundation, and we hear of Cipriani and Angelica Kauffmann as being especially successful at book work. The Royal Academy, founded in 1768, does not seem to have offered any very liberal advantages to water-color painters, for the miniature-room to which their work was consigned was a dingy room on a lower floor of Somerset House, which, besides the water colors, contained such pictures in oil as were not considered worthy of a place on the upper floor.

Among the men who seem to have been most prominent in the early stages of this art was Thomas Girtin, born in 1775. He pushed the practice of water-color painting to greater perfection than any of his predecessors. He studied the grander aspects of mountain scenery and finished his drawings directly from nature, which was an innovation at the time. His example seems to have had great influence on the rising school, although he died at the early age of twenty-seven. It is unfortunate that most of his drawings were burned in a fire at his brother's house, and that, owing to his constant use of indigo, which has been found to be a very fleeting color, many of the examples we possess are in a faded condition. Some unknown friend (and it is suggested that it may have been Turner) raised a monument over his remains in St. Paul's Churchyard. Ruskin, in a letter to Thomas Girtin's grandson, says of this artist: "He is often as impressive to me as Nature herself; nor do I doubt that Turner owed more to his teaching and companionship than to his own genius in the first years of his life." The art of Turner covers the whole epoch of the development of water-color art, his early studies being of the accurate, topographical style, showing little of the genius and originality of his later productions. From the time of his election as an Associate of the Royal Academy he gave up literal imitation of nature, and allowed his imagination to have full play; it tinged every subject he touched as with a magic brush. Through him water-color art in landscape reached its uttermost expression and perfection, and he discovered all its resources.

It was in 1802 that the water-color painters began to consider that it would be well for them to hold a distinct exhibition of their own, forming themselves into a society. They were some time deliberating this plan, which had been put forward by William F. Wells, fearing the antagonism of the Royal Academy; so that it was not till 1804 that the society was constituted, consisting of ten original members, namely, Hills, Pyne, Shelley, Wells, Nattes, Gilpin, Nicholson, Pocock, and the brothers John and Cornelius Varley. At their first meeting they elected by ballot six members: Barret, Cristall, Glover, Havell, and Rigaud. Shelley was elected treasurer and Hills the secretary. The rules were drawn up with exemplary prudence, the number of members fixed at twenty-four, the officers to be elected annually, and an annual exhibition of original works was determined on. Roget, in his 'History of the Old Water-Color Society,' which Mr. Redgrave has made use of for many important details, tells us that "out of the profits of the exhibition, should there be any after payment of expenses, a sum was to be set apart for the expenses of the following year, and the residue was to be divided among the members in sums proportioned to the value of the drawings sent and retained for exhibition." April 22, 1805, was the date of the first exhibition, in rooms in Lower Brook Street built by Vandergucht; the price of admission, one shilling, included the catalogue. An innovation which attracted attention was the presence of an attendant with price-list of pictures, who put down the names of buyers in a book and took a deposit of ten per cent. on the purchase money. No less than twelve thousand persons visited the exhibition during the six weeks it remained open, and the amount of money taken by the sale of drawings was £2,860. The average price of the drawings was about ten pounds, eleven shillings, according to Roget. The number of pictures exhibited was 275. After all expenses were paid, the members had a surplus of £272 to divide among themselves. The second year they elected associate exhibitors, who were limited to five works each, and they determined to elect two

new members from this class every year, until the full number of twenty-four was attained. The success of these exhibitions continued, the visitors and sale of pictures increasing, till 1812. It is characteristic of the more chivalrous spirit of that time that the one lady exhibitor, Miss Byrne, was exempted from any liability for losses which might arise, while accorded an equal share in the surplus money. The exhibitions increased in interest, as years went on, and frequently, almost yearly, changed their rooms; but after 1812 the public interest visibly declined, and the sales decreased so much that the members became anxious and called a meeting. Glover proposed that in future oil pictures should also be admitted to their exhibitions. This proposal, which nullified the very object of the society, was vigorously opposed by some of the members, who, on its being carried definitely, withdrew. The original scheme of exhibiting water colors alone was reverted to in 1821. Since that time the society, ever increasing in success and prosperity, has been established in Pall Mall East, and in 1882 her Majesty gave permission that it should call itself Royal.

Mr. Redgrave also gives us a full account of the origin and growth of the Institute, still another pure body of water-color painters; and he devotes a chapter to the materials used by those who practise this art and to the recent experiments testing the stability of water colors, with the conclusions arrived at by the Committee of Experts. After the endless and excited discussions of a few years ago between the chief authorities on the subject, it will be reassuring to those who paint and those who buy water colors to learn that, after the severe tests the colors were put to, they are fully as permanent as, and less exposed to risks of change than, oil colors. The book is full of interesting facts too briefly told to make it very readable, but for reference it will be found most valuable. The illustrations are from the splendid collections of South Kensington and the British Museum.

WAGES.

A treatise on Wages and the Wages Class. By FRANCIS A. WALKER. 8vo, $1.75.

MONEY.

By FRANCIS A. WALKER. 8vo, $1.75.

HENRY HOLT & CO., N. Y.

Far from To-day.

Although these six stories are dreams of the misty past, their morals have a most direct bearing on the present. An author who has the soul to conceive such stories is worthy to rank among the highest. One of our best literary critics, Mrs. Louise Chandler Moulton, says:

"I think it is a work of real genius, Homeric in its simplicity, and beautiful exceedingly."

FAR FROM TO-DAY. By GERTRUDE HALL. Price $1.00. ROBERTS BROTHERS, Publishers.

"The weary brain requires some nerve sustaining element as food."—HERBERT SPENCER.

Crosby's Vitalized Phosphites.

The vital principle of animal and vegetable life isolated from the ox brain and wheat germ.

The loss of memory, the tired and exhausted feeling, the dull, unrefreshed sleep, or nervous sleeplessness, brain weariness, depressed vitality, are simply the brain and nervous system calling for their necessary food. In this condition the Vitalized Phosphites give great relief. It restores the true protagon, the brain phosphoid, increases brain and nerve power by specially feeding the nerve centres. It reinvigorates brain and body.

For thirty years endorsed by leading physicians and the world's best brain workers. Formula on the label. Pamphlet free to those who write for it. Druggists or by mail, $1.00. 56 W. 25th St., N. Y. *F. Crosby Co.*

Siglar's Preparatory School

($600), Newburgh, N. Y.
Opens September 14. No rooms kept for boys not arranged for. HENRY W. SIGLAR.

[*Continued on page v.*]

The Nation.

NEW YORK, THURSDAY, AUGUST 4, 1892.

The Week.

PRESIDENT HARRISON is entitled to credit for his veto of the McGarrahan Claim Bill. His reasons for the veto are well stated and are ample for all the purposes of justice. The McGarrahan claim itself might be quite meritorious without in any way justifying this bill, which proposes to put upon the United States all the cost of settling a disputed land-title between private parties. It looks as though McGarrahan had bought off the opposition of the New Idria Company by agreeing not to contest their claims or to ask a cent of money from them, but to take it all out of his uncle, or his adopted uncle, Sam. As to the merits of the claim, the public at large cannot possibly form a judgment, owing to the mere length of time during which it has been pressed. McGarrahan's pretended patent goes back to the year 1863. Any one who retraces the scandalous history of his appeal from the courts to Congress in 1869, will conclude that the President had no occasion to give any reasons for checkmating a fraudulent raid upon the Treasury. The claim was vigorously opposed by Gen. Garfield in the House, and it was one of the causes of Gen. Cox's resignation in 1870 that President Grant was induced by McGarrahan at Long Branch to overrule the Secretary of the Interior's decision to pass upon the claim of the New Idria Company.

Senator Carlisle's answer to Mr. Aldrich has stirred up the Republican brethren mightily, and they are not so content as they professed themselves to let the Rhode Island Senator's speech go out as the "keynote of the campaign." In fact, they now find that keynote to be decidedly off the proper pitch, and are trying in various ways to sound it so that it will be free from suspicious quavers and crackings. Senator Sherman reverted to the ancient melody in praise of dear goods, and said that Mr. Carlisle's demonstration that the McKinley Bill had increased the cost of living had no terrors for him, inasmuch as he was far from sure that cheapness was desirable. On Monday our own Senator tried his mouth at the keynote, and took the position that, since a large part of the increase of the cost in living was due to enhanced prices for agricultural products, the McKinley Bill could not be held chargeable for that advance, because "the prices of agricultural products are not really affected by the tariff legislation of 1890." This is rather hard on Senator Aldrich, "Uncle Jerry," and the *Tribune*, and their assertions that McKinley had put millions of dollars into the pockets of the farmers. It is hardest of all on the New York Senator, who, two years ago, developed such a consuming interest in the farming population, and so emphatically said that the McKinley Bill was solely for their benefit, that he was at once dubbed "Farmer Hiscock." Altogether, the Republican choir is producing a fearful discord in its efforts to strike a keynote.

The speech of Senator White of Louisiana on the Anti-Option Bill is masterly, and defies synopsis or condensation. One branch of it deserves more notice than it received in the telegraphic summary. It was that which shows how the Minneapolis millers are interested in preventing option sales, since these have the effect to sustain the price of wheat immediately after harvest, when a great deal comes on the market, and when, if there were no option trading, the price would inevitably be forced down and the millers be enabled to get what they want on their own terms. The witness chosen by Senator White to prove his case was Mr. Pillsbury, the leading miller of Minneapolis. Mr. Pillsbury's testimony was given before the House Committee on Agriculture. He was asked what was the usual course of the market before option trading was introduced, and he replied that the millers generally accumulated their stocks while the farmers were selling their surplus rapidly. "The almost universal rule," he said, "used to be that you could buy the wheat cheaper at that time than at any other time." Again he said: "There was a time when the millers could always run on a profit years ago by buying wheat in the fall, say on an average of one dollar per bushel, and we were almost sure to make a good profit by carrying it until the time when the state of the roads, etc., prevented the deliveries being so large. I look on short selling as being the greatest impediment to the profit of the milling business in that way." Of course short selling and long buying go together, and the two things tend to equalize prices throughout the year—*i. e.*, to minimize the fluctuations, so that the farmer can get what his wheat is fairly worth at one time as easily as at another, regardless of the state of the roads. When Senator White quoted this testimony of Mr. Pillsbury, he took pains to say that he acquitted Senator Washburn of any other than a public interest in this question. Indeed, the Louisiana Senator was so profuse in personal disclaimers as to leave the impression that he considered Mr. Washburn the only perfectly disinterested miller in the country.

The result of the Alabama election on Monday is no surprise to those who have watched the progress of the campaign, for the success of the regular Democratic ticket has seemed assured all along. The Alliance movement in that State has been a noisy one, but it has proved only another case of "great cry and little wool." The overwhelming majority of the whites have voted the regular ticket, as was to have been expected, and this ticket appears to have received quite as many negro votes as the other one. This is not strange, for the Alliance side had nothing more to offer the blacks than the regulars. Northern Republicans cannot criticise the course of the negroes, for they consider the Alliance party so ridiculous that intelligent men ought not to support it, and they cannot afford to claim that the negroes are so ignorant that they should have been expected to support it. After this Alabama election we shall probably hear no more of the claim that the Alliance will carry any Southern State next November.

Secretary Foster's performance in appointing to the position of Immigrant Inspector at Baltimore an alien, who was brought to this country from Wales recently as a tin-plate worker in order to help in establishing the American tin-plate industry, is a thoroughly characteristic performance. It is similar to his selection of Schulteis as Special Immigration Commissioner. He made both appointments at the solicitation of men whom he supposed to be genuine representatives of Labor, but in both instances he discovered subsequently that he had been imposed upon. There is something delightful in the idea of pleasing American workingmen by giving a public office to a Welsh tin-plate worker who has not been in this country long enough to become a citizen, and who has been brought here to assist in establishing an industry which American workingmen are taxed to bring into existence.

It is gratifying to know that one class of intending swindlers under the McKinley tariff have not been able to carry out their intentions. We refer to the would-be makers of cotton hosiery who prevailed upon McKinley to raise the duty on those goods from a plain 40 per cent. ad valorem to a mixed ad-valorem and specific rate equal to 55 or 60 per cent. They made extensive preparations to levy their private tax on the consumers at the new rate, but the German manufacturers hit upon the plan of sending their goods uncolored, the profit on the dyeing and finishing being left to people on this side of the water. "The injury inflicted upon the domestic maker by this move," says the *Wool and Cotton Reporter*, "was deep, and it has given them a grievance which they are not likely to forget." We should say that it was a case where one set out to gather wool and came back shorn, and as it was not his own wool that he was trying

to bag, he is not likely to find much sympathy; certainly not enough to get another advance in the tariff, which the *Reporter* suggests as the suitable remedy.

Four million dollars in gold was sent out to Europe by Saturday's steamers; an apt commentary on the efforts of certain enthusiasts to "obstruct" the foreign gold movement. It appears that Treasury notes and gold certificates served equally well the purposes of shippers in drawing gold from the Treasury, while the advance in local interest rates, which a group of bankers were to effect by calling in loans, in order to make gold shipments unprofitable, has turned out so amusing a fiasco that to-day loanable money is more plentiful in New York and money rates actually lower than they were when the experiment was begun. There is another striking fact in connection with this shipment. Week before last the foreign bankers drew heavily for exchange on their New York correspondents, and these much-berated exporters actually delayed meeting the drafts, in the hope that they could be "covered," as they were a year ago, in ordinary bills of exchange offered against prospective grain exports. The delay was fruitless, for no bills were to be had, and thus the closest analysis of the market has shown the gold exports to be transactions entirely in the line of legitimate trade. But if any patriot wished to be cheered up under these depressing circumstances, he should read the remarks of that eminent statistician Mr. Funston, in his report for the minority of the House Agricultural Committee. Pointing out that the fiscal year's merchandise exports exceeded the imports by $202,944,342, Mr. Funston concludes, cheerily, that we thus learn "that a large amount of the world's gold has been placed to our credit, if not actually landed on our shores and coined into currency." The McKinley tariff, he therefore infers, "has taken a long step towards a solution of the question of American currency by bringing to our country in one year enough gold to supply every man, woman, and child with $3.25." The only question remaining, after this lucid demonstration, is when the distribution of the European gold will begin.

Those who have believed that the European alarm over our currency situation ceased with the shelving of the Silver Bill will be somewhat disturbed by the recent utterances of the London papers. In the two leading financial weeklies of that city, just received by mail, the silver question is brought to the front in such a manner as to reflect grave uneasiness in the banking community. One of these journals devotes to the silver situation in the United States no less than three editorial articles, which are despondent to the last degree. They were written more than a week after the House of Representatives had buried the Stewart Bill, yet there is not a single allusion to that incident. This is of itself significant. Foreigners weighed very justly the chances of enactment of that measure. Its passage in the Senate was greeted neither by a fall in the London security market nor by a rise in the London silver market. It is, in short, not alone the possibility of American free silver coinage from which foreign observers read disaster, but the actual state of affairs as it now exists. Free coinage would make the situation worse, in the view of these critics; but with or without such a measure the outlook is very grave.

The Republican Convention in the Portland (Me.) district, which renominated ex-Speaker Reed the other day, adopted a platform which "points with pride" to the McKinley Law, and felicitates the country upon the fact that, under the operation of that law, "our imports, which Democratic orators said would shrivel, have increased to a point never before reached." This is a most extraordinary deliverance. It was *Republican* orators who said that under the McKinley Law imports would shrivel, and who declared that it would be the best thing possible for the country to have them shrivel. It was Mr. Aldrich, the manager of the bill in the Senate, who said:

> "I am in hopes that the general effect of this bill will be to decrease relatively the importations. I am in hopes that the ultimate result will be to reduce the relative importation of those goods and increase our own manufactures."

It was Mr. McKinley himself who said:

> "The chief complaint against this bill comes from importers and consignees here, on the one hand, and the foreign merchants and consignors abroad. Why do they complain? Manifestly because in some way this bill will check their business here, and increase the business of our own manufacturers and producers; it will diminish the importation of competing foreign goods and increase the consumption of our home-made goods. This may be a good reason to influence the foreigner to oppose its passage, but is hardly a sound reason why Americans should oppose it."

It is not yet two years since the law was passed, and yet Republicans now claim credit for it, not on the ground that it has diminished the importation of foreign goods, but that it has promoted such importation; and they even go so far as to "arraign" the Democrats for having predicted that it would restrict the entry of foreign-made goods, when it was their own orators who made the prophecies, and who congratulated the people upon this assured effect of its enactment.

There are conflicting reports as to the latest phase of the efforts which have been in progress so long to "placate Platt." Some accounts say emphatically that he is now certain to "get what he wants," and others say that there has been no change in the situation, and that he is still waiting to hear from the President. Of course these are only unauthorized statements as to the exact nature of the thing that Platt wants, but the best expert opinion inclines to the belief that it is not so much offices for others as an office for Platt himself. The following passage in one of Monday's Washington accounts of the situation gives a pretty plain hint as to the nature of the office which Platt has demanded: "A very serious report came from a Republican yesterday, who, in the last week or so, has conferred with the President. It was to the effect that certain changes in the Cabinet will be made in the event of Harrison's reëlection, if not before election." Platt has made no secret of the fact that he was given to understand by Harrison's representatives in the last campaign that he should have the Secretaryship of the Treasury, and that he regards the President's failure to offer it to him as an unpardonable breach of faith. He would probably not be content with a simple promise again, but would insist upon something more trustworthy. Of course a reorganization of the Cabinet which should put Platt into it before election would be much more acceptable to him than a promise.

The decision of the Michigan Supreme Court declaring unconstitutional the Redistricting Act for Senatorial and Representative districts, on the ground that it was an outrageous gerrymander, is to be heartily welcomed. There is nothing partisan about the attitude of the court, for at the same time that it thus overthrows an act of the last Democratic Legislature, it annuls for the same cause the gerrymandering act passed by a Republican Legislature in 1885. By the way, the Philadelphia *Press*, which has been asking for evidence that Republicans have been serious offenders in the matter of gerrymandering, may find what it sought in this decision.

Some temporary inconvenience has been occasioned in holding the elections both in Michigan and in Wisconsin on account of the decisions of the courts of those States that their recent division into electoral districts was so inequitable as to be unconstitutional. A special session of the Legislature of Michigan has been called for the purpose of correcting the apportionment, and the same course will be adopted, probably, in Wisconsin. This has been thought expedient, as it was not improbable that the Republicans might gain some party advantage by having the elections conducted according to the preëxisting divisions, which, if unequal in population, might be held to have become so by natural growth and not as the result of gerrymandering. While it is true that good government may be obtained through representatives having constituencies of very unequal size, yet it is in accordance with the spirit

of our democratic age that the population of the representative districts should be substantially equal, and it is a wholesome thing for the courts to warn the party leaders that they are not to disregard this requirement. It is pretty safe to say that the courts will not hold an apportionment unconstitutional except upon very good grounds, and the decisions in Michigan and Wisconsin ought not to be without effect upon the whole country. If the Democrats lose in these States by these decisions, they have only themselves to blame, and must learn to be content with what they are fairly entitled to. It is frequently the case that an attempt by a party majority in a legislature to gain seats by marking out districts inequitably causes such general disgust among voters as to reverse the relative strength of parties, and it is rather strange that party leaders are unable to see that in redistricting, as in other things, honesty is the best policy.

The Massachusetts Corrupt Practices Act, which was passed by the recent Legislature of that State, went into effect on August 1. As we pointed out at the time of its introduction, it is a stringent measure in some directions, but seems to have loopholes which will prevent its complete success in practice. It requires strict accountability and sworn publication, by candidates, committees, and organizations, of all moneys received and disbursed, except that candidates may omit personal expenses from their returns. The most serious defect in the law is that, while forbidding the solicitation of contributions from candidates, it stipulates that any candidate "may make a voluntary payment of money or a voluntary and unconditional promise of payment of money to a political committee for the promotion of the principles of the party which the Committee represents, and for the general purposes of the Committee." This seems to recognize and perpetuate the "assessment" evil, which is the most pernicious of all the corrupt uses of money in nominations and elections.

It is a noteworthy and encouraging fact that the mortality due to a "hot spell" in this city is, proportionally to population, far less now than twenty years ago. Dr. Tracy of the Health Department points out that in one July day in 1872 there were 172 deaths from sunstroke, all of the victims dying within twenty-four hours after they were stricken, and nearly half of them in three hours' time, and that on that day there were 357 deaths from all causes, while "we thought the other day that 260 deaths were something awful," although the city is nearly twice as big now as it was then. The Doctor attributes the improvement to the fact that people have learned to take better care of themselves; that many who would have drunk considerable liquor in the early 70s do not touch it at all now; that many of those who do drink take beer instead of whiskey; that non-intoxicating drinks, such as mineral waters, lemonade, milk, etc., are sold, even in the saloons, far more generally than formerly; and that the summer diet is more sensible now than it used to be, especially in the immense growth in the consumption of fruit. So much folly in sanitary matters thrusts itself upon the public notice that it is gratifying to have such a demonstration as the vital statistics of the past week present that the mass of the population are really coming to live more sensibly.

If there is even a moderate basis of truth in the stories now coming from Russia, the situation of that State must presently be such as has no parallel in the history of modern Europe. That several districts are already overrun by the cholera epidemic, and that other districts are so utterly prostrated by famine as to make an early industrial revival out of the question, seems to be clearly proved. The information has not come through official sources; indeed, the authorities at St. Petersburg are preserving now the same silence as a year ago. It has been shown since then that the Government itself was not aware of the failure of the harvest of 1891 until measures of relief were almost too late, and that this was due to the preposterous system of red tape in the imperial administration. Provincial officers had grown so used to pigeon-holing appeals and complaints that they cast aside as petty annoyances the addresses of local assemblies who saw the coming ruin; so that what wheat there was had been cornered by greedy factors, and the horses and cattle of the famine district seized for debt, long before the Czar and his Cabinet awoke to the crisis. It is impossible that equal ignorance should prevail regarding the cholera; but no official statement comes from St. Petersburg, and the truth can be guessed at only by the panic among those who must know the facts. That most stringent measures have been adopted by Russia's western neighbors to stop the infection at the frontier, and that foreign merchant-ships are refusing to touch at Odessa, are facts which show the feeling of Europe on the question. If a national epidemic were to follow a national famine, the results upon Russia's future could not fail to be of grave significance. The internal afflictions have saddled enormous expenses on the Government, and the public revenue is crippled at the same time. The Government's financial statements defy analysis; yet even they have been forced to admit that revenue is running so far short of expenditure that further borrowing must be resorted to. The London *Economist* lately estimated from the Russian Finance Minister's statements that the year 1891 showed an actual deficit of $58,000,000. Famine relief expenditures, according to the same authority, must since then have reached $150,000,000, and are going forward now at the same rate. Yet the unused surplus of foreign loans, at the opening of the year, was only $170,000,000, including $60,000,000 which may not yet have been received from the proceeds of last fall's Paris loan. Of this loan, indeed, which broke down so sensationally, London writers say that all but a fraction remains still unsold in the hands of the negotiators.

The ministerial crisis in Norway has at last reached its only possible conclusion; the King has recalled Steen, and the question of a separate Norwegian consular service is to be reconsidered, which means its acceptance. This is the story of all proper demands on the part of the Norwegian Parliament. At first opposed by the King, they have finally been granted whenever popular opinion has been overwhelmingly in their favor. While this latest claim was made to a certain extent a party question, many Conservatives undoubtedly gave it their support. During the past thirty years the commerce of Norway has been fast outstripping that of her neighbor and confederate, until at present she ranks as one of the first commercial Powers of Europe. Conscious of their actual commercial superiority, the Norwegian people naturally chafe under a system that gives to the Swedish Foreign Office absolute control over the consular service of both countries. While continued opposition might not, as many feared, have dissolved the Union, it would undoubtedly have increased still further the hostile feeling to Sweden which radicals like Björnstjerne Björnsen are doing their best to foster

---

An old Liberal points out in the Berlin *Nation* that it is only retributive justice which has overtaken Bismarck in his controversy with the Emperor. If that young man now acts as if he believed himself to be the Anointed of the Almighty, before whom all private and national wishes and interests must give way, he is but executing the teaching of the ex-Chancellor himself. The prerogatives of the Crown have never been more stoutly asserted than they were by Bismarck in the days when he had his own way with the Crown, and did not need to distinguish between its prerogatives and his own. More than once did he face a hostile majority in the Reichstag with the assumption, open or tacit, that popular representation was only a convenient way of getting the nation to acquiesce in the Emperor's will, which, after all, was the supreme law. That young William should have taken all this seriously, and applied Bismarck's teaching to Bismarck himself, puts him almost in the light of a Greek Nemesis.

SENATOR ALDRICH'S SPEECH.

It is Senator Aldrich's own fault if the reputation he has acquired as the great Republican "tariff expert" is largely that of an expert juggler with figures. If we were roundly to denounce as fraudulent the statistics which he brought forward in the Senate on Wednesday week, we should only be following his example; for no man ever surpassed him in repudiating figures which make against him. He now confidently adduces statistics furnished by importers, the Bureau of Statistics, United States Consuls, and the Department of Labor, yet in the course of the tariff debates of 1890 he cavalierly declared all these authorities to be unworthy of trust. On August 22, 1890, he said, when referred to Mr. Blaine's famous statistics relating to cotton manufactures in England: "I will simply reply that the statements are not correct." On July 26, he said: "If the Senator follows the statements of importers, he will find himself very often misled." Later in the debate of the same day he affirmed: "Nothing can be more misleading and uncertain than the average ad-valorem rates based upon data furnished at the Treasury Department." The labor-cost of steel rails as stated by Commissioner Wright, whom he now holds up as the highest authority, he flouted with similar contempt when the iron and steel schedules were under discussion.

Some other statements of his must be referred to while dealing with the question of his consistency. Alluding to the matter of tin plate, he said last week:

> "When the act of 1890 was before the Senate, I expressed great confidence that within three years, if the tin-plate duties were imposed, a considerable portion of the tin plate consumed in the United States would be of American production. I have no reason whatever to change the views then expressed. Everything that has happened since confirms their correctness."

The Senator is hardly accurate in recalling his own predictions on this head. On August 19, 1890, he said in reference to the provision that by 1897 the home production must equal one-third the importations: "I have no reasonable doubt that the American producers of tin plate will manufacture a very much larger proportion in every one of the five years than one-third." According to the statistics which he himself now brings forward, the proportion for the first year is actually less than one-fiftieth instead of one-third. This is the way that "everything that has happened since" has "confirmed the correctness" of his predictions of two years ago. The result must make him a little shaky about that other risky affirmation of his on September 30, 1890: "I am quite willing that the future of the protective policy should depend upon the success or failure of the duty imposed by this paragraph" (the tin-plate duty).

Mr. Aldrich, like his party, has got bravely over his scorn of cheap goods. In the face of his own avowal, made over and over again in the course of the debates in the Senate two years ago, that the higher rates of duty were intended to be "protective" against "the uniform and persistent decline in value during the past twenty-five years of all manufactured articles," he now glories in the fact that a decline in general prices of 64-100 of 1 per cent. occurred in the year following the McKinley Bill. It remains, nevertheless, to ask what the rate of decline was before the McKinley Bill, and what effect that measure had upon a movement towards lower prices for consumers which had been going on for a generation. All economists of standing now admit that for many years the prices of commodities have been declining while wages have been increasing, relatively or absolutely, and in a speech in reply to Mr. Aldrich on Friday Mr. Carlisle undertook to show that the "tariff act of 1890 had interfered with the natural tendency." In proof of this contention, he adduced prices and figures gathered by the Finance Committee going to show that the cost of living in the United States had increased during the period covered by the investigation, taking that period as a whole, and not singling out one day alone for comparison, as Senator Aldrich had done. Then he delivered a knock-down blow by showing that the increases in wages discoverable by the Committee had been mainly in unprotected industries, while in protected industries wages had, as a whole, declined under the operation of the McKinley Bill. He took fifteen cases of unprotected labor and showed that in them wages had advanced 75-100 of 1 per cent., and then proved that in fifteen instances of protected labor wages had gone down 89-100 of 1 per cent.

We for our part will cite the testimony of an expert who will be recognized as unimpeachable by Senator Aldrich. We refer to Col. W. M. Grosvenor, one of the editors of the *Tribune*, who published in that journal on January 3, 1890, under his own name, an interesting statement of the decline in prices which had been going on for some time. He said: "From January 27, 1888, to June 3, 1889, the decline was about 14 per cent." That is to say, his investigations ended at the very month when the Senate Finance Committee took up theirs. Mr. Grosvenor took a period of eighteen months, and found a decline in prices of 14 per cent. The Senate Committee chose a following period of twenty-eight months, and found a decline of 64-100 of 1 per cent. Why this great contrast? What stopped the decline? Could it have been the McKinley Bill?

Now, if the Republicans continued to talk as they did two years ago, this showing would be a great triumph for them. They then saw great dangers in cheapness. Prices were perilously low, and manufacturers were not making any money. The tariff must be put up and prices with it, so that they could make more. We say that if the Republicans had not abandoned that position, they could now point to their handiwork and say: "See what we have done. Prices were declining at the rate of 14 per cent. in eighteen months. Our tariff has checked that ruinous decline, and done it almost completely in spite of the continued decrease in the cost of transportation and production." There could be no reply to that. But the Republicans have suddenly found out that they are great friends of cheapness. Their McKinley Bill was specially designed to lower prices. If that is the case, what an egregious blunder it was! While they were letting the tariff alone prices were going down rapidly; their tinkering with it has almost entirely stopped the decline. If they are really advocates of low prices, they ought at once to repeal their bill and restore the old rates, under which their now lauded, but then reprobated, cheapness was in full swing.

In Senator Vest's brief rejoinder he accurately expressed the sentiment of his party in welcoming the fullest and sharpest discussion of the tariff in all its antecedents and all its effects. What honest men want is trustworthy facts honestly and intelligently interpreted; and the more of them we can get the better. We regret to add that Senator Carlisle showed Senator Aldrich to have been guilty of two disreputable tricks. That gentleman brought forward, as if with the sanction of the Finance Committee, certain alleged facts relating to the cost of living in England, and also as to prices in this country in May, 1892. Mr. Carlisle stated, and was not contradicted, that "the Committee had made no investigation whatever concerning the cost of living in England," and that he had learned of the "investigation" into prices in May, 1892, "for the first time when he had seen the statement in print." If Senator Aldrich has any explanation to give for this shameless attempt to impose upon the public, he ought to lose no time about it.

CONNECTICUT'S BALLOT LESSON.

The findings of fact in the Phelan case, as made by Judge Hall in the Superior Court of Connecticut, are the result of what has probably been the longest, most vexatious, and most complex election trial ever held in this country. The case has been in court about a year and a half, and continuously under trial for some six weeks; hearings had to be held in several parts of the State, and the summoning of about 500 witnesses and the investigation of the count at more than 200 voting-places became necessary. The chief value of this sharp judicial scrutiny is the light it throws on the general subject of secret-ballot laws, and especially on the unwisdom of the hybrid type of statute which Connecticut adopted in 1889, and to which must be charged the disgraceful

state of affairs existing in that State today.

Let us take a single branch of the outcome of this statute as set forth by the findings of Judge Hall. In the suit of Talcott against Philbrick, wherein Governor Bulkeley figured so discreditably, the Supreme Court of the State, interpreting the new Ballot Act, used these words:

"What is the ballot? It consists not merely of the paper of the prescribed size and quality, but also of the required printing thereon. If the name of the party may be omitted, so may the name of the candidate or office. *If either of the last two is left out, its validity as a ballot is destroyed.*"

The italicized words seem to make it as clear as the English language can that the Connecticut ballots must be issued primarily in legal form—that is, with the places of all the candidates filled and with no blanks whatever, if they are to be valid; and subsequent to the election Judge Hall himself, in the East Lyme Judge of Probate contest, held this view, and went still further in saying that the filling of the blanks by "pasters" did not validate the State ballot on which, under the Connecticut law, the name of the candidate for Judge of Probate is printed. Now, the Talcott-Philbrick decision of the Supreme Court was rendered in September of 1890, or only about two months before the State election of that year. One would think that it constituted sufficient notice to the political parties who print and distribute the Connecticut ballots that they must contain a full list of candidates.

What were the facts? Of the Prohibition ballots, some 3,500 in number, thrown at the State election of 1890, nearly two-thirds were left blank as to Judge of Probate. All the "Labor" ballots, 209 in number, had the same defect, besides a blank under the title of State Senator. In nine towns the Democratic ballot had the same flaw, which, accepting the Supreme Court's language, will invalidate some 1,500 ballots. Altogether nearly 4,000 ballots out of about 135,000 thrown in the State bear this defect, or say 3 per cent. Could any commentary be more conclusive as to the arrant folly of letting the party managers prepare the ballots as the Connecticut "envelope" system allows to be done? Strangely enough, too, the Town Moderators, although they threw out many ballots for causes legal and illegal, did not exclude one on the "blank" ground which the Supreme Court of the State had set forth so recently and so strongly, and which has been a leading point of contention on both sides in the long Phelan case.

This error as to blanks, though the most serious in the election, was but one among many. Sixty Democratic ballots in the town of Hartland bore the name of the party candidate for Senator in another district. All the eighty Democratic ballots in the town of Lyme had a mark erasing a wrong letter in a candidate's name. Forty ballots in Litchfield bore the name of a candidate irregularly spelled. There were 126 Republican ballots in Bridgeport which the Chairman of the local Republican Committee allowed to be given out with broken type-marks upon them, which the Supreme Court may hold to be fatal to validity. There were 129 Republican ballots in North Canaan issued with the name of Judge of Probate in handwriting. There were ballots folded in a peculiar way, ballots "distinguished" by pasters with strange names over certain minor candidates, ballots folded with political circulars in the "official" envelopes, and other errors corrupt or accidental, but all directly due to or greatly facilitated by the fact that party managers, instead of sworn election officers, gave out the ballots. This has been the fatal defect in the present Connecticut election law, signed by Gov. Bulkeley after his veto of a bill providing for a genuine secret and official ballot act modelled on that of Massachusetts.

In its party aspects the decision of Judge Hall is a sharp rebuke of the Republican rascality which kept out the minor Democratic State officers in order not to "hamper" Bulkeley's administration. By the Judge's finding as to law, Phelan's prima-facie majority of 544 is but slightly reduced, and can hardly be overcome by any decision which the Supreme Court may make next September on the many and varied points of law involved, and it may be actually increased. Only a single vote is changed among the 509 "doublet" ballots on which the Republican House during the long deadlock has based its argument for keeping Phelan out. The complexities of the case show also the utter absurdity of the Republican idea that two partisan legislative bodies could undertake the investigation of the ballots all over the State and reach any practical results. The whole Democratic State ticket, with the exception of one candidate, who is dead, is almost sure to be renominated, and at the coming election we shall have a most valuable test as to how far the Republican knaveries have touched the electoral conscience of a New England State.

But the prime lesson from the Connecticut case is a broader and deeper one than party or locality. The Secret-Ballot Act of that State was one of those hasty and loose-jointed laws expressly devised by the politicians as a substitute for Australian voting, for ballots really official, and for the prevention of bribery and terrorism. They intended to pass such a law as could easily be violated and dodged, and they have succeeded at the cost of the good name of the State, have deadlocked the Legislature, and have brought about a condition of executive affairs which, at times, has very nearly approached chaos. If here is not a warning against the half-baked measures by which the politicians try so hard to cripple the Australian system, we do not know where such a warning can be found.

THE GLUT OF CAPITAL.

THE low rate of interest has been made the theme of an interesting debate in the Political Economy Society of Paris. Many opinions were expressed, but that of M. Paul Leroy-Beaulieu was the one best supported by the evidence. He quoted the fine simile of Turgot, who described the rate of interest as a species of level, below which all work, all culture, all industry, all commerce, cease; while as it sinks like the surface of a receding flood, first mountain-tops become fertile islands, then plateaus and plains and rich valleys become available for production. But the comparison is not altogether accurate, for while a low rate of interest makes greater production possible, it implies under some circumstances a less proportional return for labor.

For if we inquire why capital is remunerated, the only answer is because it is productive, and if the rate of remuneration declines, other things remaining unchanged, it is evident that capital is becoming less productive. That this is the case in old countries like France, M. Leroy-Beaulieu furnished much evidence to prove. Such a country is approaching the "stationary state." The inhabitants of a long-settled territory, after a period of peace and civilization, come to be in the position of a well-to-do citizen who has adjusted himself to his surroundings and adjusted his surroundings to his own wants. He has a house which he has gradually adapted to his use, he has furnished it to his taste, his grounds and outbuildings are substantially finished, he has introduced water and provided drainage, he has a suitable equipage, and there is not much, except current expenses, upon which it is very necessary for him to spend any considerable sums. Were he to do so, the gratification he would derive would be in a diminished ratio to the expenditure, which is precisely analogous to a lessened return upon the capital of a nation.

In a long-settled country like France, the system of highways is practically complete, and most of the necessary railways have been constructed. Suitable public buildings have been erected, and such drainage and waterworks as the sentiment of the country demands have been supplied. Of course there is an indefinite field for future improvements, but these improvements are not indispensable; they are of the nature of luxuries rather than necessaries. Accordingly of late years even the French Government has admitted that the main features of its extravagant scheme of internal improvements have been completed, and has decreased the amount of its budget. The signification of this is that the field for the productive employment of capital has been narrowed; that new investments of capital are less productive than formerly. There will be new railroads built, but they will have less advantageous lines than the old. There will be new mines opened, but they will not be so rich as those that have been worked. The canal through the Isthmus of Suez

proved profitable, but that attempted at the Isthmus of Panama has shown that such profits are not necessarily to be derived from similar works in the future. In corroboration of these propositions, M. Leroy-Beaulieu enumerates the financial institutions, such as the Comptoir d'Escompte, that have collapsed and disappeared of recent years in France without being replaced by others, or that have been reorganized with diminished capital. Some new institutions, it is true, have been created, but they are comparatively insignificant, and, almost without exception, their stocks are below par. Such new railroads as have been built since 1871 are supported only by guarantees. They may amount in length to 20,000 kilometres, and on not more than 3,000 or 4,000 is the traffic sufficient to bring any return to the capital invested. In general, M. Leroy-Beaulieu concludes, after a careful survey of the principal channels followed by capital, that the investments of the last twenty years have been notably inferior in their financial results to those of the twenty years preceding.

Turning to England, we learn from the *Economist* that the channels of investment for capital have been greatly narrowed. Fewer foreign loans have been made, fewer railroads have applied for additional capital than formerly. The total called for in 1891 was £105,000,000 against £143,000,000 during the previous year, and £190,000,000 in 1889. Moreover, in spite of the current low rates of interest, the foreign and colonial borrowers have had to accept harder terms, showing that it is not thought that their use of new money will be so productive as their use of that which they have hitherto expended. The Dominion of Canada sold its bonds this year for 92 per cent., while in 1888 it got 95 per cent. The same thing took place in Indian stock, the minimum being fixed at 94, whereas two years ago it was 99 per cent. It is but three years since the Australian colony Victoria received over 103 for a loan, while this year it has been obliged to place the minimum as low as 92 in order to borrow what it wants.

In point of fact, if we take a survey of the world, the field for investment has been in many ways greatly narrowed. Most national governments have shown the tendency long since remarked by Adam Smith, and borrowed until they were either bankrupt or so near it that no one would lend them any more. The English investor has tried every government under the sun, and, after a tolerably uniform experience of disaster, has about stopped lending for lack of borrowers not already in default. Little more money will go for the present into South America, not much more to Canada or to Australia or to India, until the silver problem is settled. Italy has reached her borrowing limit, and Russia has passed it. Spain and Portugal can offer no inducements, and it might almost be said that there is now not a government that has any occasion to borrow that could do so to advantage. And what is true of governments is to a considerable extent true of the corporations within their limits. While it is a fact that in many parts of the world there are still great opportunities for the employment of capital, yet these opportunities are not upon the whole equal to those that have already been utilized, nor are they relatively so numerous as before. Even where these opportunities are as extensive and intrinsically attractive as in this country, there are a good many reasons why foreign investors should prefer to keep their money in their own hands. As we pointed out a year ago, if we should come to a silver basis, it would ruin most of our railroads, for they would be prevented by existing statutes from charging more than certain prescribed rates, which they would receive in silver, while all other prices would rise. We may feel now that we have escaped this danger, but it will naturally be some time before we can impart this confidence to foreigners.

ENGLISH ELECTIONEERING DODGES.

THE brutality which marked the late electoral contests in Great Britain was no novelty in English methods of political warfare, and therefore need not be dwelt upon; but some of the more amusing electioneering contrivances resorted to, and strange electoral results arrived at in consequence, are worth remarking. The stringency of the Corrupt Practices Act makes even indirect bribery of voters a perilous business, and is responsible for some of the shifts adopted. It is an old trick, however, for candidates to "identify themselves with local institutions," or, in plain English, subscribe to local charities or what not in return for votes. This process was carried to a novel extreme in London in the last election, where more than one candidate not only gave a subscription to associations in his district, but actually joined them. Several cases are reported of West End Tories standing for East End constituencies, who made much of the local friendly societies and local clubs, and became members of the "Loyal Friends," the "Ancient Shepherds," the "Buffaloes," the "Druids," and so on. It is, no doubt, a great promoter of true democracy to put yourself in a position to be clapped on the back as a fellow-Ancient Shepherd by a great many constituents; and if they give you their votes as a further mark of good feeling, where is the corruption in that?

Several metropolitan districts witnessed the application of an original form of social influence in the shape of "at homes" or "drawing-rooms" given by wealthy candidates as a means of ingratiating themselves with their working-class constituents. This yields a beautiful demonstration of social equality. An account of one of these affairs says that "the workingmen soon find much to interest them in the delicate fabric of the carpet, in the antique furniture and the old china." This method of securing political support must have been too great an affront to self-respecting workingmen to bring much success, but it deserves mention among the electioneering novelties of the year. Antique furniture and old china have not been unknown in American campaigning, though we have taken the terms more literally, and meant the rough furnishing of the "cabin" to which it was once thought necessary that every "man of the people" should be able to trace back his career. The snobbishness of one case is about the same as that of the other.

However strictly the election laws may suppress bribery, there seems to be no way in which they can arrest campaign canards. An amusing collection of the illusions under which many voters cast their ballots could be made from the numerous cases reported in the English papers. These fancied political issues were sometimes the work of the freeman's own muddled head, and sometimes the natural, if not designed, effect of statements made in election addresses, speeches, and posters. Thus, one correspondent of the *Times* writes:

"I was told last week by a very intelligent hospital porter resident in Battersea, and a strong supporter of Mr. Burns, that many of the workingmen in that division were in favor of home rule simply because they thought it would lead to work being found for all Irishmen in Ireland, and would thus prevent them from overcrowding the English labor market as at present."

As an offset to this may be quoted the statement of a member of the Women's Liberal Federation:

"I have been for the past ten days with a friend speaking and working in Mid Bucks for the Gladstonian candidate, each taking different villages and meetings; and my friend was told, in the presence of another lady, by the wife of a workingman, that her husband would vote for the Unionist, as he had been told that if a home-rule bill were passed all the people in the village would have to become Roman Catholics or else be burnt with fagots on the village green. My friend came across the same belief in another and distant village, and I came upon traces of it in various places in the division, so that it had evidently been systematically set about."

To these novel phases of the home-rule question, as that question shapes itself in the intellect of the English elector, must be added another, furnished by a Gladstonian poster in East Wilts. The candidate in that constituency interpreted home rule to mean "local self-government for Ireland and for the villages of England," and was said to have got many votes from those who expected to see a village council set up on the spot. At any rate, the district gave a Liberal gain of one, though the victory may have been due in part to the other war-cry of the candidate: "If they wanted the price of bread to go back to three and four shillings a gallon, let them go and vote for the Tory party." In fact, the defeated Tory candidate attributes his overthrow to the latter cry, writing to the *Times:* "The laborers,

and especially their wives, honestly believed that if I were elected, food would go to famine-prices, and the line they took was, 'It mayn't be true, but we won't give 'em a chance.' I can safely say I have never seen so violent or revengeful a spirit as was exhibited by the wives of the laborers at the end of my contest." Such incidents illustrate the fatal as well as wholly gratuitous blundering of Lord Salisbury's protection speech at Hastings.

The workings of political argument on the peasant mind are usually a great mystery, and some of the reasoning processes of Hodge in the late election are curious enough as reported. "Yes," said a Sussex elector, "I'm against home rule, but certainly Lord H—— do manage his cows terrible well." It is obvious that, in such a case, the far-away and abstract bogey, home rule, will not count for as much as that wonderful knack with the cows, in evidence on the spot every day, and that Lord H—— will get the coveted vote. Mr. Schnadhorst is about the only Liberal prophet who came out of the campaign with any reputation left, and the accuracy of his predictions in regard to the county elections shows that he must know his peasants as well as George Eliot or Mr. Hardy himself.

THE GENERAL ELECTION IN IRELAND.

DUBLIN, July 23, 1892.

THE Irish National politician would indeed have been thought a Cassandra who, three years ago, should have predicted that the general election would come and go without an immediate triumphant settlement regarding Home Rule being assured. Like toilers up a mountain-side, we have reached what long appeared to be the summit, and yet now other heights remain to be surmounted. There is, however, no reason for discouragement. Ireland has passed more safely through the ordeal than could at all reasonably have been expected. If a satisfactory settlement within the next few years can be attained, it will be more enduring than if one had been snatched six years ago. We are working not for a passing political triumph, but for all time. Our difficulty has long been the disgrace of Western civilization. The completeness of its solution is of greater importance than the few years more or less spent in its attainment. The human mind is, however, prone to adapt itself to circumstances, and it is not always easy to judge the degrees in which the inevitable and the best affect our thoughts and judgment. The more the events and tendencies of the past ten years are considered, the more content we should be to make the best of present surroundings. Well-disposed people of all parties in the United Kingdom have been sobered. We are in the same boat and have common interests, and we have common dangers to face. The fusillading at Homestead concerns us as well as you.

The elections prove that the force of the Home Rule movement in Ireland has somewhat weakened. We had eighty-five united Nationalist representatives; we have now but eighty, nine of whom are unpledged, independent adherents only. But seeing the extent to which land reform has calmed the agrarian agitation, it may be that the present is a more remarkable evidence of national desires than were the elections of 1885 and 1886. The opposition in Ireland to Home Rule has undoubtedly strengthened. Notwithstanding the fact that a larger proportion of the present Nationalist members are Protestants, the political cleavage between Protestants and Catholics is more apparent than ever. We must, however, remember that the movement at first took the ascendency party by surprise. They have since had ample time to recruit and dress their ranks, to boycott and frighten weaker brethren into agreement. They have brought up their numbers from eighteen to twenty-three. The sun of a Home Rule viceroyalty will, without doubt, again warm many into national feeling; and there is nothing in their opposition to lead us to doubt that they would quickly make the best of an accomplished settlement and merge their interests in the interest of the country at large. Recent developments ought to assure them regarding their own strength, and the impossibility of imposing upon them legislation or disabilities of a class or sectarian character.

Ireland returns altogether 103 members. So long as our affairs are managed in the Imperial Parliament, any reduction of this number on the ground of reduction in population would be unfair. For the first forty years of the union our population would have entitled us to 150 in excess of this number; and for nearly forty years more we were entitled to a number, gradually decreasing, in excess of our 103. It is only within the past fifteen years that we have been in excess. Of the 103, 80 are, as has been said, for Home Rule, 23 against. Of the 32 counties, 25 are completely Nationalist, 2 completely Conservative; in 5 the representation is mixed. Ulster is a purely geographical expression. Neither it nor the other provinces have any legal existence. Since the abolition of the presidentships early in the seventeenth century, the provincial divisions have had no historical basis. The provincial idea has place only in the minds of persons residing in the northeast of the country. Never elsewhere in the island is a man heard to confine his thoughts or his interests to his own province. In Belfast alone is a time kept (one minute and a half fast) different from that of Dublin. Yet, remembering that the relative numbers of the representatives in Ulster was used as an argument against "Ulsteria," it is right to note that there is now in the province a majority of 19 to 14 against Home Rule, instead of 17 to 16 in its favor. Cavan, Donegal, and Monaghan are completely National; Antrim and Derry, Conservative; in Armagh, Down, Fermanagh, and Tyrone the representation is divided. Regarding the rest of Ireland, Dublin University is, as it has always been, Conservative. South County Dublin fell to the Conservatives in fair fight, and one Dublin city seat through division. The rest of Ireland went National.

The divisions of opinion in the country have perhaps never before been more fairly represented. Five of the 23 Conservatives call themselves Liberal Unionists. The name, apart from Conservative, has, however, no political significance whatever in Ireland. The chief interest centred round the struggle between Nationalists and the Parnellites, who, where the Conservatives had no men of their own up, received from them all possible support, moral and material. No stranger political combination has been perfected than that brought about in Ireland between the party pledged to oppose Home Rule in any form, and the party which declares that that proffered by the English Liberals is not wide enough. If anything could rouse honest Home-Rulers among the Parnellites to their position, it should be the avidity with which their journals are read and approved by the Conservatives, and the manner in which they themselves are being now regarded with approval as (according to a familiar Irish expression) "white-headed boys." The Nationalists went into the struggle 54, the Parnellites 31. They have emerged 71 and 9. The Parnellites are, upon their own theory that they are watch-dogs to keep the National sheep in order, well placed. Dublin, in the east, returns four; Clare and Galway, in the west, three; Roscommon, in the north, one; and Waterford, in the south, one. Of the Nationalists, 27 are men new to British Parliamentary life; none of them having been before widely known in Ireland but Mr. Davitt. Among the old members, Mr. McCarthy, Mr. Sexton, and Mr. Sullivan have lost somewhat in prestige by being relegated from Derry, Belfast, and Dublin, respectively, to county constituencies.

It is interesting to note that the Nationalist, the moderate party, more or less in alliance with the English Liberals, comprises the old "'48 men," those who as Fenians were sentenced to be hung, drawn, and quartered, and suffered long terms of imprisonment, and the gray-haired veterans of Mr. Butts's time; while of the extreme, the "hillside" party, all but two are comparatively recent recruits, and five out of the nine have enjoyed Government appointments. The small numbers polled by Conservatives where they put up candidates outside Dublin in National Ireland, proves the untruthfulness of the assumption that the country only desired freedom from the domination of the League to declare for Mr. Balfour. There is nothing to show that, except perhaps in isolated districts, the Catholic clergy exercised more than legitimate influence on the side they thought right. Had they declined to take any part in the contest, a much stronger case might have been made against them on other grounds than any which can now be made because of undue influence. Parnellism draws its strength from varied sources —an honest belief that it is the best and only policy for Ireland; anti-clerical feeling among Catholics; fealty to Mr. Parnell's memory; dislike, at least profound suspicion, regarding Mr. Gladstone and the English; the degree in which the avowal of Parnellism leaves men free to "grab" farms as against Nationalists, and the ready excuse it offers for no longer contributing to National subscriptions and National levies. Besides this, it implies a lofty standard of patriotism without the obligation of personal service, and it at once insures acceptance into favor by Conservative neighbors—by no means an unimportant consideration to tradesmen and professional men. Parnellism is strong among country doctors and solicitors, bank clerks, railway officials, and others who up to the date of Mr. Parnell's fall had kept clear of politics, or at the most taken but a half-hearted interest therein.

Grave danger is to be anticipated from the ill-concealed determination of many members of the Parnellite party to justify the contention that the attainment of Home Rule without Mr. Parnell's leadership is an impossibility. The worst may arise from the apparent ease with which we lend ourselves to factionism; our tendency rather to level down than level up; the ear we give to catch cries and biting political criticism; our fear of ridicule. An

Irish audience is easily imposed upon by a rowdy minority, and shamed out of its real feelings and better self by a glib speaker. We have an inherent dread of differing face to face from those whose good opinion we desire to conserve. The healthiest and best developments of Irish Catholicism, the entire sympathy and respect which have heretofore existed between the clergy and the people, are, it appears to many, seriously threatened. It is difficult to say to what extent this arises from the spread of modern ideas and intercourse with other countries, to what extent from the degree to which the clergy are leading more comfortable lives apart from the laity. Any one who knows Ireland well may be pardoned for not desiring to have to pass through a period in which the people of the country generally would be divorced in sympathy from the clergy of that faith which has been and is to them the highest exposition of spiritual life and hope.

The labor question, whatever it may be, both in Great Britain and in Ireland, might prove a serious complication. Disaster would assuredly follow any serious attempt to justify Mr. Davitt's assumption that the Irish party is practically a "labor" party. Our English friends upon the whole have assuredly grasped the principles upon which a sound social fabric can be built up in Ireland; they have discounted the contention that the peace which here reigns at present is due to Mr. Balfour's policy of perpetual coercion. Those who were attracted to an excited consideration of the Irish question, as something curious and novel, through the turmoil and imprisonments of the earlier years of Mr. Balfour's régime, have gradually slid back into the ranks of Conservatism.

When all is said, it must be apparent that if Ireland is true to herself, she holds the political game in her own hands. There are, however, tendencies apart from politics that make against her settled and solid growth. Travelling round the country, I asked why athletic clubs, literary associations, and music were not more thoroughly cultivated, and I was almost invariably told that the best members soon sought a wider sphere for their talents in Great Britain and the United States. Wandering out early one morning from a country town for fresh air, during the height of the election, I looked over a beautiful prospect of land and sea. "What a country this might be!" I exclaimed to a young stranger who stood beside me. "And yet, what hope is there?" he rejoined. "Of four hundred school-fellows, I can count but five at home, while during a residence of a few months on the Californian slope I met thirty-six of them." D. B.

THE DECORATIONS AT CHICAGO.

LONDON, July 14, 1892.

THE papers and magazines of late have been full of the Chicago Exhibition. The buildings have been described, the results foretold—in a word, every detail so accurately explained that one wonders what will remain to be said when this newest World's Fair opens. Then it will be time, I suppose, to begin to talk about the Paris show of 1900. Despite all that has been written, however, I have seen but little reference to the proposed mural decoration of two of the larger buildings. And yet nothing in the entire Exhibition is even now of more importance to the artist and the public alike. It is not only because one looks forward with interest to learn what men of such distinction as Mr. MacEwen and Mr. Melchers will accomplish when working on a large scale and carrying out a definite decorative scheme; but their designs will, in all probability, give the art of the painter in America that impetus in the right direction which it has so long needed.

It is true that the manner in which commissions have been intrusted to the different architects employed has established an admirable precedent. And again, it speaks well for public undertakings in the future that the advantage of securing the advice of Mr. St. Gaudens for all sculptural decorations has been recognized. The least appreciative man who has followed the illustrations in recent articles on the subject in the *Century* must admit that the Exhibition will lose nothing by the substitution of the sculptor for the old time-honored cheap stone mason. Of course, of this the artist never had a doubt. I felt the gain still more keenly when, in Paris, I saw in Mr. MacMonnies's studio the model of the great fountain, and, above all, the colossal figures of Time and Fame, upon which he was then at work, and which are almost Michael-Angelesque in their dignity and the beauty and impressiveness of their colossal proportions, and in the vigor of their modelling. Indeed, while the model could not quite satisfy me as to the ultimate effect of the fountain as a whole, of the power displayed and success attained in each individual figure there could be only one way of thinking.

However, when all is said, it is to the decoration of the interior that special interest is attached. Our absurd modern picture exhibitions show more and more with every year the demoralizing effect of the false conditions under which the modern painter labors. Painting, as well as sculpture, may be said to be dependent upon architecture; its main end is decoration, and if the artist does not know the building or the walls which he is to decorate, it is by a mere fluke that his designs, when placed in private room or public hall, fulfil this end. However good in themselves, their effect may be entirely destroyed by incongruous surroundings. The reason why thirteenth and fourteenth-century frescoes seem to-day such marvels, the reason why our so-called decorative artist (as though the very name artist did not imply the prefix decorative) despairs of rivalling them, is because the old men did not work in the dark, as it were, but knew from the beginning the interior they were to decorate and its architectural characteristics, how the light would fall upon their designs, and with what other decorations these would be expected to harmonize. Nothing has so helped to bring art in France to its present high standard (from which, however, it now threatens to fall rapidly away) as the chance given to distinguished artists to decorate important public buildings. Much of the best contributions to the two Salons are always the ceilings and panels for the Paris Hôtel de Ville, or that of some other large French town; the Panthéon has been the best of training-schools. Puvis de Chavannes, Besnard, Laurens, Chabas have all achieved their greatest triumphs in fulfilling these municipal or State commissions. With us there is the constant outcry that we have no genuine American art. Art knows no nationality; but if this means that we have no artists who have done great work *in* America, it is simply because none have been allowed to prove what they can really do. What can a man accomplish who paints for an exhibition where his picture must somehow attract attention; where, if it be without striking eccentricity of subject or treatment, likelier than not it is passed unnoticed? The painting for picture shows tells nothing, and, unfortunately, few Americans can afford to paint for any other object than to exhibit in galleries, large or small. If the artistic development of illustration has been almost phenomenal since the days of Menzel, it is chiefly because illustrators have had the great advantage of knowing where and how their drawings were to be used. Like the painters of old, they have been able to work in broad daylight. A step in advance was taken when Mr. Abbey and Mr. Sargent were invited to decorate the Boston Public Library; but I understand that the commission intrusted to them is due to private munificence. On the other hand, the decoration of the Chicago Exhibition buildings is a public undertaking, and, though the designs will be seen but temporarily, they should appeal to a far larger audience. This is why one cannot help hoping that much good will result from them.

The Chicago scheme does not err on the side of over-elaboration.* In the Palace of the Liberal Arts there is to be a decoration over each of the four doorways, two to be painted by Mr. MacEwen and two by Mr. Melchers. Of the qualifications of these artists for the task it is useless to speak. Their work is well known at home and in Paris, where they are among the most conspicuous contributors to one or the other of the Salons. Wherever they have exhibited, they have received medals, both are *hors concours* in Paris, and, if decorations count for anything, they have plenty to show. Many of their canvases have been of fairly large Salon dimensions, but as yet they have never attempted anything on the scale of the designs they are now preparing for Chicago. When I was in Paris, they had made their preparatory sketches and were just beginning to carry these out, though the final work will be done on the spot in Chicago, which is as it should be: effects of light and color can then be modified or strengthened until they are in perfect harmony with their actual surroundings. Their subjects are appropriate to a Palace of the Liberal Arts: Music, Art, Industry, and Sport; and the treatment they have decided upon is no less in keeping with the architectural design of the building. The architects have chosen classic models: Mr. MacEwen and Mr. Melchers have deserted for the time their favorite Dutch peasants' costumes and backgrounds for classical forms and composition. It is too soon to consider these critically; they must first be seen on the walls they are meant to decorate. Until then there is nothing more to be said, unless I add that Mr. MacEwen's figures will almost all be draped, while those by Mr. Melchers will be mostly nude. And really, since their talent as painters has long since been tested, it is with their power as decorators that we are now concerned; and of it no judgment can be formed until the work is completed. The future of art in the United States must be influenced, for good or for ill, by the measure of their accomplishment.

In the Woman's Building, also, the chief decorations are confined to the two doorways. Here the artists appointed are, naturally, women: Miss Cassatt and Mrs. MacMonnies. Both, like Mr. MacEwen and Mr. Melchers, live, for part of the year at least, and work, in Paris. Miss Cassatt is a woman whose reputation, though she exhibits seldom, was long

*It has been considerably enlarged since our correspondent wrote, and we understand that Messrs. Sargent, Vedder, Simmons, Weir, Kenyon Cox, Beckwith, Twachtman, Maynard, Metcalf, and others are to be given a chance to show what they can do in decorative painting.—ED. NATION.

since made. When she has exhibited, it has been in the Salon des Indépendants, a fact which at once explains her methods and sympathies. Her name, however, is far better known than her work; that this is good is certainly the opinion of such men as Manet and Degas, Pissarro and Monet, whose friend and fellow-worker she has always been. It is the modern woman glorified by Worth she intends to treat; and with her, as with Mr. MacEwen and Mr. Melchers, while one may be sure of what she will get out of her subject, one has yet to learn how well she can adapt it and her methods to large mural decoration. Mrs. MacMonnies has still her own name to make; hers is an opportunity afforded to few women of her age, but she could have no better incentive.

In the Woman's Building, therefore, as in the Palace of the Liberal Arts, interest for the artist centres. There will be, no doubt, much that is delightful in the exhibition of pictures, which promises to be second in completeness only to that of Paris in 1889. But whatever the pleasure it can give, whatever the service it can render to the student, we already know not only the uses but the abuses of the picture gallery; we have yet to learn the importance and extent of the artistic outcome in America of the new departure in the mural decoration of public buildings. N. N.

HUGO'S JOURNEYS IN FRANCE AND BELGIUM.

PARIS, July 21, 1892.

THE literary executors of Victor Hugo seem bent on publishing as many volumes as they can: nothing shall be lost, not even a line, of what the great poet left in his drawers. Would he have published all that is given to us? I doubt it; he was one of those men who do their thinking pen in hand and throw everything on paper. Many of these notes hardly deserve the honor which is now paid to them; they often make us think of the "dormitat Homerus." Few people, on the whole, will take the trouble to read the "Théâtre en liberté," "La fin de Satan," "Choses vues," "Toute la Lyre," "Les Jumeaux," "Amy Robsart." There is a volume in preparation under the title 'Ocean'; we may almost guess what its contents will be—what an accumulation of adjectives, what comparisons! Pierre Loti has made us a little fastidious by publishing his 'Pêcheur d'Islande,' and he has also tired us somewhat with descriptive literature.

I confess having opened with some diffidence a new volume called 'En voyage: France et Belgique,' though I am fond of reading books of travel. I must acknowledge, however, that I was agreeably disappointed; I found in the volume the real Victor Hugo, young, ardent for mediæval architecture, with all the fire of the Romantic school in him. The Romantic movement was a true revival; the Romanticists professed a great love of the past, of Gothic as opposed to Classic architecture. 'Notre Dame de Paris' was an apotheosis of the Gothic style. We see in this new volume how Victor Hugo studied carefully the architecture of the middle ages; his journeys in Normandy, Brittany, Flanders, had this study for their principal object.

In order to understand the importance of the Romantic movement from this special point of view of architecture, you must remember what was the state of things towards 1830. Gothic art was absolutely despised; the finest churches built during the middle ages had been dishonored in every way by whitewashing, by the addition of incongruous ornaments, having no relation whatever with the noble art which had erected the cathedrals of Chartres and so many other places. The Catholic clergy, who might have been the guardian of the treasures of this great art, were absolutely ignorant, and sacrificed everything to the vapid and gaudy style which now goes under the name of the Jesuitical style. The reaction began with the first efforts of the Romantic school. Chateaubriand, in his 'Genius of Christianity,' was one of its unconscious though most powerful instruments. Victor Hugo entered early the list of those who looked on every form of art as the legitimate offspring of a certain state of civilization. The influence of the Romantic school was strong enough to oblige the Government to appoint a Commission on Historical Monuments and provide it with funds for the restoration of these monuments. This Commission, which has a permanent existence, has done a very good work; it has saved hundreds of monuments from utter destruction; restorations have, under its guidance, been done with great skill, with a feeling of great respect for the spirit of the past. Mérimée was long one of its members, and his reports on the monuments which he visited as one of the Inspectors of the Commission are extremely interesting and have become very dear, because very few copies of them were printed at the time. You may safely say that when a church or a monument has had the good fortune to be classed as one of our historical monuments, and thus to come under the supervision of the State, it is saved for ever; for our new Republicans are no iconoclasts—they have more wisdom than their predecessors of 1793, they respect everywhere the emblems, the symbols of the past; they did not, even, after the fall of the Second Empire, obliterate the monuments which had been built under Napoleon III. Let each period leave some trace of itself behind.

This brings me to a question I have often heard discussed among architects, and you will find it discussed in Victor Hugo's notes: if you have before you a church built in the Roman style or in the Gothic style, is it proper to demolish a fine altar built in the seventeenth century or in the eighteenth century, a beautiful pulpit in the style of later ages? I, for one, do not believe so. It is essential, in a work of restoration, to have as much unity as possible in the great architectural lines, though we often see a Roman choir annexed to a Gothic nave; but, desirable as it is to respect the architectural ideas of the past, the lines which give to a monument its essential character, its physiognomy, it does not seem to me necessary to enter too much into the details which are purely ornamental. As we see in a geological section strata succeeding strata, let each century leave its mark on the fundamental groundwork of the first age of a monument. See how much variety there is in San Marco in Venice, in the church of Monreale in Sicily —a variety, truly, of details which does not preclude a powerful unity in the initial conception. Surely, if you build a new Gothic church in America, it is proper to introduce Gothic ornamentation in all its details; but why should we clear an old Gothic church of a number of beautiful ornaments and additions left by succeeding centuries, if these ornaments and additions do not disfigure the whole?

But to return to Victor Hugo. He was an ardent admirer of the relics of the middle ages, and his enthusiasm is at times quite touching. He invents admirable expressions in describing an old church. It is quite pleasant to travel with him, and his indignation against the modern iconoclasts is catching.

"I am indignant at the devastations I meet with at every step. At Alençon, a grave and fine statue of white marble, dressed like Marie de Médicis, breaks its nose on the darkest wall of the church. At Mayenne, a horrid white prison is stupidly built in the middle of the old castle. At Pontorson, on an admirable piece of an altar of the Renaissance, the curé has put the most stupid of confessionals. You walk thus on a bas-relief of the sixteenth century which represents the Pentecost. At Dol, a tomb of the Renaissance is falling to pieces. At Avranches, there remained a fine pillar of the cathedral; it has been demolished. At Coutances, the whole cathedral is a scandal. An ogive of the fourteenth century has been deformed in order to receive an absurd altar with a golden sun, which cost four thousand francs. Two great walls of plaster have been built across the transept. . . . At Saint-Lo, they allow an admirable church to fall which has two spires as fine as the great spire of Saint-Denis, etc."

This was written in 1836; we have improved since, but there are many places and things which are going to ruin, notwithstanding the efforts of the State, of the department, of the clergy—which is less ignorant of architecture than in old times—and the generosity of many patrons of art and lovers of history.

The notes on Normandy are certainly, even now, worth reading, as Normandy is extremely rich in monuments.

"I have seen," says Hugo, "all the beautiful cities of the shores of the Manche—Bayeux, which has an admirable cathedral; Caen, where I counted on my arrival fifteen spires. At every moment, in the smallest village, you find these admirable stone spires, which rise, strangely enough, from a very small church, like beautiful flowers of the field on the top of an ugly plant. In the evening we walk, Nanteuil and I, in the cities; we lose ourselves in the tortuous streets, and we have only to lift our eyes to see at every step the high steeples of cathedrals which make magnificent chimneys to miserable roofs."

The wonderful descriptive powers of Victor Hugo are shown in these notes, almost at every page. His descriptions of the sea, for instance, are among the finest pages he ever wrote; but how can you translate such descriptions into another language? In a letter from Tréport (a little town near Eu) to his friend Louis Boulanger, the painter, he says:

"I went towards evening to the seashore. The moon was rising, the tide was rising; the fishing-boats came bobbing out one after another from the narrow passage of Tréport. A great brown mist covered the sea horizon, into which the sails entered, simplifying themselves. At my feet the ocean advanced step by step. The waves came and covered each other like the slates of a roof in building. The wind was high, the whole horizon was covered with green and trembling spots; over all this an awful noise, a sombre aspect, and the great muslin of the foam which tore itself on the rocks. It was fine and monstrous. The sea was in despair; the moon was sinister. How strange to see this immense, mysterious chimæra, with its thousands of scales, lifting itself painfully towards the pale, cadaverous face which attracts it from a distance of 90,000 leagues, as the serpent attracts the bird! What is this fascination in which the ocean plays the part of the bird?"

Hugo excels in the description of something awful and mysterious; he delights in it. He is the poet of the night.

"I have always liked to travel during the twilight hours. It is the moment when nature deforms itself and becomes fantastic. The houses have luminous eyes; the elms have sinister profiles, they throw themselves backwards as if they laughed; the plain is nothing but a dark line which the crescent of the moon pierces with its horn and slowly disap-

pears; the heaps of corn along the roads look like phantoms conversing in a low voice. At times you meet a shepherd standing, who gazes at you with a strange look. Your carriage moans feebly and complains of fatigue; the iron pieces, the wheels, give each their little note, high or low. You hear from time to time in the distance the noise of bells; it increases, then diminishes, and is no longer heard. It is some other carriage which is on a distant road. Whither is it going? Whence does it come? By the light of the constellations, which make a hundred magnificent figures in the sky, you see around you sleeping faces; it seems as if the carriage were full of dreams."

It is odd to read such things in letters; they are the outpourings of a poetic mind. You find in every line the poet who personifies nature and who lives "dans son rêve étoilé."

Correspondence.

THE CONJUNCTION *LIKE*.

To the Editor of The Nation:

Sir: According to the late Professor W. B. Hodgson, in his *Errors in the Use of English* (1881), "the adverb *like* is often improperly, because needlessly, employed for *like as* or simply *as*"; and, for the employment of it thus characterized, he quotes, with others, Mr. Henry Mayhew and Professor Bonamy Price, besides Charles Dickens's "Nobody will miss her *like* I shall."

Mr. Brander Matthews, in *Harper's New Monthly Magazine*, vol. lxxxiii., p. 218 (1891), remarks, with implied reprehension, that, in England, *like* for *as* "is heard in the conversation of literary men of high standing, and now and again it even gets itself into print in books of good repute," citing, for it, Mr. J. Cotter Morison and Mr. Walter Bagehot.

In the opinion of Col. T. W. Higginson, as expressed in *The New World and the New Book*, p. 201 (1892), "it is hard for criticism to deal seriously with a novelist who writes: . . . 'He . . . read on *like* some one reads in some ghastly dream';" words occurring in the pages of Mr. Rider Haggard.

Other strictures, of which many are producible, corresponding to these in tenor, are here omitted, as being superfluous.

The inference to be deduced from the premises before us is, that such locutions as those instanced above are by no means generally known to be other than modernisms.

King Alfred, in his translation of Orosius, writes, together with *gelice and spinge déd*, "as a sponge doth," *gelice and seó waére*, "as if she were." Answering to *as*, in "*as* you know," and in Milton's "*as* earth and sky would mingle," is *gelice and*, with its twofold import. The phrase is, indeed, conjunctional; but, that its element *gelice*—whence, perhaps, by aphesis, our adverb *like*—was ever a conjunction, has not, to my knowledge, been established. The attempt which has been made to father on Anglo-Saxon the equivalent of "*like* a sponge doth" falls, therefore, to the ground.

Directly, for *directly when*, promises to become, eventually, quite legitimate. Other conjunctions, more or less used, which, similarly, have come up in recent times, are *immediately*, *instantly*, and *once*. But the specific illustration of ellipsis which they offer was anticipated, in the occasional substitution of *like* for *like as* and *likewise as*, ages ago.

What it was that prompted this elliptical substitution is not apparent. Was it something disagreeable in the quaintness of the longer forms? Or was it the ambiguousness of *as*, which so often is causal, one with "since"? Specious as these surmises may be, neither of them, I apprehend, will endure historical examination.

Exemplifying the use under consideration are found, before 1800:

"I sawe hym never wyth myne eye, That could werke *lyke* I." Anon., *The Smyth and his Dawe* (15th century), in Mr. W. C. Hazlitt's *Remains of the Early Popular Poetry of England*, vol. iii., p. 203 (1866).

"And then the king of Castile desired him that he would licence him to do his duty *like* a knight and brother of the order ought to do to the Sovereign." Anon. (1506), in *Memorials of King Henry the Seventh* (1858), p. 296.

"And, *lyke* an excellent Phisition cureth most dangerous diseases and deadly wounds, so doth a man that is valyant advance him selfe as invincible in things that doe seeme most terrible," etc. Sir Thomas Elyot, *The Governour* (1531), fol. 163 (ed. 1580).

"Ye have said *lyke* a noble lady ought to say." Lord Berners, *The Hystory of Arthur of Lytle Brytayne* (about 1530), p. 520 (ed. 1814).

"Then was this popish mass in great controversy, *like* it is now." Bp. John Bale (1546), in *Select Works*, etc. (1849), p. 171.

"Did not David thirst after thee, *like* the thirstie hart the fountaines of cleare water . . . ?" Rev. Dr. Thomas Wright, *The Passions of the Minde in Generall* (1601), p. 194 (ed. 1620).

"*Like* noble babe . . . cannot conject His own true parentage, . . . So we . . . can not divine," etc. Rev. Dr. Henry More, *The Præexistency of the Soul*, st. 5, 6, in *Philosophicall Poems* (1647), p. 256.

"*Like* one . . . eats his fill Before his painful march, So would I feast awhile my famish'd eyes," etc. Dryden, *All for Love* (1668), Act iv.

"I believe that this Impression of the Wounds was only perform'd in the strong Imagination of S. Francis, much *like* some others have imagin'd that they had Feet of Wax and a Head of Glass." Gabriel d'Emilianne, *The Frauds of Romish Monks and Priests* (1691), p. 134 (3d ed.).

"To act *like* Judith did with Holofernes." Rev. Myles Davies, *Athenæ Britannicæ*, vol. i., p. 253 (1715).

"The officer, *like* Sir Piers Exton . . . served king Richard the second, jumping upon a chair, struck such a blow that it brought the unfortunate gentleman to the floor." William Toldervy, *The History of Two Orphans* (1756), vol. iv., p. 183.

"She flies to the dear retreats of Twickenham, *like* a fond daughter to the indulgent arms of a consoling parent." Anon., *The Generous Attachment* (1787), vol. iii., p. 136.

"He talks *like* Brunswick did, and may, perhaps, act in the same manner." Robert Southey (1792). *Selections from the Letters*, etc. (1856), vol. i., p. 12.

To come to this century, so frequent, at least in lighter literature, is *like* for *as*, that, after what has been shown in the opening paragraphs of this letter, even the few quotations which here follow may be thought more than sufficient:

"It is common to hear the conduct of French officers, in breaking their parole, not only mentioned without censure, but praised and applauded,—*like* a successful theft might have been in Sparta,—as a justifiable and meritorious act of dexterity." Henry Matthews, *The Diary of an Invalid* (1820), p. 474.

"Stalls, *like* in cathedrals." Cardinal Newman (1833), in *Letters*, etc. (1891), vol. i., p. 324.

"They are strange and startling, *like* the products of a dream ofttimes are, to the mind which has actually produced them." Dr. Henry Maudsley, *The Physiology and Pathology of the Mind* (1867), p. 18.

"That is just *like* it is at my house." Sir George W. Dasent, *Tales from the Fjeld* (1874), p. 235.

Most of the foregoing illustrations, besides others, I had long had by me when I discovered that two of them, belonging to the years 1647 and 1668, had been already adduced for the same purpose for which they are here exhibited. I refer to Article lxxiii., entitled "*Like* in the sense of *as*," in Mr. William Sidney Walker's *Critical Examination of the Text of Shakespeare*, etc. (1860), vol. ii., pp. 115–123. Of the illustrations common to Mr. Walker and myself, while I have retained those from Dr. Henry More and Dryden, I have, for brevity, omitted those supplied by Sir Philip Sidney, Shakespeare, Middleton and Massinger, and a few more.

Supplementing Mr. Walker, his editor, Mr. W. N. Lettsom, observes that "the old idiom seems to have become obsolete by 1664"; and the observation is of a kind which, in my experience, is far from unusual. For instance, I once chanced to mention to a learned friend, as a curious circumstance, that *abandonment*, though it was proposed in the days of Queen Elizabeth, was as good as in a trance—notwithstanding Lord Shaftesbury's venture to resuscitate it—for nearly two hundred years; and I was not at all surprised at my interlocutor's protesting, in reply, that the word was quite novel to him. Of course he was mistaken. And who can doubt that Mr. Lettsom had heard "the old idiom" all his life?

As has been seen, the Anglo-Saxon *gelice and* bears the two senses "as" and "as if," and *like*, the conjunction, therein tallies with it. In having the sense of "as if," *like* is, however, no home-born Americanism, as Mr. J. R. Bartlett takes it to be. Quotations in disproof of this view of his are subjoined:

"The paleys trembled *like* to have gone all to peces." Lord Berners, *The Hystory of Arthur of Lytle Brytayne* (about 1530), p. 143 (ed. 1814).

"He was bygge and hye above all other, and coloured *like* the rede rose had ben set on the whyte lyly." *Id.*, *ibid.*, p. 338.

"In place of whom, as it befel my lot, *Like* on a stage, so stept I in strayt waye." Thomas Sackville, Earl of Dorset, *The complaynt of Henrye duke of Buckingham* (about 1559), st. 7, in William Baldwin's *A Myrrovr for Magistrates* (ed. 1563), sig s 1 v.

"*Like* in sickness, did I loathe this food." Shakespeare, *A Midsummer Night's Dream* (about 1595), Act IV., scene I.

"They that from youth doe sucke at Fortunes brest, And nurse their empty hearts with seeking higher, *Like* Dropsie-fedde, their thirst doth neuer rest." Fulke Greville, Lord Brooke, *Mustapha* (1609), Act II., Scene III., in *Works*, etc. (1633), p. 105.

"I felt my face *like* on fire." Mrs. A. M. Bennett, *The Beggar Girl and her Benefactors* (1797), vol. ii., p. 194 (ed. 1813).

The Rev. Prof. John Earle writes, both in the first edition of his *Philology of the English Tongue* (1871), and in the fifth edition of that popular work, issued this year: "In the sentence, 'he behaved *like* a scoundrel,' *like* is a preposition. But, if we say it in provincial English, thus, 'he behaved *like* a scoundrel would,' *like* is a conjunction." To the designation "provincial English," unmodified, I am obliged to demur.

Dr. Schele De Vere, in his *Americanisms* (1872), deviates so far from correctness as to say that "*like* instead of *as* . . . is almost exclusively an Americanism, being but rarely heard in England"; an excellent sample of intuitive philologizing.

It remains to state the conclusion to which one is led, by inquiry, touching the conjunction *like*. Its antiquity, then, proves to be very considerable; few good writers have ever lent it their sanction; at one stage of its history, it was confined mostly to poetry; and its repute, as literary or formal English, is now but indifferent. Yet, as a colloquialism, it is, in our day, here in England, widely current, in all ranks of society, from the highest to the low-

est. This being the case, if a British novelist, or dramatist, dealing with contemporary life, studies to avoid it altogether, in the familiar conversation of his characters, though meant to be ever so highly educated, he may fairly be said to do a certain degree of violence to the truth of things as they are. Against no one, therefore, can the charge be brought, otherwise than arbitrarily, of committing an absolute and indefensible solecism, if he chooses, in his talk, to say, for instance, "I think *like* you do." Personal dislike may dictate an adverse judgment on the phrase; but its due, in the eyes of any critic adequately equipped with facts, is toleration. F. H.

MARLESFORD, ENGLAND, July 16, 1892.

P. S. In the couplet cited above from *The Smith and the Dave*, "lyke I," it may be objected, would not have been used but for "eye" in the first verse.

Again, in the passage cited under the date of 1691, quite possibly there is a rather violent ellipsis of "who" after "others."

The expressions *like as if* and *like as though*, with "I have not anything *like* got through the work," "I felt *like* laughing," etc., are here purposely left undiscussed. The vulgar *like as if* precisely represents the compound conjunction in the second passage which I have quoted from King Alfred.

Notes.

B. WESTERMANN & Co. will have ready in September the third volume of Conway and Crouse's translation of Karl Brugmann's 'Comparative Grammar of the Indo-Germanic Languages.' The fourth and concluding volume, with a full index, will be issued next year.

Ginn & Co. announce for publication in the fall 'Analytics of English Prose and Poetry,' by Prof. L. A. Sherman of the University of Nebraska.

An elementary text-book, and a higher 'Treatise,' on Plane and Spherical Trigonometry, by Prof. Edward A. Bowser of Rutgers College, are in the press of D. C. Heath & Co.

Harper & Bros. announce 'The Desire of Beauty,' an essay in æsthetics, by Theodore Child, and 'A Family Canoe Trip,' by Florence Walters Snedeker, with illustrations.

At a recent meeting of the Berlin Geographical Society, the Chairman, Baron von Richthofen, announced that the society was about to publish, in commemoration of the 400th anniversary of the discovery of America, a work descriptive of the ancient manuscripts and maps in the Italian libraries relating to the history of this event. The German Emperor has promised a contribution of 15,000 marks towards the expense of the undertaking, and it is to be edited by Dr. Kretschmer. The accompanying atlas will contain thirty-five large maps, of which thirty-one are new, and will be published for the first time.

Whether there was any call for a third Life of J. G. Whittier while he is still among us, may be questioned; but few will think it fortunate that Mr. William Sloane Kennedy has for the second time written a biography of the "Poet of Freedom." It forms the latest volume in the series of "American Reformers," published by Funk & Wagnalls Co. After comparing it with the same writer's previous attempt (1882) and with Underwood's (1884), we think him rash in challenging on his title-page the Talmudic ordeal: "He that knows anything worth communicating and does not communicate it, let him be hanged by the neck." There is one really interesting discovery of an anticipation by Whittier of a famous passage in Wendell Phillips's Lovejoy speech in Faneuil Hall, even to the phrase "those pictured lips." On the other hand, the unestablished if probable kinship between Whittier and Daniel Webster is reaffirmed without any attempt at genealogical tabulation, and Caleb Cushing and William Pitt Fessenden are now gayly added to the family circle. There have been genuine groups as remarkable as this in New England descent, but the proof of so much allied greatness would have been worth all the rest of Mr. Kennedy's discursive and slipshod performance. His note on p. 71 about the shaving of Burleigh assigns to Boston a scene from the Rynders mob in New York in 1850, and makes William A. instead of Charles C. Burleigh the hero.

G. P. Putnam's Sons are the New York publishers of Sir W. G. Simpson's handsome volume on the 'Art of Golf.' When we expressed the hope that this excellent game might soon become acclimated here, we hardly looked for so complete a fulfilment of our desire as a year has brought about. At this moment the game is being zealously cultivated at Tuxedo, at Tarrytown, at Cedarhurst, and among the sand-hills of Shinnecock, where it has captured not a little of the overflowing enthusiasm of the new artistic colony. Such an introduction augurs well for the final acceptance of the game, for one of its peculiarities is that every tyro becomes an evangelist by virtue of an afternoon's play, and much may be expected of an infant industry which is smiled on at its birth by fashion, sport, and art. The present volume adds little to the accumulated wisdom of the Badminton book on golf, but it is written in a pleasing style, not devoid of humor, and the make-up is attractive. The illustrations, also, are admirable, and can scarcely fail to be of practical use to the many young men and maidens who are spending these warm afternoons in "sclaffing" turf and breaking clubs.

'A Scamper through Spain and Tangier' (London: Hutchinson & Co.), by Margaret Thomas, is a pleasant record of a traveller's experience, by a lady already favorably known as a poet and sculptor. Its principal value, perhaps, lies in the fact that it shows that two ladies, without escort, can visit the chief Spanish cities cheaply and in perfect safety, though they must be willing to put up with rough fare and considerable discomfort. Art is, of course, the engrossing topic, but there are many bright descriptions of street scenes and of urban life generally in Spain, as it appears to the passing traveller. The impression of the people left on Miss Thomas was not an encouraging one. They seemed to her "ignorant, passionate, and partly savage—above all, indomitably idle, but warm-hearted, affectionate, and disinterested to the last degree, especially the women." The chapters on Tangier are less interesting than the others, yet include a graphic account of snake-charming as well as of the principal performer, who in private life proved both intelligent and not unattractive. The author sounds a note of alarm to all who prefer un-Christian lands without the veneer of modern civilization, in the announcement that "parts of Tangier are lighted with electric light, and it is proposed to make an electric tramway from the Soko to the sea." The book is attractively illustrated from the writer's own sketches, but its literary value suffers from the fact that she has used her notebook so literally that too much of what she writes is, what she herself frankly confesses it to be, "bald, disjointed chat." The whole cost of her trip, which embraced the most interesting cities of Spain, and apparently extended over several months, was only fifty pounds.

Mme. de Sévigné naturally occupies the largest space—quite a fifth—in M. F. Lhomme's selections from the writings of Frenchwomen of the sixteenth, seventeenth, and eighteenth centuries ('Les Femmes Écrivains: Oeuvres Choisies.' Paris: Librairie de *l'Art;* New York: Macmillan). A still larger proportion of the matter has necessarily the epistolary form, and the book can best be characterized as samples of the art of letter-writing for the period just named. The selection has been managed with an eye to personal and historical information, and the editor, besides a brief sketch of each writer, appends notes and remarks. More than this, he has drawn from a rich source a great number of contemporary engraved portraits and reproduced them in facsimile; and these add very much to the value and attractiveness of a volume which is typographically very open and handsome. The work forms the fourth in a series called the "Literary Family Library," and is to be followed by a volume devoted exclusively to the female writers of the present century, who will certainly endure comparison with their predecessors.

M. Brunetière has published in book form the remarkable lectures he delivered last winter at the Odéon ('Les Époques du Théâtre français [1636-1850]'), and the volume is one which no student of the history of the drama in France can afford to ignore. He has not attempted to trace the drama back to its origins and to exhibit its various transformations in the earlier centuries, but, starting with the masterpiece of the "Cid," he has selected such plays as, in his judgment, mark a change in the principles or the form of tragedy or comedy. In stating his views, the grounds for his belief, M. Brunetière has added to the thoroughness of knowledge and the distinctly high standard of criticism which have always distinguished him, a brightness of expression, a vivacity of exposition, to which he had not accustomed us. Several of these chapters are brilliant; those on the "Cid," on "Tartufe," on "Phèdre," on "Le Mariage de Figaro" may be cited as examples. Novel points of view abound, suggestion is rife, thought springs from thought; and while one may not always agree with M. Brunetière, it must be conceded that his book is invaluable in enabling the reader to follow intelligently and to grasp easily the growth and evolution of the splendid drama of France.

M. Jules Lemaitre continues to collect into volumes his dramatic criticisms from the *Débats*, and the sixth volume of his "Impressions de Théâtre" has just appeared (Paris: Lecène & Oudin; New York: F. W. Christern). Especially interesting in this collection are the essays on Ibsen, on the "Alcestis," on Rousseau's attack on the theatre, and on Molière's "Fourberies"—indeed, M. Lemaitre is never more interesting or more suggestive than when he treats of Molière.

In a small brochure, 'Il Marito e i figliuoli di Beatrice Portinari,' Prof. Luigi Randi supplies documentary evidence to prove that Simone di Giuliano Bardi was husband of Dante's Beatrice, and had at least four sons by her. The author is librarian of the Marquis Carlo Ginori, whose collection has served him in his researches, particularly certain manuscript "Libri mercantili de' Bardi." Other private libraries of Florence have also been available to Prof. Randi.

Eight new parts of the annual supplement to

Meyer's Konversations-Lexikon (B. Westermann & Co.) take us into the letter R. On the biographical side, the number of Japanese statesmen whose names are introduced is to be remarked. American notices include, of the dead, Gordon L. Ford, Hannibal Hamlin, and J. E. Hilgard; of the living, Joseph Jastrow, Wade Hampton, and David B. Hill, who, we are told, "passes for a vulgar stamp of political trickster and spoilsman." Sir William Johnson has an article, apropos of Griffis's recent Life of that worthy. Readers of the novels of Sophie Kovalevski will find her here set down as a mathematician, first of all. The death of Farina of Cologne is recorded. The French census of 1891 is given, with its showing of a gain of population in five years of only 125,000, against 550,000 from 1881 to 1886. There has been a loss in fifty-five departments. The reviews of French and English literature for 1891, of ethnographical literature for 1886-1891, of historical literature for 1890-1891, of German art exhibitions in 1891, may be mentioned along with the summaries of proceedings at the several Congresses, Prison, Geographical (1889-91), Meteorological, Hygienic, Oriental, etc. Rich in tabulated statistics are the articles on fixed stars having a proper motion, on fire and life insurance, grain production and trade, colonies, names of regiments in Germany and Austria, illegitimacy, earthquakes (with maps for Italy), life-saving stations in Germany, missions (with a colored map), etc.

Part V. of the 'Atlas to accompany the Official Records of the Union and Confederate Armies,' now in course of publication by the War Department, consists of a large number of maps prepared by both the opposing armies, and chiefly in the Virginia campaign of 1862. But there are also sketches of operations in the Gulf States, and a general exhibition of the campaigns of the Army of the Cumberland throughout the war, in connection with the inquiry concerning Major-Gen. Buell. All these memoranda possess a value which is discernible at a glance.

In our recent notice of the interesting paper on Carlyle in the *Bookman* for July, we said that it closed "with a hitherto unnoticed memorial of his intimacy with Emerson in the shape of an article on 'Indian Meal' published in *Fraser's Magazine* for May, 1849, and signed C." We were wrong in speaking of this article as hitherto unnoticed. In a letter to Emerson, April 19, 1849 ('Correspondence of Carlyle and Emerson,' ii., 176), Carlyle says: "I on my side have already drawn up a fit proclamation of the excellences of this invaluable corn, and admonitions as to the benighted state of English eaters in regard to it;—to appear in *Fraser's Magazine*, or I know not where, very soon." There is much in the 'Correspondence' relating to "this small contribution towards World-History," as Carlyle terms the proceedings in respect to Indian corn of Emerson and himself.

Concerning the recent letter of Annie Russell Wall regarding Raphael's "Hours," a correspondent writes: "A photograph numbered 5,377 in Sommer's catalogue is said by Miss Wall to be 'absolutely the same as the "Hour" named the "Sixth Hour of the Day."' It is so indeed, and no wonder, for it was taken from some engraving or painting of that Sixth Hour. It is a misnomer when called a Bacchante and Vanità. Nor can it have been derived from a Pompeian fresco. The resemblance to the modern 'Hour' is too close for that. It is identical not only in all points of the body of the picture but in the predella, where a squirrel wagoner is driving a parrot. Neither Raphael nor any of his scholars would have stooped to such a slavish mimicry. One point of internal evidence has often struck me, namely, the resemblances of the third 'Hour of the Day' in position of arms, legs, and whole attitude to the 'Galatea' in the Farnesina, which is beyond question Raphael's own work."

It is a sign of the times that coeducation is making headway at the South as well as at the North. The University of Virginia, in very guarded fashion, offers to register women at least eighteen years old for the pursuit of academic studies, without, however, the privilege of attending "the regular lectures or other exercises of any school," though they may use the library and scientific collections of the University. They will be examined upon the same paper and at the same time with their respective classes, "under such conditions of supervision and chaperonage as the Faculty may designate," and will receive a certificate of passing. Mrs. Mary Stuart Smith, Mrs. Mary Sheffey Peters, and Mrs. E. Rosalie Thornton are a resident committee to advise and assist candidates for registration.

On page 412 of our last volume (issue of June 2), the following extract from Plautus was, by mistake, printed without the italicised words: "Neque quidquam meliust mihi, *ut opinor, quam ex me* ut unam faciam literam longam, meum laqueo collum quando obstrinxero."

—The August *Atlantic* takes notice of the Shelley centenary in a poem by Mr. Stedman, entitled "Ariel," in which he dexterously echoes some marked tones of Shelley's music and feeling in order to describe the poet, and at the same time blends a personal element with the whole—all in admirable keeping. The second paper upon "Prometheus Unbound," which must also be associated with the centenary, is less striking than its predecessor, and illustrates further the issue of the critical canon of the Browningites applied to great poetry. The analysis of Shelley's "myth," while it cannot miss the essential large lines of his thought, is illusory in detail—how illusory is sufficiently indicated by the remark, relating to *Demogorgon*, that "he has been compared to the Hegelian Absolute, and any one who enjoys the suggestion may get what he can out of it." The writer does not go to this extreme, but stops with the assertion that "the most useful way to think of him is as the Principle of Reason, . . . lying deep in the unconscious life of humanity, . . . passionless and passive." The "most useful way to think of him" seems to us rather to be Shelley's way, who saw nothing there, with all his imagination, but "a tremendous gloom." The effort to resolve poetry into a system of thought could not easily find less promising material than Shelley, and one proof of its incompetency is that it breaks down in the Fourth Act, which is described as "sentimental and empty," both "the thought and the poetry" being "equally flat." This is because the Act is pure poetry and not Hegelianism at all. The truth is, that the critical canon of the Browningites is inferred from Browning's work, and can no more be applied to the whole of poetry as a measure than a yardstick to the rainbow. We make these remarks without any prejudice to this particular article, which is an example of an unfruitful method of criticism, but is serious and thoughtful and in certain ways helpful to the student. Mr. Stillman writes of the "Revival of Art" in a well-considered paper, with less freshness than clearness of view. He concludes, after a statement of his well-known opinion in respect to methods of instruction and work and to artistic aims, that the world does not want art any longer. Mr. G. F. Watts adds an interesting but too brief comment, in which he agrees with Mr. Stillman's "general tenor," and then proceeds to make a few reservations in detail. A sketch of Townsend Harris, the first American Minister to Japan, by W. E. Griffis, well deserves more than a mention; but we must leave our readers to find it out for themselves.

—*Harper's* begins a review of the literary groups of Paris, from the pen of Theodore Child, well illustrated, in which the genealogical relations of the Naturalists, Romanticists, Symbolists, Décadents, Parnassiens, Psychologists, Impressionists, Fenanists, etc., etc., are made out as clearly as if they were mapped, and the result on the reader is to make him believe that literary men in Paris are a swarm of ephemeræ, with great powers of self-multiplying in a brief span of existence. It seems less the germination of life than of decomposition; but Paris has the best advertised literature in the world, and confers a renown like that of a writer for syndicates here, only glorified and Barnumized. An historical contribution of an exceptional sort is made by the Rev. John F. Hurst, in the "Salzburger Exiles in Georgia," in which a chapter of the settlement of the colonies is retold, and we are again reminded of how many strains are blended in the native American that now is. The Italian Army is elaborately described, Corfu and the Ionian Sea are picturesquely set forth, and Ice and Ice-making are made the subject of a partly scientific, partly practical article.

—The midsummer *Century* has the whole choir of poets in song, and fairly represents what poetry among us is capable of at the present moment. Mr. Aldrich's filed lines, with the touch of nature and sentiment, show his even power, while Mr. Stedman, with a different technique, writes smoothly also on an equally characteristic theme, and Mr. Gilder writes the true lyric. Their number makes the rest obscure, but they exercise "the accomplishment of verse" inoffensively and in very good form. The prose is largely fiction and travel. Prof. Todd's "Ascent of Fuji the Peerless," which opens the number, is on all accounts of most interest. He and his wife, who joins with him in the authorship, were of the party which made the journey to examine the summit with a view to its fitness as the station of the Boyden Astronomical Observatory, which, by the terms of the trust, must be on the top of a mountain. The journey through the lowland, with its Japanese traits, is narrated with much feeling for the landscape, and when the story comes to the time of the ascent, this power of natural description is especially marked. The summit is a point of pilgrimage for the natives, and their neighborhood on the mountain-side in the mist or in the open adds an element of human interest seldom met with in accounts of mountain ascents. On the top the necessary experiments were made to test the fitness of the site for observation, and with complete success; but the scenery of the crater and the world around, the impression of homeless nature made on the mind, and such phases of nature-poetry seem to have been the main things brought away from their experience by the travellers. The Plains of Canada, the Columbian Exposition, and Castelar's description of the voyage of Columbus and his landing, and the game of Golf are the subjects of the most important remain-

ing papers. The portrait of Shelley, rendered through the medium of a chalk drawing after the original, is a more satisfactory reproduction than we have yet had of a face that seems to baffle the engraver. Though the frontispiece of the number, it accompanies a paper on "Shelley's Work," in which Prof. Woodberry judges the poet's difference with his age. Another contribution of curious interest in connection with the Shelley centenary is Mr. John Malone's "Search for Shelley's American Ancestor."

—*Scribner's* publishes its "fiction number," as usual, this month, but the contents include a paper by Prof. Shaler, on Icebergs, well illustrated, a plea for "Children's Rights," which are by no means a matter of fiction, and a half-historical, half-descriptive account of a London parish by the river, by Walter Besant. This is one of the series upon the Poor of the Great Cities, and shows a remarkable amount of actual work done by the Church in behalf of the lowest classes. In the present instance everything conceivable seems to be done and the whole well organized. The parish is not particularly known, nor is it a place for "fashionable" slumming. The cost is £810, of which £500 is raised by subscription. The effect of all this labor, of which the greatest part is of course personal, is, says Mr. Besant, to reconcile the poor to the Church: "Those who live in the dens and witness these things done daily must be stocks and stones if they were not moved by them. They are not stocks and stones; they are actually, though slowly, moved by them; the old hatred of the Church —you may find it expressed in the workingman's papers of fifty years ago—is dying out rapidly in our great towns; the brawling is better; even the drinking is diminishing. And there is another—perhaps an unexpected—result. Not only are the poor turning to the Church which befriends them, the Church which they used to deride, but the clergy are turning to the poor; there are many for whom the condition of the people is above all other earthly considerations. If that great conflict —long predicted—of capital and labor ever takes place, it is safe to prophesy that the Church will not desert the poor." On the literary side Mrs. James T. Fields's translation of Guérin's 'Centaur' deserves notice.

—Two parties, neither of which appears to have much love for the other, have been for a long while pressing forward the cultus of Joan of Arc in France. Twenty-five years ago Louis Veuillot taunted his contemporaries (in 'Les Odeurs de Paris') with their unworthiness to set up a statue to La Pucelle, and told them that some day repentant France would beg her canonization of the Holy Father, when her statue would be seen elsewhere than on the street that leads to the new Opera-house. This year a quite new proposal came from the other side—the side that looks upon Joan chiefly as a patriot. M. Joseph Fabre, noticing that the chief events in her history fell within the month of May, came out in the *Temps* with the suggestion that the whole month should be devoted to her, regardless of the fact that to pious Roman Catholics May is already the month of Mary. M. Fabre published daily in the *Temps*, throughout the month, the acts of Joan upon the corresponding day, including her examinations and execution. This was interesting reading, but, so far as we have seen, the proposed hallowing of the month met with no response. The latest demonstration comes from the ecclesiastical side, and is of a sort that Veuillot did not foresee, and which, probably, he would not have much liked. On the first of July a statue of the Pucelle was set up at Rouen, on the slope of Bonsecours, under circumstances which made the ceremony not only a solemn rehabilitation of Joan, but also in some sort an act of reparation and penance on the part of those who now occupy the places of the ecclesiastics who had her burned. More than twenty prelates, cardinals, archbishops, and bishops assisted at the ceremony. The Archbishop of Reims, Cardinal Langénieux, blessed the monument, which is the work of the sculptor Barrias. Jehanne la Pucelle is represented standing, with bared head and fettered hands, and hair cut close, just as she stood at the stake to be burned as a sorceress and a heretic. On either side are figures of saints, representing the Voices of Domrémy.

—The following table is interesting as showing the amount of money expended for the purchase and received for the sale of works of art by the nations represented at the Munich art exhibitions of 1889, 1890, and 1891:

	Bought.	Sold.
	Marks.	Marks.
America	376,620	16,840
Germany, without Munich.	397,720	145,975
Munich	372,181	614,547
Austria and Hungary	95,040	40,370
Russia	58,975	11,500
Switzerland	25,698	1,048
England	85,890	71,177
Denmark	.....	6,650
Sweden and Norway	5,500	19,000
Belgium	4,250	49,684
France	10,250	97,236
Spain	2,000	97,730
Holland	24,700	123,074
Italy	13,720	192,843

Among countries foreign to Germany, America (*i. e.*, the United States) holds, according to this report, the foremost rank as a purchaser of works of art; and the lively appreciation of this fact is inducing Germany, and especially Munich, to make every effort to be well represented in this department at the Chicago Exhibition. There is no doubt that the reputation of Munich in this respect has suffered from the vast number of hasty sketches, mere pot-boilers of needy artists, sold by dealers to tourists as specimens of what they are pleased to call the Munich school of art.

TWO BOOKS BY MR. MAHAFFY.

The Greek World under Roman Sway. From Polybius to Plutarch. By J. P. Mahaffy. Macmillan & Co.

Problems in Greek History. By J. P. Mahaffy. Macmillan.

THE threads of Hellenic weaving which entered into the vast fabric of the Roman world are so varied and so miscellaneous that it is impossible to extract from them a pattern of much unity or consistency. Mr. Mahaffy has done his best; but the reader must content himself with episodes and excursions instead of connected and developed history. The Roman Republic was a hard master compared with the Roman Empire. The Republic had just won an unexampled dominion which it had neither the experience, the precedents, nor the temper to administer. The consequence was a series of desperate revolts in every quarter against the tyranny of its iron hand. The spirit of this tyranny Prof. Mahaffy illustrates in a striking paragraph, which we can well understand even if we do not fully accept the parallel:

"But still there was something hard, relentless, and cruel in Roman ways, which must always have filled Greek servants and subjects with horror and dismay. Not only what was done, but the way in which it was done, was harsh and cold; and so I imagine the Romans to have held the place in European disfavor which the middle-class Englishman now holds, who knows no foreign tongue, respects no foreign habit, recognizes no foreign virtue, but walks through the world assuming the English respectability, just as the Roman assumed his *gravitas*, to be the stamp of a superior race."

Yet, in spite of this hardness and coldness, the Greeks, who veered this way and that, and were ready to join other insurrections as they had joined Mithridates, had more to expect from the Romans than from any other masters; they were treated with comparative leniency by Sulla, by Lucullus and Pompey; and the idea was fixed among the Romans that the Greeks were one thing and all the rest of the East another—that the Greeks had the monopoly of culture, and that the "rest of mankind were only fit to serve them and the Romans."

But this Roman feeling for Hellenic culture and manners varied greatly at different epochs. It might be traced by a fluctuating curve which rises high at the time of Flaminius, which sinks in the period of Cato and Cicero, which finally, under Claudius, begins the long ascent that culminates in the Byzantine Empire. The most original and the most curious of Prof. Mahaffy's studies is the chapter which describes the Hellenism of Cicero. Cicero knew the Greeks thoroughly, he knew their literature, their philosophy, even their art, more than he professes or than Mr. Mahaffy will have us believe. He had lived among the Greeks, studied among them, made acquaintances whom he calls friends among them; he praises them, he pays them compliments; he allows them some virtues, many graces, and supreme culture; he accepts and returns their civilities, but he will not make intimates of them—he will not trust them, he warns his friends not to trust them. He uses the same proverb as to their honesty which one hears to this day circulating in Italy and the Levant. Before a jury, he is their patron and their apologist; when he is rehearsing the plunders of Verres, he disclaims all critical knowledge of their art, as a dignified advocate would nowadays disclaim a knowledge of the mysteries of millinery. In this disclaimer it is likely that he was posing to some extent, was yielding to a fashion and was calculating his effect upon his listeners. For if he does not understand Greek art, and if even in Athens he has little to say of the beauty of the city, yet he certainly does understand the Greek feeling for art and the Greek estimate of art treasures.

The Romans, indeed, were by degrees acquiring some sense of the value of the immense collections which were displayed in their own museums. The spoils of Syracuse, of Tarentum, of Thermum, and of Corinth were at first no more to them than the elephants which walked in some triumphal procession. They were merely the symbols and the curiosities of conquest. They were no sign of taste, nor did they beget taste for many generations. But this barbarous ignorance could not continue. The guilds of Roman merchants who multiplied and prospered in Delos

and Rhodes began to be infected by the spirit of their neighbors, and to erect magnificent halls and temples. The bequest of the last Attalus conveyed the rich art of Pergamus for administration as a public trust. The value of masterly work in marble and bronze and ivory, as *property*, if nothing else, forced itself upon the mind of the Romans. If they never became artists, they became amateurs and virtuosi. The greed of Verres gave place to the refinement of Lucullus, to the genuine enthusiasm and magnificent patronage of Hadrian.

The marks which Alexander left on India and the far East could not, in the nature of things, be deep or permanent. Mr. Mahaffy, who is here, of course, not on his own ground, sums up this influence as resulting in a wealth of Hellenistic coins, in the Corinthian decorations of certain temples, and in "the spiritual legacy" of the drama. As to the Corinthian architecture of the Grandhara school, Mr. Vincent A. Smith has lately concluded that it is Indo-Roman rather than Hellenic, that it dates from the Syrian expedition of Hadrian, and is derived from Palmyra, while, curiously enough, the later development of this school has the strongest affinities with the Christian art of the catacombs. The kinship and affinities of the Indian drama with the Greek are affirmed, it is true, by the eminent names of Brandes and Windisch; and yet they are denied recently by so high an authority as Schroeder. None of the authorities have ever pretended, we believe, that the Greek had the slightest influence on the *style* of the Hindu drama. Perhaps the Sanskrit is not in its genius susceptible of such an influence. At any rate, the merest amateur, if the amateur has a right to say a word on such a question, must feel when he reads the 'Sakuntala' that in style as well as in setting nothing can be more exotic—nothing more remote in its indolent movement, its tropical color, its cumbrous elephantine periods, its flowery, luxuriant tangle of speech from the simple beauty and directness of the classics. In this respect the two literatures are separated *toto cœlo*; they stand at opposite hemispheres.

For the period of Plutarch, Prof. Mahaffy is quite right in preferring his testimony to that of the monstrous tales of Apuleius, and in his statement that Apuleius and Lucian are romancers borrowing from a common source, Lucius of Patræ, whom Photius mentions. Any reader of Photius must be struck with this. Indeed, Lucian himself was probably the Boccaccio of some earlier folk-tale. He is equally right, at this point, in rejecting Hertzberg, the learned and conscientious historian, who did so much to mark out and smooth Mr. Mahaffy's way. There are certain human documents which can hardly be cited, but which the scholar must study when he writes about morals; and Hertzberg occasionally shows his ignorance of these. He alludes, for instance, to Plutarch's story of the fair and adventurous widow, Ismenodora, who kidnapped a Greek youth as a short and easy way to matrimony, and he compares her behavior to that of "some wayward and strong-willed American lady," whom the learned Doctor may have met in some delusive novel, but never, we trust, in Halle.

The chapters on Plutarch and his times will be found the freshest and most interesting in the book. They analyze and sum up those discussions and moral treatises which the reader of the 'Lives' will hardly venture to explore for himself. They show the sage of Chæronea as, above all, a man of compromises—a philosopher who went far with Plato, and the Stoics, and the Pythagoreans, and stopped short of the extreme views of all; a political thinker who, while writing in Greece, believed in monarchy and in the beneficence of some tyrants, maintained heartily the blessings of the Roman sway and the Roman peace, and yet maintained at the same time the benefit of political parties; a pious lover of the old shrines and sacrifices to Apollo, curious in foreign rites and worship, who yet taught as a monotheist, "in splendid words, the spirituality of God." In politics, he admits that the demagogue had disappeared, yet he shows that there was no chance remaining for the respectable ambition of the statesman. The Empire, which had at last secured social unity in Greece, left room only for a neighborly, self-sacrificing public spirit. In religion, although he knew nothing and cared nothing about Christianity, his tracts are still useful to the moralist; his doctrine of demons who are the *mauvais sujets* of the universe and responsible for its freaks and shortcomings, is still occasionally heard in our pulpits. He represents, indeed, as Prof. Mahaffy says, the spirit of our times, "the spirit of compromise between orthodoxy and scepticism, which gladly listens to the defence of the old and reads with curiosity the assertions of the new." There were substantial reasons, in this period of decline, for maintaining the old shrines, and cults, and ceremonies. They satisfied the curiosity of strangers, they drew crowds and money. Like the Passion Play at Ammergau, the Olympian, Isthmian, and Pythian festivals survived because an old-fashioned pious ritual continued to be lucrative.

If civilization is commensurate with the art of dining, the society of Plutarch which is revealed in the 'Symposium' must be rated very high. The choice of guests, the assignment of places, the *menu*, the delicate question whether one may take with him an uninvited "shadow" (σκιά)—such points as these are discussed with a refinement, a nice observation of human nature, which are entirely modern, which are even *fin de siècle*; and yet when we come to the details of the "table-talk," we encounter *niaiseries*, trivialities of etiquette, and occasional gross breaches of good manners. Indecencies were not to be escaped in the houses of the times, where the visitor is warned to shut his ears "to the outcry of slaves being punished or maids upon the rack"; and where to the deeper curses of slavery were added the slovenliness and indecorum which follow in its train. We should doubtless have found ourselves ill at ease in the best-ordered household of the period. But we should not have found ourselves at home among Swift's gentlemen and ladies, nor in some of those watering-places of the last century whose filthiness and savage manners Miss Hutton's memoirs have lately made us acquainted with. Nor are we sure that the conversations of Shakspere and of Swift are free from that "naturalism" which Mr. Mahaffy, with Hertzberg, complains of in Plutarch and his contemporaries. Plutarch, like most of the Greeks, could not understand Sir Galahad, though Euripides divined and anticipated that type in his "Ion" and his "Hippolytus." "Naturalism," in fact, stands always just outside the door of civilization; it steals inside the door in certain French and English novels. Our moral standards are not really higher than the highest of Plutarch's time; perhaps they are more firmly held and more widely acknowledged; perhaps, when they are violated, we pay them the homage of a keener remorse.

The universal peace which fostered a comparative prosperity in Hellenedom was not so successful in fostering genius and literature. There was no career left for the statesman, the politician, or the orator. The great cities were protected, but they were also caged. The largest questions which agitated the people of Tarsus or Alexandria were whether they were to receive the honor of a visit from the Emperor, or the lucrative privilege of holding the Roman assizes within their borders. There was nothing in such questions to inspire men's souls; and in fact the time was barren. Its great and only birth was Plutarch. The efflorescence of the anthology represented in the epigrams of Meleager of Gadara and of Philodemus was characteristic, but was slight and unimportant. The author of the treatise on "the Sublime" complains, in a passage of dignified melancholy, that genius has been dwarfed and paralyzed by the all-embracing and paternal arms of the Government. There is certainly some truth in the lament. One wonders sometimes whether the communistic millennium of Mr. Bellamy and his friends might not issue in a similar stagnation of intellect and of literature.

What we have in Mr. Mahaffy's 'Problems in Greek History' is in the main a review of his own contributions and methods in the treatment of Greek history and literature, showing how he has anticipated by years and years the results of the most recent research, with a running commentary on the shortcomings of scholars who happen not to know or not to accept views that Mr. Mahaffy happens to know or happens to accept, and with an ever-recurring justification of the perpetual parallel between parties in Ireland and parties in Greece. As to Mr. Mahaffy's anticipations, the matter is very simple. There is an inevitable oscillation in the treatment of all historical and literary characters, and whenever the pendulum has swung back to Mr. Mahaffy's point of view, he gives forth a pæan in honor of his own insight. Men are Herodoteans or Thucydideans as they are Platonists or Aristotelians—it is largely a matter of temperament—and sometimes the Herodoteans come to the front, sometimes the Thucydideans. Those who have read (and who has not read?) Mr. Green's 'Short History of England' were not surprised when Mr. Bryce told us that Mr. Green was an Herodotean, that he saw as clearly as Mr. Mahaffy does that Herodotus's breadth of vision and depth of thought have been disguised by the limpid lapse of his incomparable style. But perhaps Mr. Green learned from Mr. Mahaffy how to appreciate the Father of History. That Thucydides has been overrated as Herodotus has been underrated is not a novel view. There were anti-Thucydideans before Müller-Strübing, as there were pro-Herodoteans before Mahaffy. In the very year in which Mr. Mahaffy was born (1839), Wilhelm Vischer took up the cudgels against Adolf Schmidt and Immanuel Ogienski of blessed oblivion, who blasphemed the name of Thucydides two years before. Mr. Mahaffy's objection to Thucydides's theme is as old as Dionysius of Halicarnassus, and, being as old as Dionysius, is naturally much older; for our Halicarnassian friend cribbed freely. But it would be time wasted to recall Mr. Mahaffy's forerunners, whether orthodox or heterodox or paradoxical. The exaggerated estimate of Xenophon and his fellow-soldiers of fortune which is ascribed by Mr. Mahaffy to the "literary ability" of Xenophon might be as fairly ascribed to the place that the 'Anabasis' has occupied for many years in elementary instruction; and what reader of Isocrates needs to be told that the weakness of the Persian Empire was as

fully revealed by the raid of Agesilaus as by the adventures of the Ten Thousand?

But it is a weariness to see these commonplaces brought out with the air of a revelation —a weariness to be told that Mr. Mahaffy has found it necessary to enlighten the world on the art of Demosthenes and the patriotism of the Macedonian party at Athens. To be sure, he intimates that his remarks are meant for the island to the east of him, but all American scholars read German, and Mr. Mahaffy's advantage over his fellows in this respect does not stir envy on this side of the water. As for the patriotism of the Macedonian party, the introduction to Bernays's 'Phokion' shows amusingly enough how rife in the last century was this game of reading modern history into ancient history.

Of course every reviewer has had his fling at Mr. Mahaffy's weakness for seeing the spectre of Home Rule in every complication of Greek politics, and much of Mr. Mahaffy's space in his 'Problems in Greek History' is taken up with a vindication of his historical parallels; and in what must be considered sheer bravado he repeats his offence at every turn, and crowns his performances in this line by a parallel between the free Greek States in their attitude toward Philip, and the Irish landlords in their attitude toward Mr. Parnell (p. 137). True, he grants that the parallel may "appear far-fetched" "to those who have not studied both cases so carefully as [he has] been obliged to do"; but the whole passage is of a piece with the audacity of the author and his supreme self-confidence.

No one can take up a book of Mr. Mahaffy's without finding samples enough of manly and vigorous common sense, forcible expressions of sound doctrine, flashes of insight, sparkles of wit, ingenious and suggestive combinations; and yet so blurred, so marred, are these excellences by the lack of some of the homeliest virtues of scholarship, that no one who has a jot of the *animus suspicax* demanded of the philologian dares quote Mr. Mahaffy as an authority, by reason of the homage which he pays at the shrine of the great goddess Dash—a more dangerous goddess even than "the great goddess Lubricity," of whom Mr. Matthew Arnold had so much to say towards the close of his career.

CODRINGTON'S MELANESIANS.

The Melanesians: Studies in their Anthropology and Folk-Lore, by R. H. Codrington, D.D., late of the Melanesian Mission, etc. With illustrations. Oxford: Clarendon Press; New York: Macmillan. 8vo, pp. xvi, 419.

In 1885 Dr. Codrington published his elaborate work on 'The Melanesian Languages,' which was duly reviewed in these columns. The present volume is of vastly greater interest to the general reader. The Melanesian race may, at some future time, be studied by an abler man than Dr. Codrington, but long before he could equip himself equally well for the work, the race will have been so modified by contact with civilization as to present a very different object for observation and study. The rapidity with which native arts and methods of living have been, not merely modified, but utterly extirpated, is wonderful. For example, ordinarily the native males of the Banks' Islands went naked, but on certain ceremonial and festal occasions they wore dresses of great beauty. One of these, "a kind of cape, in four oblong parts, beautifully made in colored matting, the highest product of Banks' Island art," is pictured on page 108 of Dr. Codrington's book. On p. 321 the author tells us that the art of making this garment "expired some years ago with the last two men who practised it." Two *malo saru*, as they were called in the native tongue, "probably the only existing examples, are in the British Museum." As Dr. Codrington resided for several years in the Banks' Islands, spoke the language of one of them (Mota) with ease and fluency, had a considerable knowledge of the languages of nearly all the other islands and a very extensive intercourse with the natives, his testimony as to the former existence and the present extinction of the art is indisputable. Again, the native methods of cooking, though slow and laborious, were perfectly adapted to develop in the highest degree the appetizing and nutritious qualities of the products of the native soil. Iron pots and kettles obtained from Europeans are fast supplanting the native ovens. The result attained is greatly inferior, but food easily though imperfectly prepared in minutes is fast triumphing over that perfectly but laboriously prepared in hours. Dr. Codrington frequently alludes, though obscurely and guardedly, to the fact that large numbers of the Melanesian people have been carried off as "contract laborers" to other lands. For this chapter of Melanesian history we must look to other sources. There is, however, a whole volume implied in the name which the natives give to the vessels in which these "laborers" are carried off. They call them "thief-ships." Some of these "laborers" return to their native islands, and bring with them an abundance of the vices and diseases, with but few of the virtues and advantages, of civilization.

More than all other causes combined, the work of the missionaries tends to the utter destruction of the whole fabric of Melanesian society. This destructive effect is by no means confined to the converts to Christianity. Thousands who have not embraced the new faith have learned to doubt the power and ridicule the ceremonies of the old. Perhaps the most characteristic feature of Melanesian life is the existence of "societies which celebrate Mysteries strictly concealed from the uninitiated and from all females." The number of these societies was formerly very great, and initiation into them was eagerly sought. Their mysteries generally had no religious significance—in fact, no importance whatever except in the imaginations of those who had not been admitted to the secret. Partly through the conversion to Christianity of members, partly from other circumstances which we have no space to detail, the secret mysteries of these societies have become generally known. The awe with which they were formerly regarded has died out. Publicity has changed respect into ridicule. A few more generations, and these societies, many of which have existed for centuries, will be known only in the pages of such works as Dr. Codrington's.

We cannot help thinking that it would have added to both the interest and the value of Dr. Codrington's books if he had given a little more prominence to his personal experience and more details of the history of his connection with the Melanesian mission. Beyond a few meagre statements in his prefaces, and an occasional allusion in the course of his works, he has almost entirely effaced all traces of his personality. He became connected with the mission in 1863, and at once enjoyed the instruction and friendship of Bishop Patteson, who was then at its head. Bishop Patteson was one of those rare and remarkable men who to high intellectual and moral endowments join a fineness of ear and a flexibility of tongue which make the acquirement of a new language a matter of hardly more effort than is the learning of a new step to the practised dancer. Dr. Codrington entered upon his duties in the mission school at Mota, or, as it is often called, "Sugarloaf Island," in the Banks' Islands group. He was afterwards connected with the mission school on Norfolk Island. To this school young men were brought, for education, from nearly all the other Melanesian islands. They learned the Mota language quickly and easily, and Dr. Codrington, who had completely mastered that tongue, was thus enabled to prosecute his investigations under exceptionally favorable circumstances. He has also visited many other islands, but of the extent of his intercourse with their inhabitants he does not give us sufficient data to judge. His connection with the mission closed in 1887; from that time until 1891 we may infer that he was occupied in the preparation of the present work. It thus appears that twenty-eight of the best years of his life have been devoted to the study and description of the people of Melanesia. It was a fortunate thing for the students of anthropology that Dr. Codrington's labors commenced when they did. To borrow the language of the sportsman, he may be said to have caught the Melanesian people "on the fly." In most of the islands the ancient beliefs, manners, and customs were still in full vigor. Where they had been affected by contact with civilization there were still even young men who remembered and were able to describe their pristine form. A few more years, and much of the most valuable information which Dr. Codrington communicates would have been unattainable. Later pictures might have been more minute, but they would have been distorted and deceptive images.

The manner in which Dr. Codrington gathered his materials and composed his work was in some respects peculiar. He tells us that his book, "though written by a missionary, with his full share of the prejudices and predilections belonging to missionaries, is not meant to have what is generally understood to be a missionary character." He hopes that it will be of value to missionaries because he "is persuaded that one of the first duties of a missionary is to try to understand the people among whom he works." His object is to help all who may, from curiosity or from the nature of their studies, desire to obtain an accurate notion of that form of society which has been worked out on the Melanesian Islands. His book is intended to be, not a guide to missionaries, but a contribution to the natural history of mankind. Nowhere in the work have we been able to find any trace of theological bias. Nothing is presented as supporting or condemning any theological system or principle.

Another great object of the author has been "to set forth as much as possible what natives say about themselves, not what Europeans say about them." Hence his book consists almost entirely of what fell under his own observation or what was communicated to him by natives. He sought the explanation of what he saw from the natives themselves; and, before accepting their communications as true, he questioned and cross-questioned them with the keenness and persistency of a lawyer trying a difficult case. Some of the most interesting portions of his book are those in which he points out the errors and mistakes to which traders, missionaries, and visitors of all kinds

are liable in trying to gain a knowledge of the beliefs and practices of the Melanesian islanders. On page 22 he says: "It is probably true that in every account of Melanesian affairs given to the world, tribes are spoken of; but a belief that every savage people is made up of tribes is part of the mental equipment of a civilized visitor." As a matter of fact, "there are no tribes among the natives. . . . Whatever political organization can be found can never be described as that of a tribe grouped round its hereditary or elective chief." Again, in treating of the Melanesian religion, he says: "Every one, missionary and visitor, carries with him some preconceived ideas; he expects to see idols, and he sees them; images are labelled idols in museums whose makers carved them for amusement; a Solomon Islander fashions the head of his lime-box stick into a grotesque figure, and it becomes the subject of a woodcut as a Solomon Island god."

There is hardly any subject in the political, social, or individual life of a race which is not treated with more or less fulness by Dr. Codrington. He often regrets, sometimes almost pathetically, the wide interval between the work he had conceived and the work he has executed. The "Folk-Lore" of the Melanesians certainly does not receive in his treatment a prominence corresponding to that given to it on the title-page. At any rate, we have left ourselves room for a bare mention of the subject. There are translations of thirty-one stories occupying fifty-four pages. Dr. Codrington's introduction to them fills a little over a single page. Their prolixity is very great, and the repetitions of the same things in the same language and in the same story are sometimes wearisome. In constructive ingenuity they are inferior to the folk-tales of the western nations. They are fanciful rather than imaginative. As aids to the comprehension of the modes of thought and daily usages of the people they are of the greatest value. A very serviceable index completes this important work.

The Life and Letters of Charles Samuel Keene. By George Somes Layard. London: Sampson Low, Marston & Co.; New York: Macmillan & Co. 1892. Pp. xxii, 463.

It was only toward the end of his life that the very great talent of the late Charles Keene was estimated at anything like its true value. Just now the pendulum has swung very much the other way, and his praises are sung in a high key. He was first admired and understood in France; but the English, having at last awakened to the fact that he was a true artist, seem inclined to get all the glory possible from him, and to proclaim him a greater artist than he really was. One of the signs of this tendency is the present voluminous Life. His career was absolutely uneventful. He was born and he died, and between those two events he produced a vast quantity of work of great merit. He wrote a good many pleasant, gossipy letters to personal friends, which show considerable eccentricity and manias for music and for miscellaneous collecting. This is somewhat slender material for a large book, especially as any criticism of his work is intentionally omitted; but, by dint of a rambling, slipshod style, much repetition and discursiveness, and a great many more of the very similar letters than were necessary, this stout volume has been produced. It is handsomely got up, and contains a large number of good reproductions of drawings and sketches by Keene; and these, rather than the text, are likely to prove the chief interest of the book. Most interesting of all is the carrying out of a suggestion of Mr. Pennell's in the opposing of a *Punch* engraving entitled "Forwards" with a heliogravure of the original drawing. Keene the draughtsman is the only Keene that interests the world much, and these and other plates in the present volume will materially assist in forming a true conception of him, his great merits, and his limitations.

Keene's admirers constantly speak of him as a great technician, and *Punch*, in terms which Mr. Layard acknowledges to be "hyperbolical," called him "The inimitable Charles Keene, universally acknowledged to be the greatest master of 'Black and White' technique who ever put pencil to wood-block!" It is the universality of the acknowledgment, however, not the judgment itself, that Mr. Layard objects to. The judgment he may be said to have made his own. The last part of the phrase is neither here nor there. Keene worked on the wood in his early days, but what counts in his work was done, like most modern illustration, on paper; and it is as a pen-and-ink draughtsman that he will be judged. As a pen-and-ink draughtsman, a master of technique is precisely what he was *not*. Considered with regard to its capability of reproduction, Keene's technique was notoriously bad. *Punch* has always retained the wood-engraver and refused to touch "process." As it is a weekly paper, its engraving is necessarily hasty and poor. Its blocks are unscrewed and delivered to a number of engravers, each of whom cuts his little bit without seeing the whole design. Anything but the merest "near enough" facsimile is rendered impossible by such methods, and the result must be the profound discouragement of a fine draughtsman. The result of this discouragement on Keene was to cause him more and more to neglect the question of reproduction entirely and to treat the drawing as a distinct work of art, without regard to what the engraver might make of it. As the latter was sure to butcher the work at any rate, why consider his capabilities at all? So he invented and made for himself inks of every shade except black, used rough paper to break up his lines, and a pointed stick to give a curious softness of touch. The result is altogether unreproducible except by a process like heliogravure that could as well render pure wash. What the artist suffered in the hands of the *Punch* engravers is almost incredible without the ocular demonstration afforded by the two plates already mentioned.

Considered in itself, however, and with no regard to reproduction, Keene's technique is not a pen technique at all. Working in a material the essence of which is the line, he was almost entirely indifferent to beauty of line. There is no charm of handling in his work, and there is not a square inch of it comparable as technique to that of Abbey or of hundreds of other pen-and-ink men who do not approach Abbey's wonderful perfection. His work must be judged by its contents and not by its manner, if it is to be admired; and it is, so judged, very admirable. The style is a good one only in the sense that it expresses the mind of the artist well and clearly. It is a good style *for him*, not a good pen-and-ink style *per se*.

Keene had not only little feeling for line, but little feeling for beauty as well. Mr. Layard maintains, on the strength of one drawing, that Keene could have drawn beautiful women had he liked; but he does not give the drawing, nor have we ever seen a drawing of Keene's that showed any sense of beauty. And surely, in matters of art, a lack of desire is a lack of power. To say that an artist did not care to draw beautiful faces is exactly the same thing as to say he could not. His nature did not fit him for it.

But if Keene's sense of beauty was small, his sense of character and his sense of humor were very great. The literary humor of his "legends" was, as often as not, another's; but the pictorial humor of the drawings was his own, and it is truly "inimitable." In the rendering of a type, an expression, an action, clearly and firmly, with the slightest exaggeration, yet with a distinctly humorous flavor, he is a really great artist. Although one of the most voluminous contributors to a "comic paper," he was never a caricaturist. His humor is of the fine and serious sort, and may be compared to that of Thackeray in literature. As "documents" for the future student of English middle-class life in the nineteenth century, his drawings will be invaluable. Nor must his skill as a landscape draughtsman be forgotten. His backgrounds are often even more wonderful than his figures, and the way in which wide stretches of country with all their characteristics, and with the sun and wind upon them, are rendered by a few lines and touches, is truly admirable and amazing.

The illustrations in the present volume are not always well chosen, and there is too much of preliminary sketching and scrawling, and not enough of the finished work; but to those who know Keene only from the totally inadequate wood-engraving of *Punch*, they will indeed, as Mr. Layard says, prove "nothing short of a revelation" of the great artist that Charles Keene was.

The Modern Odyssey; or, Ulysses Up to Date. With thirty-one illustrations in collotype. Cassell & Co.

"Ulysses up to date!" Up to what date? No year of date is given in all the volume from first to last. The earliest instance of a date by the day of the month is the author's departure from Honolulu, August 6, and the last instance of that sort is February 16, the day on which he reached Calcutta. In this regard the traveller clearly imitated the fox who ran into his hole and then pulled the hole in after him. But a globe-trotter must leave some telltale traces. Ulysses says that he shipped at San Francisco in July, on the same steamer with Queen Kapiolani. Chroniclers of notable events show that this Queen had landed there on April 20, 1887, on her way to Victoria's jubilee a month later. Now if the Pacific Queen thought nothing else worth seeing after the British pageant, she may have been on the home-stretch within six weeks afterwards. Our hero's wanderings then began in 1887—or a year later if the Ocean Queen deferred her return so long. The reason for thus covering up dates is not apparent. It sometimes gives a traveller a chance to dodge critics, but it oftener opens a weak side for attacks from those who infer his date from his title-page or other circumstantial evidence. Accordingly some readers will think that Ulysses must have put Puck's girdle round the globe before the year 1875, for his collotype of the Acropolis at Athens shows the Frank tower at the entrance, which Schliemann demolished in that year, still standing.

The modern Ulysses caught his love of travel from his ancient namesake. He had studied Greek enough to find the 'Odyssey' no longer "a drilled dull lesson," but the first and best

of romances. In a circumgyration of a year and a day, *visere gestiens*, he skimmed off the cream of five continents and no drop tasted sour. No wreck or even storm, or quarantine, or railroad catastrophe, or other "swift illapse of accident disastrous." Occasionally he met a Circe, or rather Nausicaa, but no Scylla and Charybdis. Only one of the Americans he encountered could he compare to Polyphemus. His sojourns were usually, like that of the wave-worn pilgrim, among hospitable Phæacians, and the last stages of both in hastening home were on a sleeping-car.

The modern Ulysses went with the sun—saw something of the Atlantic slopes, both ours and the Canadian; went westward by the Canadian line; dropped down to San Francisco by water, and so steamed to New Zealand, calling at Honolulu. In that Australian outlier he saw the geyser region, met a Cantab friend, and was then off for Tasmania. Passing to the mainland, he was in Adelaide, Melbourne, and Sydney, and thence by a voyage of twenty-five days arrived in Hong Kong. After a flying trip to Japan, we find him in Calcutta, lingering in cities of the Great Moguls, and from Bombay embarking for Ismailia. Cairo, Athens, and Constantinople interested him, but not, perhaps, more than Sebastopol and Belgrade. Finding at Buda-Pesth that he could reach London in forty hours, he did so.

Our traveller had little in common with that chronic grumbler, the Homeric Ulysses; but then he had nothing to grumble about except an insult to his deck-chair. His greatest hardship was jolting in a hack over New York pavements—a torture to which he feelingly alludes in New Zealand, Jeypoor, and Melbourne as more barbarous than anything in any civilized city. Whatever our Ulysses saw he made a note of. Many of his phrases—as where he terms an ex-President an extinct volcano, a pagoda a pile of hats, the Southern Cross as in shape a schoolboy's kite, and Long Island a whale stranded off New York—must stick in the memories of his readers, as perhaps stuck in his own that phrase of Lowell's in "Cambridge Thirty Years Ago," "his old hats, . . . piled like a black pagoda under his dressing-table." His eye for color is as keen as a mosaic worker's who can distinguish 17,000 nuances. His word-pictures of "September foliage in Vermont" are worthy of Ruskin; but at that season Ulysses was not in Vermont. Chronology convicts him of an alibi at the antipodes. On September 1 he was in New Zealand in "the comfort of Christ Church Club." Yet no Vermonter has so well set forth what he pronounces to be "absolutely the most beautiful sight in the world." From this instance we are led to suspect other alibis in cases where the absence of dates makes it impossible to prove them.

Careless statements of fact are too frequent. Thus, we read: "The system of laying out a city in blocks was only adopted west of India within the memory of living persons." Ulysses must be old indeed if he can remember the laying out of Philadelphia. Ulysses gives many good etymologies, but what he says as to the origin of Lachine contradicts Parkman and chronology. He speaks of Michigan as one of the Eastern States, says that Chicago's population is over a million, and yet reckons Brooklyn the third city in the Union. "The Dutch possessions in the Malay archipelago" are said to be "of recent acquisition." The fact is that they began in 1596, and were large before England had even one trading-post in India. "Ticonderoga," says Ulysses, "was held by a British garrison until the close of the Revolutionary War." It was really held by the British no more than four months during that contest, and was given up four years before Cornwallis gave up Yorktown. The chapel at West Point is declared the only place in the world in which such a trophy as a captured British color may be found. Some were, however, shown in St. Petersburg to the writer of these lines, and such trophies were numerous in Paris till the fall of the first Napoleon. "The only existing monument on which the defeat of a British fleet is recorded" is stated to be in Cleveland. Had the writer visited the Plattsburg cemetery he might have seen another. Indeed, he does himself say that "a British fleet was defeated there," but his account of that place may have been evolved, like that of autumnal Vermont, from his internal consciousness. The remark that "Washington is included in the long list of capitals in various parts of the world which have been occupied or taken during the present century by British troops," cannot nowadays vex Americans. It is atoned for by the author's doubt whether the growth of Washington is more impeded by Congressional members or by mosquitoes. But arrogance is natural in a traveller who, while swinging round the great circle, is always on English ships, in English colonies, or in countries which English commerce and the English language hold in a sort of subjugation, by bonds lighter than air but stronger than iron.

La Débâcle. Par Émile Zola. Paris: Charpentier; New York: Westermann. [*The Downfall.* Cassell Publishing Co.]

It is so unusual an occurrence for M. Zola to publish a book of which much good may be said, that there is a chance of its not being praised as it deserves. The writer has got a bad name, and most deservedly so. He has wilfully and of malice prepense plunged into the vilest scenes and dragged his reader with him. What has made the judicious grieve all the more is the undoubted power of the man; there are many pages, even in his worst books, which are simply superb. In 'Germinal,' the scene where the troops are assailed by the mob of strikers is, barring the abundance of gross coarseness and so-called realism, one of the most forceful ever penned, while the description of the sunset over Paris, in 'L'Œuvre,' is a simply beautiful bit of descriptive writing. But who cares to wade through quantities of filth to pick up here and there a gem? It is to the author's credit that in 'La Débâcle,' while he has not wholly freed himself from the shackles of his besetting sin of disgusting sensuality and crude language, he has largely avoided it—rather, perhaps, been so carried away by his subject as temporarily to forget his propensity.

The book, in its construction, reminds one, oddly enough, of Corneille's 'Horace.' The first part is intensely interesting, notwithstanding a superfluity of detail akin to Victor Hugo's; the second part is as awkwardly joined on as the fourth and fifth acts of the tragedy, and with less excuse. The first part is the story of Sedan, with all its attendant horrors, miseries, and despair. The second is a wild and rather incoherent rush from the time of the Emperor's capitulation and surrender to the fall of the Commune. This latter portion may practically be left out of consideration; it is in every way inferior to the former, in which M. Zola, handling a theme which calls out his best qualities and his greatest powers, almost deserves the epithet of epic poet which some of his too ardent admirers claim for him. He shows the French army setting forth in undoubting assurance of speedy victory, and rapidly disintegrating, falling to pieces, melting away, a prey to panicky terrors, to unreasoning, mutinous spirit, to mistrust of incompetent chiefs, to hatred of the Emperor, who, pale-faced, wan-eyed, ghastly as a spectre, passes now and then across the bloody stage. The brilliant bravery of the French troops under most disheartening circumstances, the terrible encounters in which all the brutality and atrocity of war are seen, the steady purpose of the German host relentlessly closing in upon the doomed army, the horrors of Bazeilles, the desperate defence of Weiss's house, the return of Weiss's wife, her arrival at the moment when her husband is shot down by the victors, the hideous scenes in ambulances and hospitals, the mad efforts to break through the circle of fire, and the hopeless falling back of the shattered and decimated regiments—all this is told with consummate power, and justifies the praise awarded to the writer who has succeeded in drawing so vivid, so forcible, so poignant a picture of the days of doom and distress. That it has all been told before is true; but it has not been told as M. Zola tells it. Here, in spite of the mass of detail, we have real composition, a grouping of facts and events—a piece of artistic work, in a word. Marred, it has already been said, too often by the unhappy tendencies of the author, by mannerisms of style, particularly antithesis, by extraneous and unnecessary episodes, by assumption of knowledge and intuition on the part of privates which not only is not realistic but is actually impossible, 'La Débâcle,' maugre all faults, stands out as Zola's best and strongest work up to the present time.

BOOKS OF THE WEEK.

An Englishman in Paris. 2 vols. Appletons.
Apgar, A. C. Trees of the Northern United States. American Book Co. $1.

READY AUGUST 20:

Select Cases on Evidence

AT THE COMMON LAW.

WITH NOTES.

A Text-Book for Students. By JAMES BRADLEY THAYER, LL.D., Professor of Law at Harvard University.

One volume, pp. 1,200. Cloth, strongly sewed, $7.50, net; half calf, $8.50, net.

Orders received by

CHARLES W. SEVER, PUBLISHER,
CAMBRIDGE, MASS.

MONTHLY CATALOGUE OF GOVERNMENT PUBLICATIONS.

Edited by J. H. HICKCOX.

The publication of this valuable record was suspended from want of support. We are happy to announce that arrangements have been made to continue its issuance. For particulars and sample copy address the publishers,

W. H. LOWDERMILK & CO.,
Dealers in Government Publications,
WASHINGTON, D. C.

F. W. CHRISTERN,

254 Fifth Ave., between 28th and 29th Sts., New York, Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogues of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing to us. Special collections formed, and fuller information supplied than from any other house. Books both old and new, and relating to any subject, can readily be supplied at very moderate prices.

Agents for Clubs, Libraries, and all private Collectors.

187 PICCADILLY, LONDON W.

JOHNS HOPKINS UNIVERSITY

BALTIMORE.

Announcements for the next academic year are now ready and will be sent on application.

BRENTANO'S FIRE SALE,

Now going on at the JACKSON BUILDING, No. 31 East 17th St., three doors east of Broadway. The entire stock of Books, including all fields of literature, science and art, and French and German books, is offered at *greatly* reduced prices. A catalogue is now in preparation, and will be sent postpaid to any address upon request. Orders by mail promptly attended to. Address

BRENTANO'S, 31 E. 17th St., New York.

Common Words Difficult to Spell.

A graded list of 3,500 words that experience has shown are most frequently misspelled. Dictation Exercises from Lowell, Hawthorne, Emerson, Irving, Addison, etc. Cordially endorsed by superintendents and teachers. Specimen copy, postpaid, 24 cents. JAMES H. PENNIMAN,
4322 Sansom Street, Philadelphia, Pa.

"*The weary brain requires some nerve sustaining element as food.*"—HERBERT SPENCER.

Crosby's Vitalized Phosphites.

The vital principle of animal and vegetable life isolated from the ox brain and wheat germ.

The loss of memory, the tired and exhausted feeling, the dull, unrefreshed sleep, or nervous sleeplessness, brain weariness, depressed vitality, are simply the brain and nervous system calling for their necessary food. In this condition the Vitalized Phosphites give great relief. It restores the true protagon, the brain phosphoid, increases brain and nerve power by specially feeding the nerve centres. It reinvigorates brain and body.

For thirty years endorsed by leading physicians and the world's best brain workers. Formula on the label. Pamphlet free to those who write for it. Druggists or by mail, $1.00. 56 W. 25th St., N. Y. *F. Crosby Co.*

Horsford's

ACID PHOSPHATE,

Recommended and prescribed by physicians of all schools

FOR

DYSPEPSIA, NERVOUSNESS EXHAUSTION,

and all diseases arising from imperfect digestion and derangements of the nervous system.

It aids digestion, and is a brain and nerve food.

The Nation.

NEW YORK, THURSDAY, AUGUST 11, 1892.

The Week.

THE statement put in print by Congressmen Sayers and Dockery of the House Appropriations Committee shows that there will be a deficiency of $52,365,820 in the current fiscal year according to the appropriations made and the estimates of revenue submitted. The appropriations for the year ending June 30, 1893, are $507,701,380; estimated revenues for the same period, $455,336,350. Among the permanent appropriations included in the total is that for the sinking fund, $48,632,000. The law requires that this sinking-fund payment shall be made in each fiscal year, but Secretary Foster has construed *each* fiscal year to mean *any* fiscal year, and has accordingly taken credit for previous redemptions of the public debt that were over and above the stipulated amount of the sinking fund. Messrs. Sayers and Dockery say that he has no choice but to omit the sinking-fund payment. He has not the money to make it. In fact, he has not enough to make the necessary payments. The last Congress botched its job tremendously. It added $50,000,000 to the pension largess, and it knocked off $50,000,000 of income by repealing sugar duties, and then it added $10,000,000 of sugar bounties because it had repealed the duties. This depletion of revenue and paying of bounties was believed to be necessary in order to make the McKinley Bill acceptable to the taxpayers. It was necessary to show them some relief to compensate for the exactions of the protected classes. So the sugar duties were thrown over—all except what belonged to the Sugar Trust. The grand result of new pensions, bounties, and free raw sugar is a difference of $110,000,000 "to the bad" in the national book-keeping. By ignoring the sinking fund, the actual deficit for the year will be only three or four millions, but the Pension Bill will be larger in the next fiscal year—Senator Gorman says $20,000,000 larger. There may be some increase of revenue owing to increase of population and of trade, but not nearly so much as this. There seems to be no alternative but an increase of taxation.

The Alabama election proves to have been much closer than the first returns indicated. It now appears that Kolb, the opposition candidate, received fully half of the white vote, and probably a little more; and that Jones, the regular Democrat, owes his majority of about 10,000 in the whole State to the "black counties," where he secured the bulk of the negro vote. This shows that the opposition to the regulars was much more determined than had been anticipated. But it does not indicate by any means that the same division among the whites will continue through the Presidential campaign. The recent contest was between two candidates who had always been Democrats, and the Republicans could not profit by any result of the election. But henceforth the issue will be whether men who have heretofore voted the Democratic ticket in Presidential elections shall cast their ballots next November in such a way that the Republicans may be able to get more votes for the Harrison and Reid ticket than are cast for either of the other tickets. There is consequently no reason for the assumption that last week's election means that Alabama is a doubtful State in November, as national issues will doubtless bring most of the Kolb bolters back into line. The solidity of the white vote in the South since the war has been an abnormal thing, which every one of sense has recognized as only temporary. It would have been broken long since if it had not been for the threat of Force Bill legislation, and it is the threat of such legislation which assures Democratic union in this year's Presidential election at the South, however much favor the whites may lend independent State movements like that led by Kolb.

Michigan makes a happy escape from the muddle over the division of the State into legislative districts. It will be remembered that the Supreme Court recently annulled by a unanimous decision the apportionment made by the last Democratic Legislature, on the ground of its unconstitutionality in not making the districts of equitable dimensions, and at the same time passed similar judgment upon the Republican apportionment of 1885, declaring that "for many years the apportionments made by the Republican Legislatures have been thoroughly partisan and inconsistent with the direct language of the Constitution." The Governor thereupon called a special session of the Legislature, which has agreed upon a measure so just to both parties that it received almost a unanimous vote, and is admitted by Republicans to be fair. Why could not the Democrats have submitted such a measure at the regular session, and thus saved all of this bother and expense?

Judge Rumsey's decision in the Monroe Co. (N. Y.) case, declaring the Reapportionment Act passed by the last Legislature to be unconstitutional, was not unexpected. The question will now be carried to the General Term and thence to the Court of Appeals, with the prospect of a final decision early in October. Judge Rumsey puts aside two of the objections to the act, that the enumeration was taken in 1892 instead of 1895, and that the extraordinary session which passed the act did not follow the constitutional requirement that the apportionment should be made at the first session after the enumeration, by saying that they have already been settled by courts of high authority. He rests his decision on the two remaining grounds, first, that persons of color not taxed were included in the enumeration, though the Constitution forbids such inclusion; and, second, that the apportionment of several Senate districts and the division of some of the Assembly districts among the counties were so unfair as to violate the constitutional requirements. As the higher courts are to pass upon these points, it is manifestly a waste of time for laymen to express opinions upon them.

The believers in a single tax seem to have at last been able to make a practical application of their theory, according to a report that comes to us from Maryland. At a town in that State called Hyattsville, where many persons employed in Washington reside, the commissioners empowered to assess property for taxation omitted from their assessment all personal property and all improvements upon lands, thus carrying into effect Henry George's ideas. Some of the owners of unimproved property, conceiving themselves to be unfairly taxed, applied to the court of that district for a mandamus compelling the commissioners to restore improvements upon land and personal property to the assessment list, but the court refused their request, upon the ground that the Legislature had made the decision of these commissioners final. Inasmuch as the Constitution of the State of Maryland requires all property to be taxed equally and as personalty and improvements upon land are unquestionably property, we do not understand how this decision came to be made, and it may have been incorrectly reported. Undoubtedly an appeal from it will be taken, the decision of which will be of no little importance, if, as we apprehend, it shall make it plain that the single-tax men cannot apply their theory until they have amended the constitutions of our States. What they may accomplish, and what even those who differ radically with them may hope that they will accomplish, is to check the tendency to multiply taxes. Although we cannot see our way to a single tax, we may at least contrive to raise sufficient revenue with fewer taxes than at present.

The *Tribune* has devoted much time and pains to the preparation of a table of American millionaires, and has brought

together for the admiration of its readers the names, residences, and occupations of some four thousand people whose fortunes are believed to have passed the million-dollar mark. So much snobbery would clearly be wasted unless a moral were to be drawn; hence it is not surprising to find the *Tribune* remarking editorially: "The roll is an exceedingly interesting one, and the political point which it proves is unanswerable." Anybody who was disposed to "answer" the *Tribune* would be somewhat puzzled to know what was the conclusion which he must dispute. The *Tribune's* special tariff editor, who (quite in the line of his business, one might suppose) was detailed to collect the statistics, affirms that out of a total of 4,000 American millionaires, only 1,125 "obtained their wealth through protected industries." This would lead one to suppose that the *Tribune's* "unanswerable political point" was the existence of many great fortunes built up without Government assistance. We suspect that nobody will be hardy enough to contest this "point," though the labor of canvassing 4,000 American millionaires seems a trifle disproportionate to the logical results established. But the *Tribune's* tariff editor does not seem content with his axiom, and, in fact, appears uneasy lest he had actually proved too much. By way of qualification, he adds that "if all the fortunes of the United States, large and small, had been made under the protective tariff, that fact might be a powerful argument in favor of such a tariff." But if this be true, we should suppose, after the contempt with which the *Tribune* treats the insignificant item of 28 per cent., the total proportion of "protected" millionaires, that it regarded the protective idea as, on the whole, a failure.

We extend our sincerest condolences to the Republican candidate for the Vice-Presidency in the prolonged and irritating trouble he is having in reaching a final settlement with Typographical Union No. 6. It has been announced many times since his nomination that everything was satisfactorily arranged, and that the settlement had been formally ratified, but each announcement has been followed by fresh complications, requiring fresh settlement. There was another "final" meeting on Sunday, and though the *Tribune's* account gives the impression that the trouble is ended for ever now, there are intimations in other reports which cast grave doubt upon this point. The *Tribune* declares that all the trouble from the beginning has been caused by a "certain noisy but unimportant contingent of the organization that is more desirous of serving the Democratic party than of furthering the interests of the Union"—a statement which seems to show that the surrender of the *Tribune* to the Union has not been followed by the "turning over" of all the Union's votes to the Republican ticket. One of the Union orators, according to the *Tribune's* report, said that "Mr. Reid had really done more than was required by the terms of the settlement," but it was evident from the remarks of another orator, not reported in the *Tribune*, that he had not done more than would be required before peace would come, for this orator declared that "all Big Six has gained thus far is a foreman and a few compositors"; that "rats" were still employed in the *Tribune* office, every one of whom "must go" before the boycott against the office could be declared "off"; that members of the Union should at once be given the places held by non-union men, and that the use of type-setting machines was an anti-union device which ought to be denounced and its abolition from the office demanded.

All this shows that the "final settlement" is still in the distance, and that the crucial test of the entire negotiation will come when the demand is made for the abolition of the machines. It is a peculiarity of Big Six that its "demands" increase in proportion to the readiness with which they are granted. If it be true that Mr. Reid has yielded even more than was asked, he has invited all the trouble he is encountering, and he may as well make up his mind that the demand for the machines to "go" will come presently, and that the final delivery of the "vote of organized labor" will hinge upon that. He will learn from the resolutions adopted by the typographical union of Utica on Sunday that his yielding to Big Six has had very little influence for good upon other branches of typographical union labor, for he is denounced therein as having "been for many years the merciless, hateful foe of organized labor in every form, and especially the Typographical Union"; is charged with "persistently and maliciously attempting to destroy" that Union; is accused of having obtained his nomination by means of a "conspiracy between himself and a clique whose motives were entirely selfish, and whose action has been condemned and repudiated by those whom they professed to represent"; and the Republican party is charged with "designedly and malignantly insulting the members of this union and all wage-earners" in making Mr. Reid a candidate. Finally, the Utica printers pledge themselves not to vote for Harrison and Reid, and call upon all friends of workingmen to help in their defeat. All this must be very discouraging to the only typographical-union candidate for the Vice-Presidency that there is in the field, for it amounts to a flat refusal to deliver the goods as per agreement. The bolt in Omaha is another sign of the same purport.

It is not alone in this country that typographical unions seek to profit by the ambitions and fears of place-holders and place-seekers. The French Minister of Commerce has recently had the club of organized typographical labor shaken over his head. It seems that the principal of a school in Lyons had set out to establish a course in practical type-setting for girls. As soon as the Lyons Typographical Union heard of this, it wrote to the Minister of Commerce demanding that he veto the proposed course, and this demand was immediately seconded by the national federation of printers. This made the affair serious enough to cause Minister Roche to submit it to the Superior Council of Labor. Objection was made to the plans of the Lyons school, both on the score that women should not be allowed to engage in any unhealthy calling, and more especially that they should not be permitted to compete with men in a trade already overcrowded. Back of all lay the common trade-union hostility to training-schools of any kind, even for men. No adequate presentation of the other side appears to have been made to the Council of Labor, yet that body has so far refused to go the lengths demanded by the printers. Meanwhile Minister Roche is left in an embarrassing position. On the one hand, he dare not come out as an enemy of organized labor, but, on the other, he knows that if he decides against the training-school in question, he will next be called upon to abandon the whole system of technical education, upon which the country has already expended many millions.

Another illustration of the way the Administration used Federal offices to secure Harrison's renomination is afforded by the story of the post-office at Princess Anne, Md., as told by E. F. Duer, the late Postmaster. Duer was appointed about three years ago, and has managed the office so successfully that it was not long ago raised to a higher grade, which brought the place within the range of a Presidential appointment. The rule in such cases is for the President to name the incumbent if his record has been a good one, and if his continuance is desired by the patrons of the office. There is no dispute whatever as to Duer's efficiency, or as to the satisfaction of the local public with his administration. He filed his papers with the Department in due course on the 18th of May, and was told by the Fourth Assistant Postmaster-General that the appointment would not be made before fifteen days. Notwithstanding this, seven days later, W. F. Lankford was appointed, without even a notice to Duer that his claims would be heard, and without any examination by the Postmaster-General of the papers which he had filed. The explanation is that Lankford's name was presented by Thomas S. Hodson, who was a delegate to the Republican National Convention, then soon to meet. As Duer says in his letter to the Postmaster-

General: "How far these things stood to each other in relation of cause and effect, is a question which each one can decide for himself; and in view of the charges generally made as to the manner in which the President's renomination was effected, it may prove an interesting question."

Mr. Wanamaker's letter in reply virtually confesses the truth of the indictment. The Postmaster-General makes no attempt whatever to show that Duer had not been a thoroughly efficient postmaster, that his administration had not been entirely satisfactory to the public, or that he was not as much entitled to retention in his place as would be any faithful and capable clerk in his Philadelphia shop. The most interesting point in the letter is its reference to a new element in our politics—"the referee." Says Mr. Wanamaker:

"While it is true that many of the incumbents of fourth-class offices are reappointed when the offices become Presidential, there is a considerable percentage that are not reappointed, and for good and sufficient reasons not always known to the Department, inasmuch as the recommendations of the Senators, members, *or referees* resident in the districts where the offices are located, mainly are followed."

It further appears from the Postmaster-General's letter that "the referee" in the Princess Anne case was one Russum, and that the change in the office was made at Russum's demand. "I personally saw Mr. Russum," says Mr. Wanamaker, "and he told me that he desired the appointment made that Mr. Hodson recommended"—that is, the appointment of Lankford in Duer's place. In a second letter to the Postmaster General, Duer makes all the comment that seems necessary upon this extraordinary revelation, when he says:

"With the frank statement contained in your letter as to the manner in which my successor was appointed, I am compensated for my trouble I took to write to you. The referee system, which under this Administration has completely disorganized the Republican party in this district, was supposed to be based on the theory (never carried into practice) that the referee would act impartially and give his endorsement according to merit. I am glad to have it over your hand that in the Post-office Department at least the spoils system prevails to such an extent that the referee can not only bestow the offices, but can even transfer his power of bestowing."

The *World* publishes a batch of letters written by Robert P. Porter, Superintendent of the Census, showing how he (Porter) had been acting as agent for a particular brand of champagne called Berton Sec while he was editor of the New York *Press*, booming it as the "great Republican wine," and that he continued to boom and drink Berton Sec after he received his census appointment. Among other incidents was the sending of five cases of the wine to President Harrison, which were refused by the steward of the White House as not ordered by him. Subsequently it was arranged with Private Secretary Halford that the wine would be received and consumed on condition that it was not to be paid for. Mr. Cornelius N. Bliss was favored with a gratuitous consignment also, as it was believed that he would know the difference between Republican and Democratic wines by taste, if not by an inspection of the labels. Mr. Bliss, however, declined to accept it, saying that he was not in the habit of accepting gifts from strangers. Various other well-meant attempts to establish Berton Sec as the party drink are recorded, among others a coolness between Porter and Chamberlin, the restaurant man in Washington, for which the latter sought an explanation and was informed by the Census Superintendent that it was because he (Chamberlin) did not keep Berton Sec. "I told Chamberlin," wrote Porter to the wine merchant, "a Republican Administration wanted Republican wine." The greatest success was scored by Porter when he got the Berton Sec adopted at the big Carnegie dinner in Washington. This triumph was described on Census Office paper, with the word "Glory" written at the top, as follows:

"Just think that the grandest banquet given here by the Administration, as it were, had no Mumm, no Pommery Sec, no Piper Heidsieck, and no other second-class wine, but only Berton Sec. In the name of heaven, have a lot of these bills printed, and let these one-horse restaurants and wretched hotels in Washington see that the best wine in America to-day is Berton Sec. Let them understand that when a man like Carnegie gives a dinner which is admitted to be the grandest of the season, that he has the good sense to select Royal Berton Sec."

The agency came to an end by reason of a dispute about $150, which the wine merchant claims is due him for money advanced to Porter to be spent for wine at the Tariff League dinner in 1889. Why does not the Tariff League pay the money at once, and stop the guffaw?

Prof. Soetbeer, the German economist and statistician, has made a suggestion to the coming international monetary conference which is entirely practicable, although it does not introduce international bimetallism. He proposes that silver coins shall be struck by all the countries at the ratio of 20 to 1, and shall be legal tender up to $20. The object of this is to lessen the danger of counterfeiting silver coins. At the present time the subsidiary coins of all countries have a bullion value about 50 per cent. less than their nominal value, while the full legal-tender coins — thalers in Germany, five-franc-pieces in France, and dollars in the United States—are more than 30 per cent. overvalued. The temptation to counterfeit is very strong. It is certainly desirable that it should be repressed, and as we are to have an international conference, it would be well to have a recommendation on this subject. It is not probable, however, that the nations of Europe which have ceased to coin silver of full legal-tender power would recoin their existing stock.

It appears, contrary to our recent comment on the political situation in Norway, that Emil Stang, Steen's conservative predecessor, and not Steen, has been recalled; further, that the King's opposition to the radical plan, and his prompt acceptance of Steen's resignation, were based, not upon the merits of the case, but on the manner in which it was presented. By handing in his resignation, Steen made himself and his measure politically impossible. Instead of discussing the question of a separate consular service for Norway in the Norwegian Council, thus allowing the King to express himself officially on the subject, Steen demanded a private audience with his Majesty, and unceremoniously tendered his resignation. Oscar, of course, as King of Norway, can accept no change in the consular service or in any other purely Union matter without first as King of Sweden gaining the consent of the Swedish Parliament and Council. This is not Swedish interference, it is merely the application of a principle of partnership that requires the consent of both parties to any change. We have little doubt that Norway's demand will ultimately share the fortune of all its predecessors, but only when it is presented in a constitutional manner and with a due consideration for the senior member of the firm.

A noteworthy incident occurring in Rio Janeiro a short time ago shows the view taken by the Catholic Church of the parties and methods at present dominant in Brazil. A Colonel of the National Guard went with his staff to the Cathedral and asked the Bishop of the diocese to bless the flag of his regiment. The Bishop refused, and, in order that there might be no mistake about his motives, made a short address giving the reasons for his action. He said that the blessing of a nation's flag signified the desire of the Church to see the legitimate glory of the country maintained and extended, and that the Church would be glad, now as in other days, to give her approval in that way to true patriotic sentiment. "At present, however," he continued, "I cannot bless this banner which is brought to me, since it does not represent simply the national sentiment, the union of Brazilians and the love of country, but is merely the symbol of a faction." He added that he would pray that the national standard might come to signify the union of all Brazilians. That the present Government of Brazil is nothing more nor less than a military oligarchy is sufficiently clear. One instructive bit of evidence bearing on the question is the great increase of the sums spent on the army since the "Republic" was introduced. In 1888, the last full year of the Empire, the budget of the War Department called for $7,500,000. In 1890, the first full year of the Republic, the amount was $14,800,000, and the budget for 1893 calls for $15,650,000.

THE WORK OF CONGRESS.

THE adjournment of Congress always brings with it a feeling of relief to the country, and it has become almost the rule to estimate the merits of this body according as it has left undone those things that it ought not to have done, but which it was feared it would do. By the peculiar Constitution of the United States, which recognized to an extent unparalleled elsewhere the institution of local government, the principal functions of the general Government were limited to the maintenance of the post and of the Federal judiciary, and to the care of foreign relations, with the necessary provisions for defence thereupon attendant. The civil war gave to the National Legislature a prominence that it had never before attained, with the result that it has steadily increased its functions and enlarged the sphere of their application. This involved increased expenditure until the country was startled to find that the last Congress had contrived to impose upon it taxes amounting to about a billion of dollars—a discovery which helped to bring about a political revolution in the constitution of the House of Representatives.

The enormous majority of the Democratic party in the present House was regarded with apprehension by its most intelligent leaders, and the result has, to a certain extent, justified their fears. To subject a vast crowd of new members—many of them owing their election to such elements as the People's party or the Farmers' Alliance rather than to the regular Democratic voters—to the discipline required to make party government effective, proved to be impossible. An unfortunate intrigue, which involved much bargaining concerning the Presidency and the Speakership, occasioned bad feeling at the outset, and the determination of a certain section to obtain free coinage for silver, persisted in so desperately as to show that, in many cases at least, it had the strength of a religious conviction, prevented that hearty coöperation which is indispensable to the success of any policy in a legislative assembly. As a consequence, the attack upon the tariff was delayed so long as to lose its effect upon the country and to enable the Senate to avoid meeting it, the scandals of the Pension Office were only recently exposed, and the Census Bureau escaped investigation altogether.

It is important to remember, however, that these failures or ineffective attempts have been disadvantageous only to the interests of the Democrats as a party, and that the interests of the country at large have not suffered by them. It was the policy of the Republican party in the Senate to stand by the tariff, and if it had been overcome, the President would unquestionably have vetoed any measure of reform. The Census Bureau and the Pension Office he is directly responsible for, and, so far as we know, no Republican voice has been heard to criticise the methods prevailing in these departments. The scandalous bank frauds in Philadelphia involved so many Republican politicians high in the counsels of the party as to make it safe to say that if the obstacles that were laid in the way of investigation had been overcome, others that could not have been overcome would have succeeded them. Upon the whole, it seems fair to say that no great reform measure adopted by the Democratic House could have passed the Republican Senate, or, if it had, would have been accepted by the President. So far as we have observed, all Republicans concur in this view. Under these circumstances it is obvious that the lack of energy on the part of the Democrats, however detrimental to themselves, has occasioned no injury to the country. Neither the eloquence of Demosthenes nor the invective of Burke would have convinced any representative of a protected interest that it was not a good thing for him to compel his countrymen to buy their goods at his shop. Such men consider that they own the Government, and the only way to deal with them is for the people to replace them with men whose views are more enlightened and whose moral sense is keener.

If we turn from the sphere of the ideal but unattainable to that of the common place but practicable, we find that the Democrats of the House have rendered much greater services to the country than has been commonly supposed. The evidence of this is to be found in a six-column account of the doings of Congress published by the New York *Tribune*. It is hardly necessary to say that this account is not likely to state the Democratic case too favorably. On the contrary, it exhausts the vocabulary of billingsgate, and, so far as general statements are concerned, makes out a Democratic record "so black that charcoal would make a white mark upon it." With a single exception, if we are not mistaken, all measures passed by the House and not concurred in by the Senate are described as the product of ignorance, folly, and knavery. Upon all points of difference the action of the Senate, as here represented, was marked by intelligence, wisdom, and patriotism. In the case of the bill for the free coinage of silver, it is true that the House rejected it after the Senate had passed it; but whatever discredit attaches to the Senate on this account, in the *Tribune's* view, belongs to its Democratic members, while all the credit for defeating the measure in the House belongs to the Republicans.

If we descend to particulars, we find that the standard of wisdom and honesty adopted by the *Tribune* is a simple one. Any attempt at economy is denounced, and every increase of expenditure, and therefore of taxation, is approved. The Democrats may well be content to go to the country upon this principle, and upon the comparative table of appropriations furnished by the *Tribune*. As to certain matters, Congress has no discretion. Thus, the *Tribune* states the permanent annual appropriations of the first session of the last Congress at about $101,628,000, while those of the present are $121,863,000. Here is an increase of $20,000,000, for which the Democrats are not responsible. The appropriation for the Post-office is about $8,000,000 more than before, but this office is nearly self-sustaining, and it is not apparent that the increased appropriation implies any increased deficiency. The appropriation for pensions has increased from $98,457,000 to $146,737,000, say $48,000,000, for which the responsibility is with the Republicans. It seems, therefore, that in order to carry out the existing laws it was necessary for the House to appropriate $68,000,000 more than was required at the first session of the last Congress. If we add to this the $8,000,000 additional for the Post-office, which presumptively does not involve an increase of taxation, we have $76,000,000 as the increase inevitable if the present Congress were to make no improvement over the last one. The *Tribune* shows that the appropriations at the first session of the last Congress were about $463,400,000, while at the corresponding session of the present Congress they were about $507,970,000, the difference being, according to its statement, about $35,000,000. There is evidently some blunder here, as the increase would be nearly $10,000,000 more than this, and probably the *Tribune* has obtained its total of nearly $508,000,000 by including the National Bank Redemption Fund, so that the proper total is about $498,500,000, the increase being $35,000,000, as stated. An increased expenditure of some $75,000,000 in certain directions being unavoidable, owing to the pension and silver and bounty legislation of the Republicans, the Democrats succeeded nevertheless in economizing in other directions to the extent of $40,000,000. If we were to compare the appropriations of this session with those of the last session of the previous Congress, which were $525,000,000, the gain to the country by depriving the Republicans of control would seem to be much greater; but this gain has still to be realized.

There seems to be still some uncertainty as to the actual amount of the appropriations, and we do not vouch for the correctness of the *Tribune's* figures. Taking them as correct, however, the Democrats need not fear the popular judgment upon them. The *Tribune* actually reproaches the Democrats for reducing the "miscellaneous" items from $7,000,000, their amount under Republican management, to $800,000. The wider the publication of such charges as this, the better for the Democrats and the better for the country. As to the other work of Congress, it has not been of special importance.

THE TYRANNY OF "LABOR."

WE have heard a great deal of late from demagogues about the tyranny of Capi-

tal. It is high time for the public to realize the tyranny which "Labor" is establishing in this country. The new despotism is that of the "Union," or "Organized Labor." A small percentage of the men employed in any industry form an association, nominally for mutual improvement and benefit. This union proceeds to lay down rules for the regulation not only of its own members, but of all other laborers and of employers. It decides what the rate of wages and the number of hours ought to be, and serves notice upon all concerned of its decision. It establishes a code of rules to regulate the conduct of its members and their relations with their employers, and it permits no violation of this code. It determines what shall constitute fidelity, industry, and proper subordination on the part of an employee, and it will allow no member to be discharged for unfaithfulness, laziness, or insubordination unless the union holds him to be guilty. It asserts a monopoly of the labor market, and will allow no man who does not belong to a union to do a job of work if the union has thrown it up. It resorts to boycotting, abuse, violence, and even murder, in order to "assert its power."

The slaveholder of the South in antebellum days enforced his rule through an overseer. The place of the overseer in this new form of servitude is taken by "the walking delegate." The walking delegate is a man who receives four or five dollars a day for doing nothing except make trouble between the employer and his employees. As he must make some pretence of earning his pay, he never means to allow a long time to elapse without making some trouble. The *Herald* of Thursday gave this picture of the walking delegate, as drawn by the Secretary of the Board of such delegates the day before:

> "They are only common, every-day workingmen, and their careers have consisted in handling their tools of trade. Each delegate is boss of his own men until meeting night, and then all hands are liable to jump on him and make him very tired. Between meetings his word is law. He can order any man under him to strike at any time, and the latter must obey without a question. The walking delegate goes round from building to building in course of construction, and if his eagle eye sees anything going wrong—non-union men at work, for instance, or boycotted material—he applies the thumbscrews at once."

The intolerable nature of this tyranny has never been made so clear as this summer. The case of the Grand Central Hotel on Broadway is a typical one, which deserves careful attention. Tilly Haynes, a Boston hotel-keeper, some time ago leased the Grand Central, and came to this city to expend $100,000 in the work of renovation, of which fully three-fourths was to go for labor. He made terms with his men which were mutually satisfactory. Work had hardly been begun, however, when the walking delegate appeared and demanded that the men should work only eight hours a day, instead of nine. Mr. Haynes acceded. A week later the walking delegate came round again, and said that some of the carpenters were working for $3.25 a day, and that they must be paid $3.50. This demand also was yielded to. A few days later the delegate informed Mr. Haynes that he had two stairbuilders from Boston, and that, although these men were union men, they could not work unless they had their union tickets changed, and paid the fee for working in this city. This trouble was settled by the return of the offenders to Boston.

The next incident is told as follows:

> "While the men were at work, the walking delegates entered the building and walked about through it at their pleasure, taking down the workmen's names and asking if they belonged to the union. One of the carpenters replied: 'None of your business.' The next day the delegate met the men when they came to work, and told them a strike had been ordered. Some of the men shed tears and said their families were suffering, but all obeyed. Mr. Haynes next received a visit from the 'Grand Council,' who informed him that their delegates must be respected. After consultation the Council agreed that the man who had insulted their delegate and the rest of the men might go back to work, but the man must by Saturday become a full member of the union. Notwithstanding this, when the men came to work the next morning, the delegate declared that not one should go to work until the man who had insulted him was discharged. The difficulty was finally compromised by the man being given his wages in order that he might immediately go and pay his dues and become a member of the union. It was three days, however, before he could get himself into regular standing, and during this time none of the men were permitted to work."

This was by no means the end of Mr. Haynes's troubles with the walking delegate. He had made a contract with a Boston firm to put in some new marble, and on learning this the delegate for the third time made the men quit work, though, upon Mr. Haynes's assurance that no marble from Boston was actually being laid at that time, they were permitted to resume work. Then Mr. Haynes learned that the delegates were going about among the men collecting one dollar from each for allowing them to work. When the marble from Boston arrived, the delegates refused to allow it to be unloaded, and when Mr. Haynes sought the protection of the police, the delegates called out all the carpenters and painters. Then the representatives of the steam-fitters told Mr. Haynes that he would have to send his engineer back to Boston, and on his refusal the union fitters were made to stop work.

By this time Mr. Haynes decided that he had suffered enough from the tyranny of the walking delegate, and he decided to employ no more men who were the slaves of such delegates. He secured a full force of non-union men, whom he finds better workmen than the union men, and who are not at the beck and call of any loafer who calls himself a walking delegate. From eight to a dozen of these loafers spend the day watching the front and rear of the hotel, and constantly insult and annoy the workers. For doing this each delegate receives from the unions $4.50 a day and his expenses.

We have told this story in detail because it is a typical one, and because it is only from such details that the public can comprehend the intolerable nature of this despotism. It is a patriotic service which Mr. Haynes rendered the community when he raised the standard of revolt. There are signs that the builders and contractors contemplate following his example, as the only way of securing relief from their troubles, and they will deserve no sympathy if they fail to do so.

CONGRESSMAN OATES'S REPORT.

It is refreshing to read an official report on the Homestead affair which tells the truth from beginning to end and is not tinged with demagogism in any part. Such seems to be the character of the report drawn up by Mr. Oates, Chairman of the House Committee appointed to investigate the Homestead trouble. The report contained too much truth to be acceptable to the other members of the Committee; so it seems probable that the Chairman will be in a minority of one. Whether there will be any such thing as a majority report is not yet known. Whether there be such a thing or not, and however widely it may differ from the report of the Chairman, nothing can detract from the force of the latter, or prevent it from carrying the weight which belongs to official deliverances on public questions.

We take notice, first, of Mr. Oates's concluding paragraph, which says that Congress has no power over the questions involved in the Homestead troubles. The phase of the trouble which led to the appointment of this committee was the presence of the Pinkerton men and the conflict which ensued. It was thought by some well-intending people that Congress had jurisdiction over the subject-matter. Mr. Oates tells us that there is nothing in the laws of Pennsylvania to prevent Mr. Frick from employing men from other States to protect the property under his care, although he thinks that it was unwise to do so in the manner and at the time when he did. He ought to have appealed to the Sheriff first, and waited to see what that official would or could do. Mr. Frick took the course which a business man would naturally take. He anticipated that the Sheriff's movements would be sluggish, so he took steps to protect the property in any event. He entered into early negotiations with the Pinkertons, calculating to have the men at Homestead about the time that the Sheriff ought to be there with an adequate force but probably would not be. This, Mr. Oates thinks, was an error of judgment, although not an infraction of law, and here we think Mr. Oates is entirely right. The indignities and outrages perpetrated upon the Pinkerton men, he says, were a disgrace to civilization. It required some moral courage to say this at a time when most people, including the major part of the Senators and Representa-

tives who have said anything about the Pinkertons, were denouncing them as hired assassins, Thugs, and even as traitors to their country. Mr. Oates adds another obvious truth, that if it was lawful for the Pinkerton men to go to Homestead for the purpose of protecting the works, it was unlawful for anybody to oppose their landing, and that all who did so are answerable to the law.

Touching the question of wages, Mr. Oates holds that the company has the right, in equity and good conscience, to a part of the saving effected by improved machinery. By this is meant that rates of wages, when paid on the basis of so much per ton, might be equitably reduced when the amount of labor which enters into a ton is considerably lessened. At the same time he thinks that Mr. Frick's method of dealing with this question was too harsh, and that a more diplomatic course on his part would have led to better results. This is a conclusion at which the public had already arrived, but it is said on the other side that the experience of the company with the leaders of the Amalgamated Association during a series of years had left no other course open than that which was followed. If the case is to be tried before the jury of the whole people, the specific acts of the Amalgamated leaders should be made known. But, of course, the company is under no obligation to submit the case to a town meeting or to an arbitration of any kind.

Finally, Mr. Oates tells the truth about arbitration, saying that the enactment of a satisfactory arbitration law is well-nigh impossible. The reason why it is impossible is, that there is no way to coerce either of the parties. Men cannot be compelled to work if they do not wish to. Employers cannot be compelled to make goods if they find no profit in doing so. The missing link in all arguments for compulsory arbitration is an inexhaustible fund out of which to pay the award of the disinterested tribunal. Give the arbitrators sufficient bread and beef to make good all losses which their verdicts involve, and the difficulty would disappear.

The fact that Congress has nothing to do with affairs of this sort is perhaps the most important announcement in the report. But we do not expect that Mr. Oates's remarks on this head will have any weight with Congress itself, so many members are eager to put themselves in evidence as friends of labor at every outbreak, and so many more are afraid to vote against any investigation which is heralded as being in the interest of labor. Mr. Oates is entitled to the thanks of the community, however, for daring to say the right word.

A TYPICAL PROTECTED INDUSTRY.

THERE are many reasons why the case of the Arlington Mills of Lawrence, Mass., deserves the prominence given it by the recent debate between Senators Vest and Allison. In the first place, Mr. Whitman, the Treasurer of this corporation, has invited the public to give attention to its affairs by causing his statement concerning it to be published in the *Congressional Record*, and by proclaiming that there are not many men in Massachusetts who would question his truthfulness or accuracy. In the second place, Mr. Whitman is understood to be the author of certain paragraphs in the McKinley tariff bill which are believed to have raised the duty upon cotton-warp fabrics manufactured by him from 15 to 30 per cent., or even more; the increase being claimed as a necessary compensation for the duties upon the wool used in these fabrics, but the statute being so worded, through Mr. Whitman's sagacity, as to grant the increased duty also upon the cotton warps. According to our calculations, the duties upon some such dress-goods as Mr. Whitman produces range from 80 to 120 per cent., but this also is a matter which will be better understood when Mr. Whitman makes the further explanation which the circumstances require.

Furthermore, Mr. Whitman, according to the statement printed in the *Record*, has said that the present tariff law ought to be satisfactory to all woollen-manufacturers, as every branch of the industry has been well cared for by it; that every man who clamored for the repeal or modification of this law was inimical to the industry; that he had put all he had into this industry, and that he expected to use all the power of which he was capable to prevent any tinkering with the present tariff. Under these circumstances, Mr. Whitman says, all that he asks is to be let alone. In other words, Mr. Whitman is anxious that the tax with which he is "proud to have been identified," which compels Americans to purchase their dress-goods from him, should not be disturbed, because he is extremely well satisfied with the gains which it enables him to make. We consider, however, that as Congress has been induced to tax the American people in this manner, for this purpose, and with this result, the people are entitled to know what these gains amount to. If there were no other reason for seeking this information, it would be enough that we should at last learn just how much protection a protected manufacturer regards as completely and permanently satisfactory.

After a careful examination of the speeches made in the Senate and of Mr. Whitman's letters and declarations upon the subject, we do not think that he has made out his claim to be regarded as unimpeachably truthful and accurate. Senator Vest, making use of a technically inaccurate expression, said that the Arlington Mills had declared last year a dividend of nearly 50 per cent. Mr. Whitman indignantly replied that this was absolutely false, that the dividend that year was 6 per cent., and that it had rarely exceeded that rate. But it appeared that what Senator Vest meant was not dividend, but balance of profit and loss, and that this had been reported to the State of Massachusetts for the year 1891 as some $932,000, the capital of the corporation being $2,000,000. It also appeared that Mr. Whitman had reported to his directors in 1890 that he had been their treasurer for twenty years, and that the average earnings had been 20.8 per cent. upon the capital. He added that the earnings the last year had been nearly three and one-half times those of the year before, and that the coming year was likely to be the most profitable one in the history of the company. In his last published interview his only reply to Senator Vest's allegation that the Arlington Mills had put $900,000 into their surplus in 1891 was, that the charge was false and malicious. As to the statement concerning average earnings, Mr. Whitman says that Senator Vest inferred from this that the net profits were equal to the sum named, whereas every business man knows that earnings and net profits are different things.

It can scarcely be denied that the impression naturally derived from Mr. Whitman's language is that the Arlington Mills put no such sum as $900,000 into their surplus in 1891, and that the net profits of the stockholders have been little more than 6 per cent. Indeed, he points out that these mills paid no dividend until 1877, eleven years after their organization, and that the average dividend since then has been between 6 and 7 per cent. It does not seem to us that a man who had stated to the stockholders that the average earnings of their mills were 20.8 per cent. is quite frank or accurate in giving the public the impression that these stockholders had received dividends of but 6 or 7 per cent. during little more than half the time that the mills had been in operation. Mr. Whitman says that in 1869 the stockholders paid into the treasury of the mills a sum equal to the whole amount of its capital stock, $240,000, to make it good. It seems that the capital stock is now $2,000,000. We understand that in 1886 it was $1,000,000. Does Mr. Whitman wish the public to get the impression that the present capital stock represents the amount of cash paid in by the stockholders? If this is not the case, we think that a man who prides himself upon his reputation for truthfulness and accuracy should explain to the public what part of his capital and surplus consists of accumulated earnings, and what percentage of the capital paid in in money these accumulated earnings represent.

Mr. Whitman also, in the letter in which he denounces Senator Vest's statements as false, says: "There has been no strike at the Arlington Mills of recent date," and no cut-down in wages since the passage of the McKinley Law. It seems that at the end of last March the Boston *Herald* reported a strike at the Arlington Mills. The *American*, a Republican sheet published at Lawrence, spoke at the same time of "another strike" as occurring at

these mills. We have no space to go into the details of these strikes, which are reported by these papers to have been caused by reductions in wages, and one of which seems to have occasioned the interposition of the State Board of Arbitration, and to have been followed by the discharge of a number of workmen. We admit that the accounts of these strikes, printed at the time in the Boston and Lawrence papers, were probably exaggerated, as such accounts usually are. But when Mr. Whitman alleges that no strike has taken place at the Arlington mills of recent date, and appeals to his reputation for truthfulness and accuracy to confirm his statement, we are obliged to say that, considering the statements which we have here reviewed, we find it less credible that two newspapers should have minutely described events which never occurred, than that Mr. Whitman should have failed to be strictly truthful or strictly accurate.

COAL WASTE IN PENNSYLVANIA.

MAUCH CHUNK, July 23, 1892.

A FEW days' systematic driving through the anthracite region of Eastern Pennsylvania gives one a vivid and oppressive sense of the reckless waste with which the present generation is using up the reserve stores of coal that have so long awaited the advent of man in this desolate region. The river is black with dust; unsightly heaps of coal-waste vie with the mountains themselves in magnitude all over the area, while preparations are in progress on every hand to increase the output of the mines already opened, and to open others whence the greatest product can be obtained with least expense. If anything can be more desolate than a deserted coal village, it is a coal village that is not deserted, where everything is black with dirt, where the children of tender years seem to revel in it, and where children of larger growth join their mothers in spending the long hours of the day in picking over the waste heaps and carrying the saved lumps of coal to the nearest merchant to barter for the necessaries of life. Much as one is shocked with the labor of women and children in connection with the coal mines of Belgium, he will be even more so in some places in Pennsylvania.

The philosophical problems forced upon one's attention by the waste of coal in Eastern Pennsylvania are staggering, whether he try to reconcile it with the benevolence of the Creator, or whether he attempt to prescribe a proper course of human conduct with respect to it. First and foremost is the fact that it is not man, but Nature herself, who has been most regardless of the waste. Without question the coal deposits originally covered the whole area from Blue Ridge to the bituminous coal-fields of the western part of the State. But the crumpling up of the earth's crust which elevated the region above the sea, occurred so long before the beginning of the modern era of civilization, or even the advent of man upon the earth, that ninety-nine-one-hundredths of all the original deposits in the central and eastern parts of the State have been removed by the slow but ceaseless activity of Nature's erosive agencies.

All the anthracite coal of the State (which is nearly all in the world) is now that contained in scattered areas in the eastern part, amounting to two or three hundred square miles. These areas are in several long synclinal or trough-like basins which constituted the bottoms of the folds into which the crust of the earth was pressed by the forces that elevated the Appalachian Mountains. The upper, or anticlinal, portions of the folds have disappeared, with all the wealth of stored-up energy which was originally upon their sides and summits. In repeated instances the unreflecting tourist, in an hour's ride on the cars, passes across the base of an anticlinal arch of carboniferous age which formerly rose higher than the Alps, but which now is so completely worn away that its place is occupied by a depression. In general, where were once the mountains we now find the valleys, while the bottoms of the ancient valleys are the mountains of to-day. Such has been the wastefulness of Nature. The problem presented is insoluble.

Nor does the apparently necessary wastefulness of man offer a much easier solution. At the present time the most improved processes of mining do not save one-half the amount contained in the areas mined, and these processes are from 15 to 20 per cent. more economical than those of ten years ago. It is not alone the vast heaps of mingled slack and comminuted shale so disfiguring to the coal regions which constitute this waste, but to a considerable extent it is the pillars of anthracite which have to be left in the mines to prevent the roof from falling in upon the workmen. In both these forms of waste, however, it is possible for the optimistic theorist to see blessings for the future. More thrifty and economical generations than the present may glean in these fields, and live for centuries upon that which this generation could not afford to obtain. As the women and children eke out a tolerable livelihood by picking over the waste heaps of the past decade, so in a more systematic way coming generations may extract like good from the discarded waste of the present time. A less hopeful view is to be taken of the inevitable wastefulness of present modes of combustion, in which far more heat goes up the chimney than is converted into economic uses. But human nature is such that it is useless in the present stage of the world to urge any marked reform in this respect, for the general impression seems to be that there is an inexhaustible store of coal at our command, or that, if coal fails, something else will be discovered to take its place. At any rate the day of evil to the human race appears so far distant that present economy for the sake of problematical good to posterity cannot be made to seem an urgent duty. Many are, however, waking up to the fact that the problem is nearer at hand and more urgent than anybody had heretofore supposed. When one sits by one of the great arteries of the coal traffic, as I now do, and hears and sees on two rival roads the almost endless trains of loaded cars pass by in one direction, and the ceaseless procession of empty ones return, he gets a new sense of the figures which express the rate at which our supply of coal is being depleted.

The growth of modern civilization is coördinate with the consumption of coal. At the present time no other source of power which man utilizes is to be compared with it. To our coal mines we resort for more than nine-tenths of all the power which runs our factories, propels our steamers and railroad trains, and furnishes our stores of electricity. Gen. Wistar estimates that if all the water fall in Pennsylvania was utilized with a head of 150 feet, it would not furnish one-tenth the power now derived from steam in the State. Following the example of calculations made in England a year ago, of which I gave an account in these columns, the same authority has endeavored to get an approximate estimate of the date at which our own coal fields will be exhausted. The result is almost as startling with reference to America as that with reference to Great Britain. At the present rate of increase of consumption the English coal supply will begin to fail, and its use become economically unprofitable, in about half a century. In America the evil day can apparently be delayed only about a century and a half, or perhaps three centuries. Any greater delay than that would involve such a check in our industrial development as to amount almost to a catastrophe.

At the present time the civilized nations are in a condition of industrial and commercial exuberance resting on a basis much resembling that of the lately popular endowment societies during the first few years of their existence. The consumption of coal in the United States was twice as great in 1890 as it was in 1880. Such is the capacity of modern mechanical and industrial machinery that this use is likely to increase in geometrical ratio until nearly the time of the total exhaustion of the coal fields. Still, there is no occasion to despair of the future of the race. Necessity is the mother of invention. Localities may lose their relative importance. The star of empire may pass from the great coal-producing countries to the arid regions of the earth, where concentrated rays of sunshine may be made to drive the busy wheels of industry, or to the regions where the trade winds or the tides now waste their energies in unproductive labor; but, in learning the economy which will eventually be necessary, the world will perhaps have opportunity to develop a higher order of virtues than now seems possible amid the fresh discoveries of so many of Nature's reserved stores.

Perhaps also we were wrong in saying that Nature's waste of coal presents an insoluble problem, for in one other respect also there is an apparent compensation both in Nature's wastefulness of the coal deposits and in man's. Gen. Wistar does, indeed, after careful calculations, forebode evil to present forms of animal life in the vast addition to the stores of carbonic-acid gas consequent upon the present rapid consumption of coal. He estimates that when the coal is all consumed, the atmosphere will be so laden with this poisonous product that only such unwieldy animals as characterized the Mesozoic period can flourish in it. But from this gloomy presentiment we are relieved by that benevolent wastefulness of Nature which has removed the larger part of the original coal deposit from our reach. The vast quantities of carbon which have been carried into the depths of the sea by erosive agencies have so mingled with the ooze at the bottom that there is no probability that it will ever be resurrected to add to the pollution of the atmosphere by combustion. In this there has been a comprehensible and positive gain to man in the apparent wastefulness of Nature. Having cleared the atmosphere once, both her own waste of the product and that of man combine to prohibit subsequent pollution. The purity of the atmosphere is at any rate secure. G. FREDERICK WRIGHT.

WITH BERNHEIM AT NANCY.

NANCY, June, 1892.

ACCORDING to the Nancy view, there is nothing abnormal about the hypnotic sleep. It

is normal sleep artificially produced, and the method of producing sleep artificially—suggestion—is nothing more than a skilful and professional use of the hitherto unrecognized fact that our normal life is full of responses suggested to us by our surroundings. Of our usual surroundings, persons are the most important elements; in other words, our social environment, our living *milieu*, gives constant tone and support to our lives and aids our development. The much-talked-of fact that hystero-epileptic patients are most hypnotizable, simply means that they are most suggestible, because of their characteristic neuroses; but all men are suggestible, nevertheless, and the difference is one of degree.

On this theory the passes, rubs, magnets, etc., of the Paris school become so much machinery, merely, of suggestion—concrete signs to the patient of what is expected of him; and he goes to sleep, wakes, passes from stage to stage, etc., because it is suggested, not because he is rubbed or magnetized. When the Paris men find a certain physical touch or rub necessary to induce a given phenomenon, it is simply because they have themselves taught the patient to wait for that particuiar signal; for this reason the "signals" are in reality a part of the hypnotic manifestation in those patients who have been thus brought up. This view, it is evident, requires support from the ordinary facts of the reactive consciousness, and it is to the exhibition of them, to the exhibition of the analogies afforded by phenomena of imitation, natural somnambulism, contagion of opinions, etc., that the books of Bernheim are in part devoted. And in establishing this point, a contribution of the first importance has been made to psychological theory, whether we accept suggestion as an adequate theory of hypnotism or not. We are but now beginning to understand the profound meaning which may be imported into the expressions, "environment," "social tissue," "solidarity," etc., hitherto employed with partial understanding of this meaning. The lamented Guyau must have been right in claiming that suggestion was to be one of the corner-stones of our reconstructed theory of primary education.

But, true as this is, the Nancy men seem to run into two extremes. To bring normal mental reactions and hypnotic reactions under the same formula, they deny some of the most characteristic aspects of each. "Will?" says Dr. Bernheim. "What is will? There is no such thing as will—it is all suggestion!" Now, analytical psychology means something very definite by volition. "Trance? There is no such thing as hypnotic trance—it is sleep, normal sleep." But who has been able to put a normal sleeper through the performances of the commonest hypnotic somnambules? True, there are sleep-walkers in many homes; but it may be a truer interpretation to say that they are no longer normal sleepers. No doubt great service has been rendered by the Nancy men in showing the artificiality of the Paris categories; but the true explanation of hypnotic sleep is probably yet to be advanced, just as a true explanation of natural sleep is yet to be advanced.

The patients in the hospital at Nancy seem to illustrate Dr. Bernheim's theory. They go off quietly into a deep, lethargic sleep. Somnambulism is comparatively rare, being developed by suggestions of walking, etc. Bernheim's manner is imperative and authoritative to the last degree. His first and last word to a patient is, "Dors, dors absolument!" He generally closes the eyes with his hand, then doubles up the patient's fists and starts them to revolving round each other in front of the patient's face, the whole arm being actively engaged in this circular movement. As soon as the movement lags, he seizes the fists and starts them again vigorously, at intervals straightening out the arms quickly to test their tendency to catalepsy. If the patient opens the eyes, or shows any signs of persistent wakefulness under this treatment, it is repeated more vigorously, accompanied by vocal expostulations and commands. Nearly everybody succumbs! It must be added, also, that Bernheim now claims to be able to carry normal sleepers over into the hypnotic state without waking them up.

The question of "criminal suggestion" is at present uppermost at Nancy. Prof. Liégeois of the department of law, formerly known as a political economist, has studied the legal aspects of hypnotism and written several important papers. In a recent article on criminal suggestion in the *Revue Philosophique*, he insists upon the reality of the phenomenon, and points out its great danger to society and the State. He finds that some somnambules—a relatively small number—are liable to a so-called "second state," in which criminal suggestions take certain and immediate effect. By this hypothesis, which rests upon frequently reported experiments in the hospitals, he explains several cases of crime committed, as he believes, under influence—cases which have agitated French society and nonplussed the legal profession. For example, he analyzes and explains the famous Bompard case. He promises in another article to explain in the same way several other criminal cases which have remained mysteries in the records of the courts. Liégeois proposes, in view of the facts, that a hypnotic official be appointed before whom all children shall be brought. If a child be found relatively unsuggestible, well and good. But if liable to hypnotic suggestion, the official's business should be to suggest that no one else, as long as the child should live, should be able to hypnotize him. This suggestion would take effect, and the child would then be free from all such influences in the future.

On the other hand, many deny the possibility of criminal suggestion altogether. While not disputing the reported cases in which the somnambule does under command what would ordinarily be criminal, they claim that he knows all the time that the performance is a sham. He not only gets the suggestion, consciously given, of the act, but he also gets the suggestion, unintended by the operator, that in this case he is playing a part with others in a farce. When we consider the enormous exaltation of the faculties shown by many somnambules, and reflect that just such an hypothesis of subconscious suggestion is one of our last resorts in explaining a great number of facts which look like thought-transferrence, we begin to see the reasonableness of this position. It is argued with force by Delbœuf in a recent issue of the same review.

Yet there are one or two senses in which it is clear the phrase "criminal suggestion" cannot be used. It is about demonstrated that there are no post-hypnotic criminal suggestions—that is, suggestions made to the patient of criminal acts to be performed after he has been restored to his normal life. Suggestions of acts which are morally colorless may be post-hypnotically realized; but when a suggestion has moral coloring, the patient may deliberate upon it in quite a normal way and resist it. Again, it must not be understood that the patient becomes a criminal or that his moral nature is even temporarily debased when under the influence of a criminal suggestion. On either of the hypotheses mentioned above, this is not the case. The question is, Does he perform the act knowing that it is not really a criminal act, and consenting because he knows it, or does he perform it as an automaton would, because he is temporarily a non-moral machine? In view of the conflicting evidence now before us, and the probability of new light in the near future, it is just as well to suspend judgment on this important question.

The Nancy men have a very practical test to propose, one which offers an heroic opportunity to an enthusiastic experimenter. A man of straw was put to bed, in one of the experiments, and a somnambule, in a highly suggestible state, was told to go stealthily from an adjoining room and stab his friend, the occupant of the bed, using a knife then put into his hand. We are told that he took the knife, that his face became dark and angry, and that, with stealthy tread and soft, he sneaked into his friend's bedroom, and stabbed the man of straw. Now, say the *savants* of Nancy, if any one in Paris does not believe this, let him come and take the place of the man of straw! As yet no one has accepted the challenge. The reason of their backwardness, as one of those concerned in Paris intimated to me, may be that they know how cordially they are hated in Nancy, and are well aware that if any one should play the man of straw, his professional friends in that city would take great pains to see that the somnambule understood his business!

The wards of the Nancy hospital present a very remarkable appearance since the introduction of hypnotism as a therapeutic agent. Bernheim and his assistants and students, perhaps fifteen or twenty, go through the halls inquiring after this patient and that, putting this one to sleep in order to banish a pain from his head, leg, or side, commanding a semi-paralytic to use his limbs, working hard to overcome the resistance of a new-comer. Here sits a girl with arms akimbo, left for a period in a cataleptic state; there stands a sluggish somnambule; and further on the voice of the master is heard urging a reply from a man who is not conscious enough to frame one. Then he goes to his private reception room, where new cases are brought in. A mother brings her child with pains in the feet, an old man comes with a crick in his back, headaches in endless variety abound, and coughs *ad infinitum*. Each patient is questioned carefully, then told to sit and remove hat or bonnet. Remonstrances are vain. Eyes are closed, fists set to turning, and in all the noise of come and go, question and answer, one by one they fall aleep. Then the proper suggestion is made to each one: "Your head is well," "Your back shall never ache again," "Your legs are as sound as mine," iterated and reiterated. Then they are awakened. Do their pains persist? Then they must go over again, *nolens volens*, into another sleep. When they leave, they say they are cured, and Bernheim believes they tell the truth; but on grounds stronger, certainly, than their word alone or the fact that they do not return to the hospital.

Indeed, the therapeutic value of hypnotism is believed in at Nancy as nowhere else, perhaps. The English translation of Bernheim's 'Suggestive Therapeutics' is, of course, well known in America. Patients are taken just as they come from the city streets into the hospital and thrown, as a matter of course, into the hypnotic trance. Some of the reported cases

of cure are certainly remarkable enough—if they are cures! The Nancy physicians ought to know. Yet elsewhere doctors remain sceptical. Perhaps it is true that their scepticism renders their own efforts less successful; for in this mysterious realm, more than elsewhere, it seems to be faith that removes mountains. Perhaps others cannot cure because they do not know how. Be this as it may, let the Nancy cures go on; and if they finally demonstrate the difference between scientific caution and professional prejudice—demonstrate, further, the primary influence of the moral over the physical—demonstrate, finally, that moral environment is the tremendous thing, that force of character and influence is in some way relative to active belief, and that reality is in great measure what we choose and will with all our might—then the physicians will no doubt join the psychologists in saying, Amen!

J. Mark Baldwin.

LETTERS OF IPPOLITO PINDEMONTE.

Italy, June 25, 1892.

"Felice te che il regno ampio dei venti,
Ippolito, a' tuoi verdi anni correva."

sang Foscolo to Pindemonte anent his long sojourn in England, France, and Germany during the eventful years that closed the eighteenth century. During this tour the brilliant young Veronese wrote constantly to his friend the Contessa Isabella Teotochi Albrizzi, who was enamoured of *la belle France* and of all that related to the people with whom her nature sympathized more than with the Italian. The Italian cities through which he passes, even his native Verona, do not furnish him with any very interesting topics, but as soon as he touches Geneva he is enchanted. "Though the city is not particularly beautiful, the neighborhood and the lake are superb. Lately I made a tour in the mountains of Savoy; there and on the Lake of Geneva Nature has shown all that she can unite of the beautiful, the terrible, and graceful. You know how natural scenery moves me. I am always hungry for the country when mewed up in cities, and can never have enough of fresh air, trees, mountains, and green fields." But the balls and the French opera enchant him equally, and the society in which he mixes is of the pleasantest, as he meets "many persons of distinguished merit, and the general culture is above mediocrity." He begs Isabella to tell him of her amusements, of her health, and of her studies, and especially of all that is happening in Venice.

Pindemonte arrived in Paris in the spring of 1789, just as the famished multitude in all the cities (not only in *les bonnes villes*) and in the country districts had elected the members of the États-Généraux. He was present on "the great day," the 4th of May, when the 1,200 deputies, the King, Queen, Court, after listening to the "Veni Creator" in Notre Dame, went in procession "with all Paris" to Saint Louis; Mirabeau present, Sieyès absent. The Assembly opened, no longer in the King's château, but in the immense Salle des Menus. The speeches of the King and of Necker dwelt entirely on the virtues and the abnegation of the superior classes who had so nobly consented to share their privileges with the "lower orders." The King and the nobles retaining their hats, the third estate uncovered, on which the King, to prevent "these airs," took off his own hat also.

"The events that are happening in Paris are worthy of imitation by other nations. I shall always congratulate myself on being present at the opening of the Assembly. It will be difficult ever again to witness a spectacle which, for the aim in view and the form, should prove as grand, interesting, and beautiful. It is true we have revolts, rebellions, killed and wounded; but all these are minor matters, say the politicians, if we succeed in gaining a constitution, which half France maintains does not exist."

Pindemonte remains in Paris throughout July and August, and to his friend who writes alarmed for his safety, he answers:

"I am very grateful for your anxiety, but really the situation here is not so critical for us as the Englishman who hurried from Paris to Venice has led you to believe. His own fears have exaggerated the circumstances. I can't say that a sojourn in Paris at the present moment is void of peril—many visitors have fled; but curiosity, and the delight of witnessing a great revolution in a great country, are such powerful incentives to remain that I have not once thought of quitting the city. At present no more heads are being cut off. Of course all is in confusion, but this is inevitable when the old order is destroyed and the new régime not yet established. Chaos is terrible but indispensable when a Government is to be utterly changed. If the new constitution be not *ottima*, it will be the fault of the Assembly, which is now omnipotent, seeing that the King has no control over it. I do not write more as I suppose you will read the news in the *Gazette*, or learn all particulars from your friends, which is the method that best pleases you if I mistake not. Towards the end of the month I leave for London."

And from London Pindemonte writes on the 4th of September. He "has arrived safely despite the malefactors who now infest France." Londoners are all in the country, and he goes there also, expecting to enjoy himself, "even without the spectacle of a revolution. You will, though you don't read the newspapers, have heard of all the horrible scenes in France; but probably you do not know that the spectators who enjoyed them most were of your own sex." Of course he chooses the most fashionable resort, and his next letter is dated:

"Bath, October 4, 1789.

"I write to you from one of the most beautiful and at this season one of the gayest cities in Europe. People come here in numbers to take the baths and drink the waters, but the majority come for the gayeties which abound here, and I am, thanks be to heaven, among these. Balls are among the most popular amusements, and you will hardly believe the good figure that I cut in the throng. Alas, to dance a minuette well is not the same thing as winning a battle, and to shine in a contredance not the same as giving a good constitution to France. Apropos of France, does it not seem to you that your French people are most unjustly accused? True it is that they have displayed great ferocity, but any other people whatsoever would in similar circumstances have shown equal ferocity; the want of bread and the fear of famine renders the gentlest populations furious. Now that the French King, to save his civil list and pensions, has sacrificed his silver buckles, peace and calm seem to be restored to Paris. The destinies of France depend now on the Assembly. No obstacles can arise save in its bosom. Should it succeed in establishing a wise Government, no praise will be too great. You know that the English nation only during the course of many centuries and by dint of long struggles secured the liberties which they now enjoy, nor have they shown much wisdom or prudence throughout the many circumstances that have led to the situation in which they now find themselves. France, on the contrary, has made her great journey in a single step."

Pindemonte remained nearly a year in England—"sufficient time," writes Foscolo, "to become familiar with her literature. Some of his poems dedicated to Englishmen who became his friends, prove the enthusiastic admiration which this illustrious Italian felt for their country." English parks were his delight, and the beautiful cemeteries inspired a poem which Foscolo quotes with praise.

"My health is excellent," he writes to Isabella in April, 1790; "the climate and methods of English life suit me admirably. I have collected some English books. Gray I long since owned. It is in my little library at Venice, and is at your service if you mean to continue your study of the English language. Many of your friends will dissuade you, but perhaps this is a reason to persevere. Gray has not written much, but all that he has composed is excellent. After the 'Elegy,' his poem entitled 'The Bard' pleases me best. The subject treats of a tradition that Edward the First, after his conquest of Wales, ordered all poets to be killed because their songs excited the people to rebellion. Gray supposes that one of these bards or singers beholds from the summit of a mountain Edward's army marching in the plain, and, seeing the massacre of his countrymen, poetically curses the tyrant and predicts the misfortunes that will befall him and his descendants. The bard then flings himself into the sea. The argument, as you see, is a fine and grand one, and the treatment is worthy of the subject. As to Richardson, I am sorry to tell you that he is not so much esteemed by the English as in my opinion he ought to be. Perhaps he is less read because he treats of manners and customs that have passed away in great part, but he represents human nature which exists always. I don't know whether you have read a novel by Miss Burney, called 'Cecilia.' Here you have the England of to-day faithfully depicted."

In November he writes from Vienna, where he does not seem "at home" as in England:

"Most just are your words about Alfieri, and if you come to know him intimately, you will become ever more his admirer because you will better understand the gifts which adorn his writings. I know no such lover of the right, such an enemy of all that has the least taint of injustice. Then how docile he is, though he knows his own powers; delicate and graceful qualities unite in his heart with strong and virile virtues. His two Brutuses also seem to me greater than on the first reading. No other writer who has treated the same subject, has placed in such strong and clear relief the insuperable necessity of the one to kill his adoptive father, of the other to cause his children to be killed. 'The hand that trembled so it could not wound' (Act V. of 'Brutus the Second'): what a new and marvellous inspiration!"

France attracts Pindemonte again, and he next writes from Marseilles—

"*bien jolie* and the port superb. The country is tranquil on the whole. It seems to me that the provinces are much more aristocratic than Paris. . . . I find a great difference between the culture of the provinces and of the capital; this is more of a commercial than a literary city. True, there is here an Academy of Sciences, but the members are dispersed on account of the troubled times, justifying the proverb, 'Timid as a philosopher.' The Abbé Raynal is here, and is worth a whole academy; but he is very old and begins to *radoter*. I see him often, though, because the *radotage* of such as he is better than the wisdom of most. Were it not for fear of wearying you, I should tell you of Avignon and Vaucluse, and of Petrarch, whom I seem to see there always; and of Nîmes and her superb antiquities. What a delightful sensation it is to come from the North to the South, and to find spring and almost summer in October. At Munich such leaves as were still on the trees were yellow and dead, but as you come South all is green and bright and living."

In June, 1793, he writes: "I fear that we shall have *your* Frenchmen in Italy if the Emperor does not send reinforcements, and if the English fleet tarries." From Florence in 1795 he writes of Alfieri:

"He is in good health; is not writing anything, but studying the classics, Greek and Latin, as if he were beginning his education. Singular man! the greatest genius that I have ever known. . . . You wish him to write a poem, but do you think that the creative faculty is exhaustless? Nineteen tragedies and

many other things not yet published, are not these likely to have exhausted even his productive faculties, at least in part? I wish you were here to see his tragedies performed. Yesterday 'Saul' was given, and you would have been converted, as was Zacco, who denies, however, that it is a tragedy. I do not speak of the effect it produced on me only, but on the whole audience, though the actors were poor. 'Saul' is the favorite tragedy of the Florentines."

Pindemonte seems always travelling, and the Countess is often on the wing, so that the letters, which extend over thirty years, are extremely interesting, giving a picture of the famous men of the time, of their literary works, of the success and failure of these; but it is remarkable how little interest the poet takes in the politics of the time: of the fate of the kingdom of Italy, of the cession of Venice to Austria, he seems to take little note.

"You are out of spirits," he writes in 1797, 11 Vendemmiale, from Venice. "First of all, war is not decided on—on the contrary, the chances seem for peace. But let us suppose that war breaks out: from a political point of view I see no reason to regret it, as the consequences (not the immediate and transitory, but the permanent and decisive) will be beneficial to us. From a humanitarian point of view, tell me what difference there is between 50,000 individuals whom you do not know killed in Friuli and Carinthia, and the numberless Romans who perished centuries ago on the battlefields of Pharsalia and Philippi? Did you ever write pathetic letters to any Ippolito for those Romans? You have seen some 800 sick, and the sight has perturbed you; but if you had remained in Venice, you would not have seen them. And why should I flee from Venice because I hear of disasters beyond the Brenta? You say that this is no time for writing tragedies, and this you say because you know that the tragedy which I am now composing causes the time to pass as swiftly as when I pass it with you.

"Still, your letter is welcome for the tidings that you mean to pass the winter in Venice. Your delineation of the character of Cervoni is true to life. It is not true that you are losing your sight; your eyes penetrate to the depths of men at first sight. Salute the brave and virtuous general for me. Gianni is working at his poem, but the liberty which is to beatify Italy is still on the Alps, whence he beholds its rays illuminating Rome, penetrating the sepulchres, and awakening Cicero, who sends back an oration to liberty. Does the idea please you? will it please Franceschini? Adieu, my beautiful and amiable Isabella. Keep yourself beautiful, amiable, and the friend of PINDEMONTE."

In 1805: "I did not send you from Verona the plan of Bonaparte's route because I thought that the motives which aroused your curiosity no longer existed. Here it is: Cremona, Brescia, the camp, Mantua, Modena, Bologna, Parma. He will reach this city [Verona], not on Saturday, as was announced, but on Sunday. In his speech to the Legislature which I have just read in the papers, he says that he hopes to preserve peace on the Continent. But he privately assured the Minister Felici that he feared war to be inevitable." In this letter, without even a fresh paragraph, he continues: "If you were enchanted with Mme. de Staël, she was no less so with you. She arrived here Monday morning, and at once wrote a courteous note asking me to visit her directly, as she could remain only a few hours. I went and found her at dinner; she begged me to accompany her to the amphitheatre in her carriage, whence she started for Brescia. She wished to visit my apartment, and found my physiognomy, I fancy, very different from the portrait in my works."

Foscolo comes in for some kindly criticism; at the same time Pindemonte tells Isabella that she is prejudiced "on account of his disapproval of the French poets and of Delille especially;" that Foscolo thinks well of her 'Portraits of Celebrated Men,' barring certain errors of diction which Pindemonte had already corrected. For this expression of opinion Foscolo is reproached by Isabella, who seems to have been much spoiled by her various admirers. Later, Pindemonte says: "I am afraid Foscolo is vexed with me, as he has not written to me again. I have finished my 'Answer' to his 'Sepulchres,' but it needs much correction, and I have been much perturbed while composing it. You will be surprised that I have not yet read Monti's letter. These are not the brightest days of my life, and I grow indifferent to many things that used to interest me." But his joviality soon returns in the midst of his family of sisters and brothers, nephews and nieces, to whom he seems most sincerely attached.

The death of Alfieri stirs the philosopher. He follows eagerly all the signs of posthumous fame; tells Isabella that the mausoleum sent from Rome to Florence is to be placed in Santa Croce between the monuments of Galileo and Michelangelo, that the Countess of Albany receives half of the pension which the English Government paid to the Cardinal of York. The edition of Alfieri's works by Rosini will be magnificent: first are to come the published, then the unpublished poems; but Pindemonte expects greater things from Bettinelli's biography.

Of Canova there is frequent mention: "Landi the painter says that his works are each one greater than the last. I can hardly hope that Canova will come to Verona," he writes in 1810. "He will go to Ferrara, to Bologna, and to Florence. How noble and grand is his intention to erect that temple in his native city. I felt my soul soar and expand when I read that in your letter." He begs her not to frank her letters because they are rather heavier than usual. "I am richer than I need be, especially after the pension from the Institute, which was conferred on me quite spontaneously. I am working steadily on the 'Odyssey,' and striving for exactitude, keeping ever in mind that in original compositions one is responsible only for one's own errors, but in translating one becomes responsible for one's own, and also for those which we cause our authors to make. I am reading conscientiously Lambert's observations on the 'Iliad'—this as a Homerist."

Foscolo, in his essays on Italian literature, published first in England, writes:

"There are several versions of this poem [the 'Odyssey'] in Italian, but none have obtained that fortunate and complete success which the favorable vote of the *letterati* of a nation can alone insure. Probably Pindemonte preferred this second Homeric poem to the 'Iliad,' conscious that the characteristics of his style are not such as to render the energetic, imaginative, picturesque majesty which that divine poem holds. The first two cantos of the 'Odyssey' were published some time since, and Italy, delighted with the poetic attempt, impatiently awaited the whole, which has just appeared. The time that has elapsed is too brief for it to be seen what is the judgment of the *letterati* on its merits."

Pindemonte's 'Odyssey' went through four editions in his lifetime, and is still reprinted in the popular editions of the day.

In February, 1814, he writes: "The scene is changed. Yesterday, a little before noon, the Austrians entered Verona, and communications are reopened with Padua." And on the 1st of May: "To-day the consecration of the new King of France takes place at Rheims. The Emperor of Austria will return on the 15th. You will know what happened to Napoleon and his family. The Prince [Eugene Beauharnais] and the Princess are to leave Milan also to-day. It seems that no Italian save Assalini will accompany them to Munich." Often he dilates on the *finesse* of the Italian language. After saying that he "sospira" not for Paris, but for the Calle delle Ballotte in Venice, he adds: "Note that *sospirare*, which is the *regretter* of the French, though they say we have no equivalent for it, whereas we have another also, which is *piangere*. Here are both in two verses of Tasso's:

"'*Piangiti* riposi di quest' umil vita,
E *sospirai* la mia perduta pace.'

Excuse the pedantry." In several letters he defends Lord Elgin for despoiling Greece of her marbles, saying that the Parthenon is going to ruin, and that in England they will be cared for; much to the disgust of Isabella, who, however, entertains the despoiler, as he is a celebrity.

Pindemonte takes up warmly the question then raging over Count Ugolino, not yet settled by the faculty:

"Niccolini has expounded a new opinion anent the canto. He insists that Ugolino ate up his children, and founds his belief in this fine act on Dante's line—

"'Poscia, più che il dolor, potè il digiuno.'

"Prof. Carmignani is of the same opinion, but another professor in the same University has arisen to confute them, and rightly too, in my opinion. I speak of Rosini. You can hardly believe the ferment in Tuscany caused by this controversy. I fear that Gargallo will enter the lists, and I say fear because I have reason to believe that he will not take the right side. . . . Rosini writes joyfully of the discovery made at Rome of an edition of Dante annotated by Tasso, and adds with infinite satisfaction that the publication of this treasure will be his last typographical labor. A new expositor of Dante has arisen in Piacenza: a grand assembly, a great crowd, great admiration. One would think that in Italy one had never heard of Dante before."

Again:

"Carmignani has republished his letter. He declares that there is at Pisa a very ancient picture in which Count Ugolino is depicted with a long beard hovering over the corpses of his sons in the act of devouring one already half unfleshed. For me this proves nothing. I hope that Gargallo will print nothing."

Nothing seems to us more surprising than that such a controversy should ever have arisen. Dante finds Ugolino with his teeth fixed in the nape of his arch-enemy. Archbishop Ruggieri, and promises that if he can prove reason for such atrocious vengeance he will do him justice in the upper world. And the still anguished father tells his harrowing story—how his four sons died one after the other in six days of hunger; how he for other three days hung over them, calling on them by name though dead; then, fasting more than sorrow killed him also.

Throughout 1827 and the first nine months of 1828 the letters continue in the same bright, vivid tone. The last letter, written in his own bold, clear handwriting, is from Verona on the 20th of October, 1828, and is one of the best, treating of certain pictures of Raphael which Toschi of Pavia is engraving; reminding Isabella that last year at this time he was with her in the city "che nel tranquillo mare curva si specchia"—his own description of Venice, "mirrored while bending o'er the tranquil sea." But on the 10th of November of the same year comes a letter in the handwriting of Lorenzo, his servant, dictated from Verona: "The slight fever which always promises to go never really abandons me, but let us hope for the best. Benassù is ill also;

but I hope to see him to-morrow, as he is much better. I know nothing exactly about Casa Pompei. Lorenzo, my valet, reveres you. Remember me affectionately to Giuseppino. Addio!"

It was the last adieu. The "perfect and worthy gentleman" died within that month of November, 1828. J. W. M.

Correspondence.

LINTON'S VINDICATION OF PAINE.

To the Editor of The Nation:

Sir: In a review in the *Nation* some weeks ago of Mr. Conway's 'Life of Paine,' that book was spoken of as *the first serious defence of Paine*. I have not the exact words before me now, as I did not at the time feel called upon to notice a mistake scarcely concerning any one but myself. However, this week the mistake is repeated in the *Tribune*; and as it may go the round of the press, I would ask to be allowed to correct it where it first occurred.

More than fifty years ago, in 1840, I published in London a 'Life of Paine,' defending him from the then current calumnies since so continually repeated. I say nothing of any merit in my work, a book of fifty-four pages of 250 words, except that it was in earnest, and that it plainly, and with authority of personal friends of Paine then known to me, fully, particularly, and very distinctly met all the charges against him.

Fifty-two years ago may well account for the book being forgotten, and I know it has been long out of print; but for ten years at least it had a considerable sale, going through several editions. I only state so much, caring not to lose here in America the honor of having been the first so publicly to do justice to the character of Thomas Paine. W. J. Linton.

New Haven, Conn., August 6, 1892.

UNSECTARIAN THEOLOGY.

To the Editor of The Nation:

Sir: An editorial paragraph in your issue of July 28 calls attention to the establishment of a non-sectarian School of Theology at Boulder, Colorado, as a "novelty worth attention." All that you say of it might with equal truth have been said of the Harvard Divinity School at any time within the past dozen years. This school was reorganized on a non-sectarian basis as long ago as 1879. At that time it made an appeal to its friends for a new endowment, with the express understanding not only that it should impose no denominational tests upon either instructors or students, for this it had long ceased to do, but that it should distinctly disregard the precedent which it had until then followed of looking usually to the Unitarian denomination for its professors, and should seek them wherever the best men were to be found. The money asked for was given within a few months upon this understanding. The first appointment made under the new endowment was that of a Baptist scholar. The next appointment was that of a Unitarian clergyman, and two others following soon after were, one of a Baptist clergyman, the other of a Unitarian layman, whose previous training had not been in the line of theology. The first vacancy was filled by one of the most distinguished scholars of the Orthodox Congregational denomination. During this period of twelve years, lecturers have been drawn from every shade of religious opinion. The only limitation upon absolute denominational indifference has been that all parties have agreed that the form of theology known as "Unitarian" shall always find a hearing in the school, and this is really not a limitation, but rather a pledge of liberality. The school will welcome the foundation of chairs of theology by any body which is willing that its students should have the same teaching of Hebrew, Greek, Church History, Ethics, the History of Religions, and the Philosophy of Religion that is now given to the students of the school. The fact that such chairs are not founded is only one of many which go to show beyond a doubt that the sectarian spirit, far from being, as you suggest, in decay, is actually governing professional theological instruction in this country.

Non-sectarian instruction in theology in Cambridge is no longer an experiment. It has been in practice long enough for results to show themselves. The Divinity School, with a largely increased and greatly strengthened Faculty, which works in the closest relations with the general life of the University, has just about maintained its numbers. It has not become a popular resort for students of denominations having theological schools of their own. Even its graduate department, in which growth has been more marked, has not one-tenth of the students that ought to be attracted by the great advantages of a final year at Cambridge, and by the instruction given in subjects not generally touched upon in other theological schools. There is abundant evidence to show that this result comes from two causes—first, the *odium theologicum*, and, second, the fact that the school has distinctly set its face against the indiscriminate pauperizing of students which unhappily prevails in so many theological seminaries.

Ephraim Emerton.

Cambridge August 4, 1892.

POLITICAL PURITY IN THE STATE OF WASHINGTON.

To the Editor of The Nation:

Sir: There are sundry events in the political life of our newer States which show a wonderful tendency in our younger politicians to eliminate the decalogue from politics as Ingalls once advised them to do.

I think a few of the many illustrations in this State would be of interest to your readers. During the recent county conventions I do not recall a single Federal officer who did not take part in the wire-pulling. In Yakima County, for instance, among the delegates were the Indian Agent and his employee, the Register and Receiver of the U. S. Land Office, the Postmaster in the leading post-office, etc. When it is remembered that the local land officers occupy positions of a judicial nature, further comment is unnecessary. But perhaps the most disgraceful example of the spoils system is to be found in Thurston County, where the friends of a candidate for the Supreme Court insisted on the convention appointing a committee to wait on him and obtain a list of the delegates whom he desired to have sent to the State Convention. The candidate returned his list, and they were selected by the Convention. When we remember that he was at the time on the Superior bench, that his leading supporters "pointed with pride" to this as an indication of "strength," and that no adverse criticism has yet appeared, ought we to be surprised that so many admired Hill's snap convention?

The effect of all this is as degrading to our political life as one would expect. It is well known that some of our Superior judges formed combinations with attorneys to secure their positions, and thus give us a living example of the blessings New York enjoyed under Boss Tweed. I am informed on unquestionable authority that an attorney in the central part of the State boasts to his clients that he owns the judge, and two-thirds of the community believe him, yet they are apparently willing to allow him to continue the ownership. Men who are reasonable and honest in most things show a wonderful disinclination to credit any man with a sincere desire to obtain better officers. If one says Federal officers ought to be removed for going into politics, he is a theorist or a crank. Mugwump means hypocrite, or one who changes politics for personal ends, and in its Eastern sense is entirely unknown here. Citizen.

Seattle, Wash., August 2, 1892

EDMUND L. STEWARDSON.

To the Editor of The Nation:

Sir: The death of the young sculptor, Mr. Edmund L. Stewardson, who was drowned on the 3d of July, while sailing at Newport, is a misfortune to American art. That he was so little known is natural, since he did not live to be twenty-eight; it is more significant that he was known so much, and that the work his brief years accomplished had already earned the high esteem and expectations of every artist who saw it.

Mr. Stewardson was a Philadelphian, and began his serious studies in the Life Class at the Academy of Fine Arts, which he entered in February, 1882. He was then seventeen. There were no good chances to learn modelling, but he profited instantly by the admirable teaching of Mr. Eakins in the treatment of muscular action, and developed a power to give the muscles a coherent play throughout any figure, which is a thing seldom mastered except by mature workers. In this young beginner it astonished the instructors at the Paris École des Beaux-Arts, where Mr. Stewardson presented himself for examination in the autumn of 1887. He passed first among seventy-two competitors, French, English, German, and of all countries. This brilliant beginning brought him at once into notice, and during 1888 he was selected by M. Chapu to work with him. In 1889 his nude figure "La Baigneuse" won a mention in the Salon. The excellence of this study got Mr. Stewardson his admission to the Society of American Artists. He was the youngest member ever elected.

In 1890 he started his studio in Philadelphia. During the two remaining years, he worked with ardent industry. Besides many studies, he completed four portrait busts. For two of these he had no live model, and studied from death-masks and photographs — discouraging and unfavorable conditions. Yet as likenesses these busts satisfied the families, while artists were struck with their singular skill and strength. During this last year Mr. Stewardson's merit was becoming recognized. The distinction of his talent, and his just and competent taste, had made an impression even on Philadelphia; and for the coming year he had been appointed to instruct both at the University and at the Academy of Fine Arts. The men in Paris were watching Mr. Stewardson's career, and have been quick to express their distress at his untimely loss. But it will be sufficient to quote Mr. St. Gaudens, who has said: "I was impressed not only by his skill,

but by his personality. My opinion of him both as a sculptor and as a man was such that, had I taken the decorative sculpture on the buildings of the Exposition at Chicago, I had selected Mr. Stewardson to have charge of it all. Without question he would have been a leading sculptor—he was such already among the younger men." O. W.

PHILADELPHIA, August 5, 1892.

Notes.

Two illustrated books by Dr. Charles C. Abbott are announced—'Recent Rambles,' in the press of J. B. Lippincott Co.; and 'Recent Archæological Explorations in the Valley of the Delaware,' to be published by Ginn & Co.

D. Appleton & Co., also, have in preparation a book of outdoor life, 'In Gold and Silver,' by George H. Ellwanger, with illustrations by W. H. Gibson, A. B. Wenzel, and W. C. Greenough, in two editions—one "de luxe."

The first volume of an illustrated edition of Green's 'Short History of the English People' will soon be published by Harper & Bros. Several colored plates will reinforce the wood-engravings, and the portrait-gallery will be large.

S. C. Griggs & Co. have nearly ready 'England and its Rulers,' by H. Pomeroy Brewster and George H. Humphrey, and 'Eclectic Shorthand Phrase-book,' by J. G. Cross.

'German Orthography and Phonology,' by Prof. George Hempl of the University of Michigan, is shortly to be issued by Ginn & Co., who set down for the autumn 'Fourier's Series, and Spherical, Cylindrical and Ellipsoidal Harmonics,' with an introductory treatise by Prof. Byerly of Harvard.

D. C. Heath & Co. will soon publish 'The Bible and English Prose Style,' by Prof. Albert S. Cook of Yale.

A Life of Sir Henry Sumner Maine is promised in the autumn by John Murray, as well as an abridgment of the memoir of Jenny Lind.

Cánovas & Traynor, 3 Calle de Santa Catalina, Madrid, invite subscriptions to a reproduction of the first geographical chart of America (1500), by Juan de la Cosa, Columbus's sailing-master in his first and second voyages. It will be a facsimile at scale, and in the original colors, from which black, by the way, is absent. The price for the popular edition, on satin paper, is twelve shillings. There will also be editions on parchment, hand-colored (£20), and on vellum (£1).

The 'History of Education,' by Prof. Painter of Roanoke College, Va., has been translated and published in Japanese. The same author has ready for publication a 'History of English Literature.'

The Appletons have just brought out a third, revised edition of Mr. Louis Heilprin's 'Historical Reference Book,' which is quite the most compact, convenient, accurate, and authoritative work of the kind in the language. It is a happy combination of history, biography, and geography, and should find a place in every family library, as well as at the elbow of every scholar and writer. The "Chronological Table of Universal History," year by year, has been extended from May, 1886, to May, 1892, and has also been overhauled from 1883. The "Chronological Dictionary of Universal History" has received numerous additions, sometimes at the expense of a trivial omission, like the capture of Arica by Chili. The "Biographical Dictionary" has kept up with the death-roll, and in the case of ex-President Grévy the birthdate is explicitly corrected, adding six years to his life. There are also probably several insertions, but De Amicis is the only one we chance to have remarked. The typography remains ideally good for such a manual.

Roberts Bros. continue their charming edition of Jane Austen's novels with 'Emma' in two volumes, with the customary etched frontispiece vignette to each. And now comes a formidable rival in a dainty English edition devised by J. M. Dent & Co. (New York: Macmillan). The elegant typography is somewhat more condensed, and the volumes are consequently lighter to the hand than in the American edition. The photogravures, after designs by William Cubit Cooke, are more numerous; and in the opening work ('Sense and Sensibility') the frontispiece is from an interesting portrait of Miss Austen at the age of fifteen. The text followed is that of the last editions revised by the author, and the original order of publication is observed. 'Lady Susan' will be omitted. A sketch of Miss Austen prefaces the work before us. Finally, the binding is tasteful in the extreme.

In the latest issue of the Peacock novels, 'Gryll Grange' (Macmillan), the editor owns to some falling off in the author, but he confines it to quantity, and thinks that in quality the book is, within its limits, "as good as any that ever came from Peacock's pen." Ethically he regards it as an advance, and he especially recommends it to the man of letters over its companions because "in none of them is there so much agreeable and instructive talk about books." The novel is published in two volumes.

'The Best Letters of Charles Lamb,' edited with an introduction by Edward Gilpin Johnson (Chicago: A. C. McClurg & Co.), represents very fairly Lamb's qualities as a letter-writer,' and also conveys necessarily much information about himself and his friends. What was lacking in the way of autobiography is amply supplied by the editor. The little volume makes a very good shelf-companion to Elia, only it should have an index.

The first volume of Henry Craik's 'Swift: Selections from his Works' (Macmillan) is abundantly provided with editorial helps, in the shape of a Life of unusual excellence on both the historical and literary sides, and in addition brief introductions to each body of selections, and very full and minute notes explaining the mass of contemporary incident, character, and allusion. The first volume covers only the period to 1712, and includes specimens of the early poetry of Swift, the 'Tale of a Tub,' and the Journal to Stella, besides other pieces. The arrangement, however, is not chronological in detail. The volume is solid, containing nearly 380 pages of text. Two volumes of these dimensions and edited in this way should provide quite enough acquaintance with Swift for any except the specialist; but it is rather to older students that such an author appeals. Though a text-book, and carefully made decent, it is not for boys and girls.

A volume that is for boys and girls may be found in 'Select Essays of Addison, together with Macaulay's Essay on Addison's Life and Writings,' edited by Samuel Thurber (Boston: Allyn & Bacon). The preface descants on the teaching of literature, and the notes illustrate a new method, new, at least, in degree. Instead of explaining various simple matters, the scholar's attention is called to the need of his finding out for himself what is wanted, and some hints are given as to what volumes he had better consult, usually books that ought to be at hand in a well-equipped high school. This certainly has the advantage of teaching the scholars something at least of method, and accustoming them to use books collectively. The selections from Addison are unexceptionable; but in the excellent reference to authorities on the period Forster's essay on Steele, replying to Macaulay's studied depreciation, should not have been neglected.

The second volume of Dr. K. A. Schmid's 'Geschichte der Erziehung vom Anfang an bis auf unsere Zeit' (Stuttgart: Cotta), in the preparation of which the editor is aided by "a number of scholars and schoolmen," has just appeared. It is a large octavo of more than a thousand pages, divided into two parts, the first of which begins with a chapter on "Christian Education in its relation to Judaism and to the Ancient World," by the late Prof. Gustav Baur of Leipzig, who is also the author of the final chapter, on "Jewish and Mohammedan Education." The second chapter, on "Education in the Middle Ages," by Prof. Hermann Masius, treats of cloistral and elementary schools, as they then existed, and is supplemented by a chapter on "Mediæval Universities," in which Prof. Otto Kaemmel gives an admirable account of the origin and organization of those institutions, the subjects taught, the methods of instruction, the life and character of the students, and the results of the training they received. The second part of the second volume sketches the history of education in the age of humanism, and the influence of the Reformation as shown in the principal Protestant Universities. We may add that the first volume, published in 1884, was a comprehensive study of education before the Christian era, and that the third volume, which is to be issued before the close of the present year, will be devoted to education in modern times.

M. J. Chailley-Bert patriotically admires the colonizing aptitude of his fellow-countrymen, especially as exhibited in Tonquin, but he has come to the conclusion that the ill success of the French as colonists is due to their lack of foresight and their habit of imposing their laws and ways upon the natives. He has therefore written, under the title 'La Colonisation de l'Indo-Chine: l'Expérience Anglaise' (Paris: Armand Colin & Cie.), a study of British methods of colonization and government of conquered Eastern lands. He has selected Hong Kong and Burmah as striking examples, and from the history of these two colonies draws lessons of practical importance which he begs the French people and Government alike to lay to heart.

An edition of Alphonse Daudet's 'L'Obstacle' (B. Westermann & Co.), brought out in the thoroughly artistic style of the Paris house of Flammarion, will please readers by its appearance. The piece itself is in four acts, and turns upon the question of hereditary madness. It is not a strong work, and does not display very much of Daudet's unquestionable talent.

The lithographers are as unwilling as the etchers to be copyists only, if we may judge by the formation in Paris of a society of "Peintres-Lithographes," on the lines of the painter-etchers' association. They announce a quarterly album of ten plates by ten different lithographers. Among the contributors to the first number are M. Jules Cheret and M. A. Willette. The price of the forty annual plates will be 240 francs. The Paris publisher is M. E. Sagot (New York: F. W. Christern).

The principal article in the July Proceedings of the Royal Geographical Society is a description of various journeys in Sierra Leone, by G. H. Garrett. The most important of these was a mission to the Almadi, the ruler of a Mohammedan kingdom on the Upper Niger. This man, who is better known as Samory, was formerly a slave, but has gained his present position by his ability, aided by a reputation as a prophet. His career of conquest, recently checked by the French, is marked by an almost unexampled destruction. Mr. Garrett travelled "four hundred miles through a destroyed country, not a single town or village left, the whole way strewn with bodies in every stage of decomposition to bleached skeletons." Samory's army consists of both horse and foot, and exhibits a remarkable order and discipline. The Mendis, one of the interior tribes, is ruled by a "secret politico-religious society," known as the "Porroh," into which the natives are initiated after a novitiate of from one to four weeks, being tattooed and receiving a new name. "Wars are arranged and stopped, heirs to chiefdom approved or disapproved, and laws generally are made, by the Porroh." The Government has some resemblance to the old feudal system, and trial by ordeal is common.

We are gradually being brought nearer the makers of the much discussed "bird tracks" of the Connecticut River Valley. In "Notes on Triassic Dinosauria," in the *American Journal of Science* for June, 1892, Prof. Marsh of the United States Geological Survey figures and describes portions of the skeletons of three recent and suggestive discoveries. The skull of *Anchisaurus colurus* might at first sight be taken for that of a bird if it were not for the teeth, thirty-six or more in each set. The bones were thin-walled and light. The fore foot had three digits functional in walking, the fifth being rudimentary and the fourth too short. The hind foot also had the fifth digit rudimentary, while the first was so short that the foot would make, as Prof. Marsh says, a three-toed track very much like the supposed bird-tracks of the Connecticut River sandstones.

Fanny D. Bergen contributes to the *Journal of American Folk-Lore* for April-June a useful group of popular American plant-names, by way of encouraging this branch of dialect and folk-lore. Of a certain fungus called "death-baby," she notes that as it is fabled to foretell death in the family, she has "known of intelligent people [in Salem, Mass.] rushing out in terror and beating down a colony of these as soon as they appeared in the yard." There are several excellent papers on superstitions and proverbs in Virginia, Baltimore, North Carolina, and Arkansas, furnishing numerous parallels, as in the injunction to put the roof on a building "when the little moon hangs down, so the shingles won't turn up." Indian myths and usages receive their usual attention. The editor, in a book review, disputes the tradition of Miss Eliza Quincy's mother feeding with a snake out of a bowl of bread and milk, and restraining its greed by taps on the head with her spoon. He thinks that Mrs. Quincy honestly appropriated to herself a snake legend known in France and in Germany.

The centenary of the witchcraft delusion at Salem, Mass., lends especial interest to a "Genealogy of the Nurse Family for Five Generations" in *Putnam's Monthly Historical Magazine* for July. A frontispiece shows the house of Rebecca Nurse at Danvers. A monument to this good woman, bearing the names of her neighbors who courageously if vainly testified to her character, has just been erected over her grave.

We read in the July number of the *New England Historical and Genealogical Register* that Mr. Sidney Perley of Salem has begun the arrangement of the genealogy of every person who lived in Essex County, Mass., before 1800. In the same number it is noticeable that Mr. Waters's "Genealogical Gleanings in England" are placed at the very end, for convenience. This instalment possesses quite the average interest, and has much to tell of the connection of the Wards of Ipswich, among others. It is preceded by a valuable table of the will-registers of the Prerogative Court of Canterbury, prepared by Mr. J. C. C. Smith, of the Probate Registry, Somerset House, London. We may also mention a paper by Mr. Andrew McFarland Davis on the "Exhibitions of Harvard College prior to 1800," being an antiquarian research into gifts and bequests for scholarship during that period of which the founders' names have been more or less obscured by a merging of the exhibition accounts. Women figure largely in the list, and the very first gift, £100, was made by Lady Ann Mowlson of London, in 1643.

A properly managed Congress of scientific men from all parts of the world, convened to present and consider investigations in specific lines of research, cannot fail to exert an important influence on the progress of science, whether pure or applied. As part of the World's Congress Auxiliary of the Columbian Exposition, the general Committee on Mathematics and Astronomy, of which Prof. G. W. Hough is Chairman, has issued a preliminary address inviting the coöperation of all persons and societies interested in these departments of physical science, and bringing the general subject of the Congress to the notice of scientific men everywhere. In particular are advice and suggestions sought with reference to the questions to be discussed. The Committee have divided their large field into (1) Pure Mathematics, in which the main sections are arithmetic and theory of numbers, analysis, and mathematical physics; (2) Astronomy, with sections embracing the history of astronomy, astronomical instruments, methods of observation, physical astronomy, and observatory buildings; and (3) Astrophysics, to include spectrum analysis, astronomical photography, and stellar photometry. An Advisory Council has been appointed, with the chief mathematicians and astronomers of the world as members, who will make recommendations of themes to be discussed by the Congress; and the entire movement ought to bring about a closer and more effective international coördination in scientific work than can be said to obtain at present.

—The *Academy* of July 16 published the list of pensions granted during the last year and charged upon the English Civil List. Among those granted on account of scholarship or literary eminence, we note one of £100 a year to the widow of the late Mr. E. A. Freeman, the historian; one of £25 a year to each of the three daughters of the late Rev. F. H. A. Scrivener, "in consideration of the eminence of their father as a Biblical scholar, and of their inadequate means of support"; and one of £50 to the widow of Mr. G. H. Bettany. Mr. Edward Walford receives a pension of £100; Dr. George Gore one of £150; Mr. H. D. Macleod one of £100—all for services rendered to science or literature. Mr. Henry Bradley's admirable work on the 'New English Dictionary' is recognized by a pension of £150. Most people will hear with surprise of the £40 granted to Mrs. Mary Gray Garden, "in consideration of the literary merits of her father, the late James Hogg." The Ettrick Shepherd died fifty-seven years ago, and that a daughter of his is still alive is an unexpected revelation. There are seventeen pensions in all, and their amount is £1,200. Two things are noteworthy in the list: the meagreness of the amounts granted, and the painful addendum that comes back like a refrain at the end of almost every one of the announcements—"in consideration of inadequate means of support." However, the disclosures recently made in the case of Miss A. B. Edwards and her pension may show that the phrase is only a conventional formula.

—'Notes for the Nile,' by H. D. Rawnsley (London: W. Heinemann), is the work of an enthusiastic lover of ancient Egyptian art and literature. The first part contains an account of the methods of the construction and decoration of the tombs, together with the burial ceremonials. This is followed by a description of Mr. Flinders Petrie's work at the Medum Pyramid, showing in a fresh and interesting way the manner in which excavations are now carried on. A chapter upon the great Pharaoh tells in a graphic manner the story of the recent discovery and removal of the royal mummies from their desert tomb to Bulak. This removal, according to Brugsch Bey, who superintended it, was accompanied by a most striking demonstration of grief by the natives. "There arose from all the land of Egypt 'an exceeding bitter cry,' and women wailing and tearing their hair, men casting dust above their heads, came crowding from the villages to the banks to make lamentation for Pharaoh," as the flotilla bearing the bodies passed down the stream. Mr. Rawnsley has also brought together in a readable form the main facts in the life of Seti I., the father of the Pharaoh of the bondage of Israel. The second half of the volume contains some metrical translations of ancient Egyptian hymns, including a portion of the heroic poem of Pentaur and the 'Precepts' of Ptah-hotep. The teachings of this latter book, the oldest in the world, since it was written in the century preceding, 3266 B. C., are marked by simplicity and directness, as well as by their humanity, as the following extract shows: "If thou become great after thou hast been little; if thou hast become rich after thou hast been poor, when thou art at the head of the city, know well how to use the position that thou hast gained. Harden not thy heart because of thy rank; remember that thou art become only the steward of the good things of God. Put not behind thee thy neighbor who is as thou once wast. Treat him as an equal." Among the pictures of the native life of the present day drawn by Mr. Rawnsley, the pleasantest is that of the workpeople of Mr. Petrie, who, without the stimulus of either whip or overseer, work with zeal, industry, and honesty. This leads the author to plead urgently for the abolition of the kurbash, with which in every other part of Egypt the natives are still driven to their work.

—If there were any occasion to doubt the activity and effectiveness of the younger generation of American astronomers in dealing with current problems affecting the future of their science, it would speedily be removed by examination of any such "Account of the Progress of Astronomy" as that now published biennially in the Smithsonian Report, and compiled by Mr. William C. Winlock, an assistant to Prof. Langley, and himself one of the

younger workers who have attained a reputation worth having. To take, for example, the last issue of this periodical paper, which has recently appeared in separate form, perhaps the most significant and far-reaching work of the period in question is that relating to the motions of planetary nebulæ toward or from the earth, by Prof. Keeler, who has lately left the Lick Observatory to become the Director at Allegheny, Pennsylvania. Not only were the nebular movements in space made a subject of careful determination, but the character and position of the brightest line in the nebular spectrum were thoroughly investigated under most favorable conditions of atmosphere and instruments. One of these latter was a Rowland diffraction grating with 14,438 lines to the inch. Whoever has been fascinated by the meteoritic theory of Lockyer will find in Keeler's work a rather harsh damper of his ardor; for in no one of the nebulæ observed has the critical line been found coincident with the fluting of magnesium, as Lockyer maintained, but the signal observations of Dr. Huggins have met with the fullest confirmation, and the chief nebular line has at no time and under no circumstances appeared anything like a fluting.

—Prof. Barnard, still remaining upon the staff of the Lick Observatory, is hardly less well known, and his enthusiastic labors have received frequent comment in these columns; and a third young member of that staff, Prof. Schaeberle, has achieved much distinction more recently by his contributions to solar theories, and to eclipse research as well. This latter, calling for expeditions not infrequently to remote parts, has formed an attractive field which the younger astronomers of America have not been slow to harvest—Pickering employing important modifications of spectroscopic appliances in California; Todd inventing and using in Africa a novel method of operating any number of photographic instruments as a mechanical automaton; and Bigelow, assistant astronomer on this latter expedition, developing to a satisfactory conclusion a form of portable telescope which promises much for the future. But this note must be concluded with briefest mention of a half score of other names—some of them very prominently known, and all of them recognized in scientific circles the world over, because of their work: Chandler, whose researches upon variable stars are unsurpassed; Boss, whose standard star-places are authority in every observatory and upon every survey; Elkin, the precision of whose stellar distances ranks his work with that of the great Bessel; Crew and Hale, who are manifesting remarkable ability in solar studies; Payne and Wilson, engaged upon miscellaneous astronomical problems, Comstock and Porter upon star positions and the investigation of astronomical constants; the younger Hall, determining anew the mass of the planet Saturn; Sanford, making important researches into the psychology of personal equation; Very and Hutchins, attacking with marked success the intricate questions which are presented by the lunar radiations; while the activities of many others whose names do not occur at this moment are scarcely less worthy of mention. All told, there seems in America to be a distinct growth in astronomical interest unexcelled elsewhere, except, perhaps, among the French.

SYBEL'S GERMAN EMPIRE.—I.

The Founding of the German Empire by William I. By Heinrich von Sybel. Translated by Marshall Livingston Perrin, Ph.D., of Boston University, assisted by Gamaliel Bradford, jr. Vols. III., IV., V. New York: T. Y. Crowell & Co. 1891-'92.

In Von Sybel's second volume Bismarck was inducted into the premiership of Prussia, and began to smooth the way for the struggle with Austria. By the aid rendered to Russia during the Polish insurrection, he strengthened the dynastic sympathy already existing between that country and his own; and he gratified the French Emperor and initiated better relations with France by a commercial treaty which considerably lowered the duties levied by the German Customs Union.

In his third volume the historian describes the united diplomatic action of Prussia and Austria against the German Confederation on the one hand and Denmark on the other, and their joint conduct of the Danish war. The treaty of peace left the allies in possession of Schleswig-Holstein, but in their joint tenancy lay the germs of discord and conflict in the near future. In his fourth volume the author traces the growth of the quarrel down to the outbreak of the Austro-Prussian war, and in the fifth he describes that war and the formation of the North German Confederation. The third and fifth volumes are largely occupied with the military movements of 1864 and 1866. This part of the history, often recounted in official reports and in the writings of military experts, we pass over, remarking merely that Von Sybel's narrative is always clear and interesting. The real contribution to historic knowledge made by these three volumes is the detailed account, from the Prussian and other archives, of the Prussian and European diplomacy of the years 1864 to 1866 inclusive.

The complicated Schleswig-Holstein question has never, we think, been treated with equal lucidity. It is interesting to note that the historian achieves clearness of statement by insisting on the same distinction which underlies the diplomacy of the statesman—the distinction of the constitutional question in Schleswig-Holstein from the dynastic question. The almost unanimous demand of the German people (supported at the time by Von Sybel himself) was that the dynastic question should be placed in the foreground. Holstein and Schleswig were to be separated from Denmark by compelling Denmark and Europe to recognize the Augustenburg claimant as rightful proprietor of the duchies. Bismarck, however, insisted on postponing the dynastic question, and conducted the diplomatic campaign on the constitutional issue—on the claim that the duchies had constitutional rights guaranteed by European treaties which Denmark was violating. It is easy to see now how much wiser this policy was than that advocated by the Prussian Diet and the German people. The dynastic question was not absolutely clear; the constitutional claim hardly admitted of dispute. On the dynastic issue the hands of Prussia were tied by the London treaties of 1852, to which she was a party, and which had set aside the Augustenburg claims. On the constitutional issue Prussia had the best of rights to interfere actively, for in the treaties of 1852 Denmark had promised Austria and Prussia that Schleswig should not be incorporated in the Danish State, but should remain autonomous. Denmark was now trying to incorporate Schleswig; she had issued a common constitution for Denmark and Schleswig. This was a violation of her treaty obligations, and Austria and Prussia had a clear right to force her to observe those obligations.

Of course they had the alternative right of declaring that their assent to the exclusion of the Augustenburg claimant had been invalidated by Denmark's failure to keep her promises. In the treaties of 1852 those promises had been expressly declared to be the ground of that assent. In legal phrase, Austria and Prussia had the right either to demand specific performance or to rescind the whole contract. Had they elected the latter course, they would have been free to recognize Frederick of Augustenburg as Duke of Schleswig-Holstein. But they would then have had no right to make war upon Denmark for the purpose of installing Duke Frederick in Schleswig. Acting as German powers and through the German Diet, they could establish him in Holstein, but in Schleswig the German Confederation had no authority. The invasion of Schleswig in behalf of the Augustenburger, had it been attempted, would have been without color of right, and all Europe would have been arrayed on the side of Denmark. The result would probably have been the permanent incorporation of Schleswig in Denmark; and this, as Von Sybel shows, was the result which the dominant party in Denmark, the "Eider-Danes," desired. They were willing to let Holstein go in order really to secure Schleswig.

It was objected at the time that the course of action pursued by Bismarck would result in the reëstablishment of the personal union of both duchies with Denmark. This was, in fact, what Austria and nearly all German conservatives desired. The liberation of the duchies, attempted in 1848, was associated with the national and revolutionary ideas of tha period, and was therefore abhorrent to all good Tories. It was supposed that Bismarck shared these views. But Bismarck, as we now know, neither desired the reëstablishment of the personal union, nor did he anticipate it. War once declared, he saw that the prize of victory would be whatever the victors chose to make it. But he could not well say this, for such a declaration would have frightened Austria out of the alliance and would have consolidated European sentiment against Prussia. By recognizing, for the time, the personal authority of Christian IX. in the duchies, and by restricting Prussia's initial demands to the reëstablishment of Schleswig's autonomy, he carried Austria with him and disarmed the jealousy of Europe. The condemnation which was showered upon him by the diets of Prussia and other German States, and by popular meetings all over Germany, was ingeniously turned to account and made to serve his policy. "See," said Bismarck (in effect) to Austria and to the other Powers, "how revolutionary is the demand of the German people. They desire, in defiance of the European treaties of 1852, to separate Schleswig-Holstein entirely from Denmark. We, on the other hand, take our stand on those treaties and seek simply their enforcement. If you resist our just and moderate demands, we must retire from the conduct of affairs, and ministers in sympathy with the popular desire must take our places." Alarmed by such a prospect, Austria joined forces with Prussia, and Europe endeavored to persuade Denmark to grant the Austro-Prussian demands. But this, as Bismarck foresaw, Denmark could not do. King Christian, indeed, wished to withdraw the Constitution which had been proclaimed for Denmark and Schleswig; but the Eider-Danish Ministry, backed by the sentiment of Copenhagen, refused its coöperation, and the King found it impossible to form a Conservative Cabinet. So it came to war, and

the result of the war was such as Bismarck had hoped from the outset.

Through all the preliminary negotiations, as we now learn, Bismarck avoided committing Prussia in any definitive manner to the personal union of the duchies with Denmark. He recognized this as the existing legal status, but he refused to bind Prussia to the maintenance of this status after hostilities should have begun. In January, 1864, when the treaty of alliance between Prussia and Austria was still under discussion, Austria proposed that no other solution of the question than the personal union should be adopted, save by agreement of both the allies. Bismarck amended this clause so as to make it read that the future position of the duchies should be determined only by agreement between the allies. The difference was very important: the Austrian draft would have enabled Austria to hold Prussia to the personal union, while Bismarck's draft gave Prussia the right to veto the personal union. The Austrian Ministers did not fail to appreciate the distinction, but they were by this time so far committed to the Prussian alliance, and so apprehensive of Bismarck's retirement and the appointment of a radical cabinet in Berlin, that they accepted the amended reading. Later in the same month England, France, and Russia tried to obtain from the allies a pledge of Denmark's territorial integrity. Austria wished to give the pledge, but Bismarck refused.

After the first victories of the allies and during the first negotiations for peace at London, Prussia agreed with Austria that the personal union, with proper guarantees for the autonomy of the duchies, was "to be preferred"; but the Danes, as Bismarck expected, refused to discuss this arrangement. From that moment the personal union disappeared entirely from the Prussian programme, and Bismarck refused to consider any solution except the complete separation of Holstein and at least the major part of Schleswig from Denmark. The further victories of the allies and the quiescence of Europe brought Denmark to terms, and in the treaty of peace Schleswig-Holstein and the little duchy of Lauenburg were ceded to Austria and Prussia. The question was then, of course, what should the allies do with the duchies? Austria, carried far beyond her original programme by the course of events and the astute diplomacy of the Prussian premier, fell back upon the candidacy of Duke Frederick of Augustenburg. She had originally opposed his claims, identified as they were with the national and revolutionary impulses of the German people; but the organization of Schleswig-Holstein as an independent State was now the only alternative to the annexation of the duchies by Prussia, and the Augustenburger was almost universally regarded as the rightful Duke. This was a solution which Bismarck did not desire—he was not inclined to erect a new principality in North Germany; but he did not refuse to discuss the proposition. He demanded for Prussia, however, certain naval and military rights in Schleswig-Holstein. Prussia, he declared, was entitled to some advantages in return for her expenditures of blood and treasure; and the duchies, left to themselves, were not strong enough to resist Denmark. Without disputing these assertions, Austria intimated that Duke Frederick should first be recognized and that negotiations should then be opened with him. Bismarck preferred to have the negotiations precede the recognition. An informal interview with the Duke showed him to be quite disinclined to make the concessions which Prussia desired. In the meantime a change of ministry took place in Vienna, and the new Cabinet, while admitting that Prussia might reasonably claim certain privileges in the duchies, protested against her demands as excessive. Schleswig-Holstein, thus "protected," would not be an independent State.

In the spring of 1865 the relations between the allies were seriously strained. Again, as in the early stages of the Schleswig-Holstein complication, Bismarck carefully studied the European situation. Napoleon was anxious to embroil Prussia and Austria, and hinted at an alliance with the former Power. Bismarck did not desire the French alliance, for French support could be recompensed only by the sacrifice of German interests. With Italy, however, an alliance could easily be arranged without the abandonment of any German territory. All that was necessary was to promise her Venice. Napoleon seemed favorably disposed towards such an alliance. At a full Cabinet meeting in Berlin, May 29, 1865, Bismarck and Moltke gave their voices for the annexation of Schleswig-Holstein and war with Austria. But King William decided to adhere for the time to the demand for a Prussian protectorate over the duchies. This being still refused, the Augustenburg candidacy disappeared from the Prussian list of possibilities as completely as the idea of the personal union with Denmark had previously disappeared. An official opinion of the Prussian Crown jurists, in June, 1865, denied the validity of Duke Frederick's claims. His father had renounced his rights and taken money for the renunciation; King Christian IX. had been the rightful Duke of Schleswig and Holstein until he ceded them to Austria and Prussia; nobody had now any rights of sovereignty in the duchies except these two Powers. Fortified by this legal opinion, King William called upon the Emperor Francis Joseph to coöperate with him in expelling the Augustenburger from the duchies. No satisfactory answer was received and war seemed inevitable. But another change of ministry took place in Vienna, and the quarrel was patched up by the treaty of Gastein. According to Von Sybel, Bismarck was at the moment less sure than he liked of the attitude of Italy and France, while the Austrian Ministers found the army and treasury in such a condition that they shrank from an immediate war. The terms of the treaty are well known. Prussia and Austria agreed to divide the administration of the duchies, Austria holding Holstein and Prussia Schleswig. Prussia also obtained Lauenburg outright, for a money consideration, and the control of the harbor of Kiel. But the great advantage which Prussia registered at Gastein was the practical repudiation by Austria of the Augustenburg claims, and her tacit recognition of the correctness of the Prussian position—that nobody but Austria and Prussia had any rights in the duchies.

The separate administration, however, occasioned no less friction than the joint administration. The arrangement was felt on both sides to be provisional, and Austria soon returned to the Augustenburg candidacy as the most desirable settlement of the question. The encouragement given by Austria to the Augustenburg party aroused increasing bitterness in Berlin; and when, at last, Austria submitted the Schleswig-Holstein question to the Confederate Diet, Bismarck declared the treaty of Gastein broken and Prussian troops were sent into Holstein. This, in his view, was merely the reëstablishment of the joint administration; but Austria pronounced it an act of war. The Austrian representative in the Confederate Diet moved the mobilization of the Confederate troops against Prussia; and, this motion being carried by a majority vote, Prussia declared the Confederation dissolved.

Before the outbreak of the war, Prussia had secured the alliance of Italy and assurances of French neutrality. The negotiations which led to this result constitute a singularly tangled web of intrigue. After the conclusion of the treaty of Gastein, La Marmora suggested to Austria the sale of Venice to Italy and an alliance against Prussia. The fruits of victory were to be, for Italy, the Italian Tyrol, and for Austria, Silesia. At about the same time Bismarck offered to buy out Austria's interest in Schleswig-Holstein. These proposals were offensive to the pride of the Imperial State, and they were both rejected. Italy, with the authorization of Napoleon, then turned to Prussia; and, after much haggling, due to the suspicious temper of the Italian negotiators, an offensive and defensive alliance was concluded, April 8, 1866, which was to hold good only in case hostilities should begin within three months. Austria, getting wind of this treaty, offered Venice to Napoleon, April 26, in return for French and Italian neutrality. Napoleon inquired (not for the first time) what Prussia would pay for French neutrality, but obtained no definite answer. Bismarck, informed of the offer of Austria to abandon Venice, and uncertain of the attitude of France, considered, for a moment, the possibility of a reconciliation with Austria. It was very late for such an attempt, for Austria, Italy, and Prussia were all mobilizing at full speed. But certain ingenious proposals for a settlement were made by one Gablenz, a Prussian subject himself, but with influential Austrian connections, his brother being a general in the Austrian service. Gablenz's suggestions were: (1) Schleswig-Holstein to constitute an independent State under a Prussian prince; (2) Prussia to receive the harbor of Kiel and to pay Austria five million thalers; (3) Schleswig-Holstein to pay Austria twenty million thalers for her expenses in liberating the duchies; (4) the military control of Germany to be divided between Prussia and Austria, Prussia commanding all the troops of North Germany and Austria those of South Germany. It seems, according to Von Sybel, that these proposals recommended themselves to Bismarck, and that Gablenz was authorized to see what he could do in Vienna. Here also his plan appears to have met with some favor; but the Austrian Ministers, impelled to war by internal troubles and impending bankruptcy, decided that it was too late to think of a peaceful settlement.

During these months (April and May, 1866) Napoleon and his Cabinet, playing to some extent at cross-purposes with each other, were negotiating simultaneously with Prussia, Austria, and Italy; and the attitude assumed by France, judged even by the lax canons of international morality, verged upon perfidy. The alliance between Prussia and Italy had been concluded not only with the knowledge but with the approval of Napoleon. His old sympathies for Italy and his vague enthusiasm for the "principle of nationality" led him to welcome a combination which would carry the unification of Italy a step further, and which might lead to a more compact organization of North Germany. Personally he seems to have believed that the friendship of Germany was worth more to France than territorial gains coupled with rancor. But such a policy did

not recommend itself to the French people or to his own Ministers. They demanded tangible advantages for France in compensation for the disadvantage entailed by the strengthening of her neighbors. Prussia, though often sounded, would promise nothing definite. Bismarck sheltered himself behind his King; he himself was "more Prussian than German," but King William would not agree to the cession of a foot of German territory. Napoleon admitted that the attitude of the King was an honorable one, but authorized his Minister of Foreign Affairs to negotiate with Austria. According to Von Sybel, an arrangement was concluded by which, in the event of Austrian success, that Power was to have Silesia and to cede Venice to Italy. But the States of the Church were to be enlarged and the kingdom of Naples, it seems, was to be reëstablished. In return for this sacrifice by France of Italian unity, Austria agreed to sacrifice German unity. France was to rectify her eastern frontier, and the Confederation of the Rhine was to reappear in Southwestern Germany. All this if France would remain neutral and hold Italy back. But of course all these results were contingent upon the outbreak of the Austro-Prussian war; and Bismarck, uninformed, indeed, of the arrangements between France and Austria, but aware of the negotiations, did his best to make Napoleon believe that Prussia might still come to terms with Austria. One thing at least was perfectly clear—that Napoleon was anxious to see the war begun; and Bismarck, who desired from France nothing but neutrality, played upon Napoleon's anxiety with complete success. France pledged neutrality without any counter-pledge on the part of Prussia.

Meanwhile Italy had been informed that she was to have Venice in any case—even without fighting for it. Italy urged that she was bound to fight by the treaty of April 8. This Napoleon could not but recognize; but he counselled, or permitted his Ministers to counsel, that Italy should adhere to the letter rather than the spirit of her engagement. This, according to Von Sybel, explains the extremely lax conduct of the ensuing campaign by La Marmora.

NORTON'S TRANSLATION OF DANTE'S PARADISE.

The Divine Comedy of Dante Alighieri. III. Paradise. Translated by Charles Eliot Norton. Boston: Houghton, Mifflin & Co. 1892.

DANTE'S third canticle is the least known and the least understood; nor need we be surprised that this is the case, because the "Paradise" is the most ethereal of all great poems. Readers who are startled by the terrific pictures in the "Hell," are not always able to rise to the sublimity of the "Paradise," to appreciate which a deeper insight and stronger imagination are needed. Shelley, we know, ranked the third canticle highest, and we have heard Mr. Lowell ratify this opinion. A little reflection will show why this theme should be so difficult. Eternal bliss is the one thing that man can form no adequate conception of; he can imagine pain as being prolonged for ever—that is hell; but he can experience no single pleasure which would not become a pain if it were to endure for ever. How, then, describe the unimaginable bliss of Paradise? How attribute to heaven's hosts employments which shall not seem insipid or become monotonous? How portray the citizens of heaven with individual features, and not merely as vague embodiments of virtues? Dante has done all this, which, had he not done it, we should declare to be unachievable. By suggestions, by parallels, and often enough by silence, he has enabled those who read wisely to catch, as he himself caught, glimpses, symbols if you will, of that state of perfected souls which we call heaven. Wonderful, indeed, is the effect which he produces by his references to music and to light; most wonderful is the way in which Beatrice, the beatified woman, his ideal on earth, his guide in heaven, irradiates his ascent to the very throne of God. "Das Ewig-weibliche zieht uns hinan," said Goethe; Dante shows us in supreme fashion how ideal womanhood leads man upward to the empyrean where the mere human is merged in the divine.

Such high themes must necessarily be above the ordinary comprehension; but there are other difficulties which account for the comparative neglect of this canticle. It is concerned with scholastic theology, whose terms have become obsolete except to students, and whose propositions seem narrow and inadequate to the modern enlightened mind. Even Dante cannot always charge this theology with human interest, and his truest admirers must concede, therefore, that there are in the "Paradise" certain dreary patches, where only the antiquary or the theologian will care to linger. As a whole, this canticle is the least picturesque, because it is impossible, except by hints, to describe the scenery of heaven. Hell, with its murk and flames, its whirlwinds and precipices and frozen pool, could be painted most vividly; not so Paradise. Yet in no other part of his epic has Dante displayed so conclusively his mastery of what we may call the architectonics of poetry, reducing all his material to proper proportions, and maintaining, canto by canto, that correspondence of contrast needed to emphasize the difference among souls in Hell, Purgatory, and Paradise. Goethe, in the Second Part of "Faust," attempted an analogous development, but his work, in spite of many fine details, is mechanical as a whole; whereas Dante has hidden his machinery, and never allows us to hear the grinding of the wheels and the click of cog in cog. Though his theme is heaven, he constantly creates the impression of reality by references to earth, and in no other part of the 'Divine Comedy' does he admit us so intimately into the secrets of his own personality. In the famous apostrophe to the Roman Eagle, in Cacciaguida's account of uncorrupt Florence, he shows us his political ideals, and in many other passages he reveals his nature. Finally, the music of his verse pervades even those theological wastes we spoke of, and in neither of the other canticles can be found single lines or longer passages to be more treasured, whether for the beauty of their expression or the preciousness of their thought.

We set down thus, almost at random, a few of the impressions which a re-reading of the "Paradise" in Mr. Norton's translation, with the original at hand, has made upon us, because, having but little to say in criticism of the translation itself, we wish, as far as we may, to turn other readers to this crowning portion of Dante's epic. The translation is uniformly excellent, and almost invariably superior to Mr. Butler's. As an illustration of this take the well-known lines:

"Quale allodetta, che in aere si spazia
Prima cantando, e poi tace contenta
Dell' ultima dolcezza che la sazia,
Tal mi sembiò l'imago della impronta
Dell' eterno piacere, al cui disio
Ciascuna cosa, quale ell'è, diventa." (xx, 73-78.)

These Mr. Butler renders thus: "Like a lark which goes abroad in air, singing first, then holds her peace content with the last sweetness which sates her; such seemed to me the image of the imprint of the eternal pleasure, according to its desire for which each thing becomes of what sort it is." Mr. Norton's version runs: "Like as a little lark that in the air expatiates, first singing, and then is silent, content with the last sweetness which satisfies her, such seemed to me the imprint of the Eternal Pleasure, according to whose desire everything becomes that which it is." Here, as in numberless other instances which might be quoted, the superiority is fundamentally one of style, the power to put into better English more exactly the meaning of the Italian.

A minute criticism of Mr. Norton's translation might unearth particular words for which Dante scholars might prefer to substitute others, but we have noted no sentence which does not fairly interpret the original, and the choice of a particular word is largely a matter of taste. Thus, the *traligna* (xvi, 58) is represented by "degenerates," although the figure called up by the original is lost. Again, the much-discussed *si liqua*, in the first line of the fifteenth canto,

"Benigna volontade, in che si liqua,"

does not wholly satisfy us in Mr. Norton's "manifests itself." In xii, 99, we prefer to take *alta vena* as the object rather than the subject of *preme*, reading, "he went forth like a torrent which pours out a deep vein." So *ultimo* (xviii, 57) is better rendered "utmost" than "latest." *Ventre*, in xxiii, 104, is translated "bosom," in xxxiii, 7, "womb"; it would be well to use the latter word in both cases. How far English words which, if not obsolete, are at least unusual, may profitably be employed, is another question to be decided by individual taste. Thus, *convento* (xxx, 129) is rightly translated "convent," if we understand Dante to speak figuratively, but if he means, as seems more probable, a "coming together" or "assemblage," then the English "convent" is perhaps too quaint; for, though the Elizabethans used it as equivalent to "assemblage," custom has long since restricted it to specify the abode of monks or nuns. On the other hand, many of Mr. Norton's happy renderings deserve to be mentioned, as "crisis" for *punto* (xxx, 23), "bolted again" for *ricerna* (xi, 22), "paw" for *pianta* (xvi, 39); but they are part of the general excellence of the work, and it would be too long to enumerate them.

The notes, as usual, elucidate without going into discussion over the disputed points, and ought to suffice for any reader who wishes to get an understanding of Dante's general purpose. In the 'Divine Comedy,' as in the other supreme works of literature, the meaning of the really important passages is seldom perplexing; it is around details of phrase and textual minutiæ that commentators wage their too heated strife. The best advice that can be given to any beginner in Dante, or Shakspere, or Homer, is to master the essentials before turning aside into the maze of criticism.

In taking leave of this translation, we are reminded that within a generation America has produced the three most eminent English-speaking students of Dante—Longfellow, Lowell, and Norton, all neighbors at Cambridge. This is a fact for national pride, which too often exults over fleeting achievements in literature, to rejoice at. That Dante should be in large measure the master of three such men is also a significant fact, to be understood best by those who best understand Dante himself. His permanence was long since assured. His

theology has grown antiquated, his philosophy has been superseded; these were but the transient conditions of his time for which we make due allowance, and in spite of which his poem lives, and will live, because above all other poems it deals with the permanent concerns of the human soul. Besides Dante, only Shakspere had traced the full circuit of man's life. It is unnecessary, it would be idle to say which is the greater—such comparisons are for schoolboys; but we may say that in his direct influence in shaping character, Dante has no superior. From him whoever will may learn, as he himself learned from Brunetto Latini, *come l'uom s'eterna*, how man makes himself eternal.

But Dante is not only a great moral guide, one of the four or five men who have fathomed deepest the spiritual nature of humanity; he is also the consummate artist. His ethical power might have been forgotten had it not been interfused with his poetic genius. And at the present time it were well that any one who desires to express himself through literature should study Dante long and wisely. In his art is a corrective for the "Impressionists" of the hour, on the one hand, and for the shallow disciples of "art for art's sake," on the other. His compression rebukes the diffuseness which characterizes nearly all contemporary writing—he exhausts in a single passage an episode which would now be rolled thin through three volumes. His intensity, laying bare reality at one stroke, rebukes our Epidermists who, through lack of imagination, heap up innumerable petty details, in the hope that thereby they may produce at least a skin-deep semblance of reality. Dante teaches nothing more clearly than that the cumulative process can never do the work of the imagination, nor mere observation that of insight. Dante deals constantly with essentials; our literary workers, whether in prose or verse, deal too generally with what philosophers term accidents. Hence it would be a good augury for the future of our literature if those who are now seeking guidance from Muscovy and Scandinavia, from Paris and Madrid, would turn to Dante, the great example of what is permanently beautiful, the great antidote against literary aberrations. Those who cannot read him in the Italian will find in Mr. Norton's translation all that it is possible for a translation to give of his preëminent qualities.

FRANCE OF THE JULY MONARCHY AND THE SECOND EMPIRE.

An Englishman in Paris: Notes and Recollections. D. Appleton & Co. 2 vols. 8vo, pp. xv, 332; xv, 352.

THIS is an entertaining book crammed full of anecdotes about Frenchmen and Frenchwomen who were prominent in literature, art, and politics between 1830 and 1870. The first volume treats of the reign of Louis Philippe, the second of the Second Empire. The author, while giving some clues to his identity, conceals his name; and the easiest way to show a proper appreciation of the amusement he provides is to respect his incognito. He evidently belongs to an English family of distinction, was educated and married in France, where he was also well connected and where he spent most of his life; he never had any difficulty in becoming acquainted with the leaders of any of the several worlds which make up the world of Paris, and he seems to have had a truly Boswellian *flair* for celebrities, whether in the chrysalis or in the butterfly stage; he is quite devoid of every tincture of British insularity, and almost the only prejudice which can be laid to his charge is a very strong one against the bourgeoisie, imbibed during his youthful intercourse with the artists and other Bohemians who gave its peculiar character to the Quartier Latin in the thirties.

The Quartier Latin furnishes the theme of his opening chapter, which is mostly taken up with a description of the pranks, frolics, and practical jokes of the art students who inhabited a tumble-down building of five or six stories called "La Childebert," in the street of the same name, and many of whom achieved abiding fame; as witness Paul Delaroche, Tony Johannot, Aimé Millet, Eugène Delacroix, to mention only those whose reputation extends beyond France. As the building was too shaky to make dancing a safe amusement, the frequent festive gatherings of its inmates generally took the form of fancy-dress *conversazioni*, the peculiar feature of which was a strict adherence to the local color of the various periods represented. On such occasions

"the guests of the inmates of 'La Childebert' not only managed to out-Herod Herod in diction and attire, but, to heighten illusion still further, adopted as far as possible the mode of conveyance supposed to have been employed by their prototypes. The classicists, and those still addicted to the illustration of Greek and Roman mythology, though nominally in the minority at the 'Childebert' itself, were as a rule most successful in these attempts. The ass that bore Silenus, the steeds that had drawn the chariot of the triumphant Roman warrior, the she-goat that was supposed to have suckled Jupiter, were as familiar to the inhabitants of the Rue Childebert as the cats and mongrels of their own households. The obstructions caused by the former no longer aroused their ire; but when, one evening, Romulus and Remus made their appearance, accompanied by the legendary she-wolf, they went mad with terror. The panic was at its height when, with an utter disregard of mythological tradition, Hercules walked up the street leading the Nemæan lion. The aid of the police was invoked, but neither the police nor the national guards, who came after them, dared to tackle the animals; though they might have done so safely, because the supposed wolf was a great dane and the lion a mastiff, but so marvellously padded and painted as to deceive any but the most practised eye." (Vol. i., p. 14.)

When these scapegraces went to their favorite Théâtre Bobino, they joined in the choruses of the songs, and drowned the dialogue with interpolations from all parts of the house, until the noise rose to such a pitch that the manager came out and addressed them in a stereotyped speech, which they knew by heart, and in which he pointed out that the police would close the place if the audience disturbed the peaceful evening hours spent by the neighboring inhabitants in the bosom of their families; "which remark was always followed by the audience intoning as one man Grétry's 'Où peut-on être mieux qu'au sein de sa famille?' the orchestra—such an orchestra—playing the accompaniment, and the manager himself beating time." For the rest of the evening there was comparative quiet.

Although taking much delight in the society of these budding artists, it was the men who had already made their mark whom our author preferred in the world of literature. His great hero is Dumas (the elder), and he is never tired of sounding his praises, to which he gives up nearly all of his third chapter, with frequent references in other parts of the book. When speaking of the personal charm of Horace Vernet, he says that the only one of his contemporaries who exercised the same spell on his companions was Alexandre Dumas; in his account of the Duc d'Orléans, the oldest son of Louis Philippe, he calls him "one of the most charming men I have known. I always couple him in my mind with Benjamin Disraeli and Alexandre Dumas the elder. I knew the English statesman almost as well during part of my life as the French novelist. Though intellectually wide apart from them, the Duke had one, if not two traits in common with both: his utter contempt for money affairs, and the personal charm he wielded." (Vol. i., p. 294.)

The chronic impecuniosity of Dumas is much dwelt upon, and is favorably contrasted with that of other men, as, for instance, Lamartine. It was the more remarkable from the fact that for forty years Alexandre Dumas could not have earned less than $40,000 per annum, and that he neither smoked, drank, nor gambled, besides being a most frugal eater. Nevertheless, "it rained writs and summonses around him, while he himself was frequently without a penny."

"M. du Chaffault one day told me of a scene *à propos* of this which is worth reproducing. He was chatting to Dumas in his study when a visitor was shown in. He turned out to be an Italian man of letters and refugee on the verge of starvation. M. du Chaffault could not well make out what was said, because they were talking Italian, but all at once Dumas got up and took from the wall behind him a magnificent pistol, one of a pair. The visitor walked off with it, to M. du Chaffault's surprise. When he was gone, Dumas turned to his friend and explained: 'He was utterly penniless, and so am I; so I gave him the pistol.'

"'Great Heavens! You surely did not recommend him to go and make an end of himself!' interrupted Du Chaffault.

"Dumas burst out laughing. 'Of course not. I merely told him to go and sell or pawn it, and leave me the fellow-one in case some other poor wretch should want assistance while I am so terribly hard up.' " (Vol. i., p. 86.)

Work was a pleasure to Dumas, and while writing he would sometimes burst into a roar of laughter at the sallies of his characters. On one occasion, when he had been out shooting all day and was tired, he walked to a farmhouse to have a sleep; but, as the place was too noisy for that, he wrote a play in one act, "Romulus," which he sent to the Comédie-Française under a pseudonym, as the work of a young unknown author, and which was accepted without a dissentient vote.

Eugène Sue, who at one time divided the popular favor with Dumas, but has been distanced in the long run, does not fare nearly as well at the hands of our author, who accuses him of inveterate snobbishness, and of dandyism which was offensive because it did not sit naturally upon him. He was admitted to the Jockey Club as one of its original members, but made himself so offensive by the airs he put on after the success of his works had turned his head, that his name was dropped from the roll because, owing to a momentary embarrassment, he failed to pay his subscription; a rule being enforced against him which was almost a dead letter, but was seized as a pretext for getting rid of him. He endeavored to neutralize his expulsion by sending in his resignation, but the Committee adhered to its action. It is hard to realize at this distance of time what a sensation was created by 'Les Mystères de Paris' while it was appearing in serial form in the *Débats*, although on a larger scale it was similar to what we have witnessed in the case of Bellamy's 'Looking Backward.' Perhaps a further resemblance may occur to the reader of the following passage:

"In reality, Sue was in the position of Molière's 'bourgeois gentilhomme,' who spoke prose without being aware of it; for there was not the smallest evidence from his former

work that he intended to inaugurate any crusade, either socialistic or philanthropic, when he began his 'Mystères de Paris.' He simply wanted to write a stirring novel. But, unlike M. Jourdain, he did not plead ignorance of his own good motives when congratulated upon them. On the contrary, he gravely and officially replied in the *Débats* without winking. Some of the papers, not to be outdone, gravely recounted how whole families had been converted from their evil ways by the perusal of the novel; how others, after supper, had dropped on their knees to pray for their author; how one workingman had exclaimed: 'You may say what you like, it would be a good thing if Providence sent many men like M. Sue in this world to take up the cudgels of the honest and struggling artisan.' Thereupon Béranger, who did not like to be forgotten in this chorus of praise, paid a ceremonious visit to Sue, and between the two they assumed the protectorship of the horny-handed son of toil." (Vol. i., p. 57.)

Another famous writer of whom glimpses are afforded in these pages is Alfred de Musset, of whom we are told that, like Balzac and Dumas, he was even something more than a man of genius: he was a man of the world and a gentleman, who thought it worth his while to be an agreeable companion.

"Unlike Victor Hugo, Lamartine, Chateaubriand, and Eugène Sue, all of whom I knew about the same time, they did not deem it necessary to stand mentally aloof from ordinary mortals. Alfred de Musset and Alexandre Dumas were both very handsome, but each in a different way."

"De Musset improved upon better acquaintance. He was apt to strike one at first as distant and supercilious. He was neither the one nor the other—simply very reserved, and at the best of times very sad, not to say melancholy. It was not affectation, as has been said so often; it was his nature. The charge of superciliousness arose from his distressing short-sightedness, which compelled him to stare very hard at people without the least intention of being offensive." (Vol. i., p. 44.)

We have allowed so much space to authors that we have almost crowded out the painters, musical composers, actresses, princes, and politicians, to say nothing of other kinds of magnates at whom our Englishman takes his snap shots. On page 65 of the second volume, speaking of Persigny, he says that this statesman "frankly averred that he preferred Walewski's undisguised and outspoken hostility to De Morny's very questionable cordiality. 'The one would take my head like Judith took Holofernes,' the other would shave it like 'Delilah shaved Samson's, provided I trusted myself to either, which I am not likely to do.'" To Persigny the author attributes a very important part in the creation of the Empire. He pronounces him the superior of Louis Napoleon in energy and activity, and the prime mover in the *Coup d'État*. He says that "in Persigny's mind the whole of the scheme was worked out prior to Louis Napoleon's election to the Presidency." "He did not want a republic, even with Louis Napoleon as a President for life; he wanted an Empire." He asserts that as late as Nov. 26 Napoleon endeavored to postpone the stroke for a month, but that "De Persigny showed his teeth and insisted upon the night of the 1st or 2d of December as the latest."

Of Napoleon III. he speaks with toleration, and has a high opinion of his abilities; his view has much in common with that expressed in the memoirs of the Duke of Coburg. He says that he knew Louis Napoleon very well for nearly a quarter of a century, and felt as little competent to give an opinion of him on the last day of his acquaintance as on the first. Concerning his pronunciation of French he says that "the moment he became excited the *f's* and the *t's* and the *p's* were always trying to oust the *v's*, the *d's*, and the *b's* from their newly acquired positions, and often gained a momentary victory." He relates that in Napoleon's first interview with Bismarck the former complimented the latter on his French as follows:

"'M. de Bismarck, I have never heard a German speak French as you do.'

"'Will you allow me to return the compliment, sire?'

"'Certainly.'

"'I have never heard a Frenchman speak French as you do.'"

Of Gen. Cavaignac, the only serious opponent of Napoleon in his candidacy for the Presidency, our author speaks with the utmost contempt. He believes that

"the nobodies who have governed or misgoverned France since the fall of Sedan were, from an intellectual point of view, eagles compared to that surly and bumptious drill-sergeant, who had nothing, absolutely nothing, to recommend him for the elevated position he coveted. He was the least among all those brilliant African soldiers whose names and prowess were on every one's lips; he had really been made a hero of, at so much per line, by the staff of the *National*, where his brother Godefroy wielded unlimited power. He was all buckram; and, in the very heart of Paris, and in the midst of that republic whose fiercest watchword, whose loudest cry, was 'Equality,' he treated partisans and opponents alike, as he would have treated a batch of refractory Arabs in a distant province of that newly conquered African soil. He disliked every one who did not wear a uniform, and assumed a critical attitude toward every one who did. His republicanism was probably as sincere as that of Thiers—it meant 'La République, c'est moi,' with this difference, that Thiers was amiable, witty, and charming, though treacherous, and that Cavaignac was the very reverse. 'Thiers, c'est la République en écureuil; Cavaignac, c'est la République en ours mal léché,' said a witty journalist." (Vol. ii., p. 10.)

The highest praise is bestowed on Eugène Rouher, who was sometimes called the Vice-Emperor. He "was, both in public and private life, an essentially honorable and honest man—as honest as Louis Philippe in many respects, far more honest in others, and absolutely free from the everlasting preoccupation about money which marred that monarch's character. He was as disinterested as Guizot, and would have scorned the tergiversations and hypocrisy of Thiers. The only blame that can be laid to his charge is that he allowed his better sense to be overruled by a woman; but that woman was the wife of his sovereign."

The sentence last quoted leads to the remark that our Englishman lays the misfortunes of France at the door of the Empress Eugénie. He devotes a good deal of his space to her doings, and comments with more or less of sarcasm on her attempts to create a court out of rather unpromising materials. He disapproves, in words, of the manner in which the old noblesse showed their contempt for her, but seems to take pleasure in describing it. He relates that on the day of her marriage "portraits of the new Empress and her biography were hawked about. There was nothing offensive in either, because the risk of printing anything objectionable would have been too great. But there was one picture, better executed than the rest, which bore the words, 'The portrait and the virtues of the Empress; the whole for two sous,' and that was decidedly the work of the Legitimists and Orleanists combined. I have ample proof of what I say."

It is impossible, within the limits of an article like this, to give more than a bare indication of the abundance of interesting matter contained in the volumes before us. We could have filled our whole space with a condensed transcription of the anecdotes and amusing stories they contain—such as, for instance, that of the model who was told by David d'Angers that she would not do because she was too fat, and bounced out of the room with the remark, "Monsieur can't expect me to go into a consumption for two francs fifty an hour"; or the saying of a Frenchman about Lord Brougham, who often made himself ridiculous in Paris in a way not in keeping with his position at home: "Quant à Lord Brougham, il n'y a pour lui qu'un pas entre le sublime et le ridicule. C'est le Pas de Calais, et il le traverse trop souvent."

The Tempest. A New Variorum Edition of Shakespeare. Edited by Horace Howard Furness. Vol. IX. Philadelphia: J. B. Lippincott Co. 1892. Pp. xi, 465.

MR. FURNESS gives us, in his preface to the Variorum Edition of the "Tempest," an appetizer, as usual, for the feast of the commentators. It is an exposition of "the human and poetical side of *Caliban's* character." The central point is, that he had a soul imparted to him by *Miranda* as she taught him language. He never heard language from other lips than those of *Miranda* and *Prospero*. Mr. Furness sketches a lovely picture of summer night on the Enchanted Island from the glimpse which Shakspere gives when *Caliban* says that his mistress showed him the man in the moon with his dog and bush. With such a teacher, at such hours, it would be impossible to resist the atmosphere of poetry whose charm pervades the Enchanted Island. He always speaks in rhythm. It is he who gives the descriptions of the island which make it the "one magic isle of our imaginations."

One of the striking features of the volume is the number of beautiful passages from the commentators. The study of the play seems to have an effect on the students similar to that which *Miranda* and the island had on *Caliban*. Hazlitt, Hugo, Mrs. Kemble, Lowell, Ruskin, Dowden, Furnivall, Coleridge, Schlegel, and others of great name and fame rival each other in an eloquent admiration and happy exposition which takes a tone from the play itself. Allegorical interpretation is another striking feature of the commentaries. Shakspere is *Prospero*, *Miranda* is Art, *Ferdinand* is Fletcher; or may be *Prospero* is King James, and the teaching political; or it is a polemic against witchcraft, or a drama of reconciliation. Some of these speculators talk of the love tale as an episode, and complain of the *Miranda* and *Ferdinand* scenes as too long. Dry old heads these are. To simple youth all the rest is only a frame for these scenes.

There is a copious collection of discussions of the date of composition of the "Tempest"—thirty-four great fine-print pages. It would seem impossible to believe that it was one of the early plays, but that is argued at great length. Such argument belongs to the period before development ruled men's thought, when genius was regarded as something miraculous, a wonder-working power; the stranger the product attributed to it, the more readily it was believed—*credo quia impossibile*. A youth could write a book embodying the experiences of age, just as a world full of series of fossils could be made in an instant. One now can hardly help seeing that the author of "Romeo and Juliet" looks at *Juliet* and her father, and the author of "Hamlet" looks at *Ophelia* and old *Polonius*, from a very different

point of view from that from which the author of the "Tempest" looks at *Miranda* and *Prospero*. They are young eyes which see old *Capulet* and *Polonius* as superannuated old bores. Those are grave old eyes which give to *Prospero* a gleam that never was, on sea or land. He does not seem to be very wise in worldly wisdom, does not utter maxims like *Polonius*. He has traits of the weakness of age; he keeps calling attention to what he is saying, as though he fears he is not listened to; he scolds with harsh language, but feebly, without discrimination—*Ariel* as harshly as *Caliban*, and even *Ferdinand;* but he has a halo around him. The two or three passages which are so universally thought of as expressions of Shakspere in his proper person, bidding farewell to the stage, and which are so sad and grand, give a pathetic grandeur to *Prospero*.

"We are such stuffe
As dreames are made on: and our little life
Is rounded with a sleepe"—

this Shakspere has passed through the distressed questionings of the *Hamlet* period; he worries no longer. But his thought is like that of the heathen councillor in Beda who compares life to the flight of a sparrow through the banqueting hall, from darkness into darkness.

The text of the "Tempest" is one of the very best of the First Folio, and yet the commentary is very copious. The few passages which are obscure have been endlessly discussed. Mr. Furness suggests that it may be because this play is first in the Folio and other old editions, and the critics come to it with unspent zeal. Mr. Furness usually gives a satisfactory decision very briefly. In the longest collection of all, that on the passage where *Ferdinand*, dreaming of *Miranda* as he piles logs, says:

"I forget:
But these sweet thoughts doe euen refresh my labours,
Most busie lest, when I doe it,"

Mr. Furness thinks *Ferdinand* is apologetic, excusing himself for stopping and dreaming, on the ground that it will refresh him for more work. That seems rather a feeble lover, a *Hamlet*. He may be simply rejoicing in his thoughts, and encouraging himself to go on briskly by remembering that they refresh his labor even when he works most busily (most busiliest). Any meaning which makes "lest" emphatic makes woful metre. The criticisms of the Shakspere Society of Philadelphia, 1864-'5, are strikingly good. This Mr. Furness thinks is the oldest Shakspere Society in existence, having had continuous life from 1851 to the present day.

Dryden's version of the "Tempest" is here reprinted, with very slight omissions, and "The Fair Sidea" in English translation. Some Germans, with eyes such as Mr. Weller desiderated—double million magnifying gas microscopes of extra power—see in this play the source of Shakspere's. The appendix on the sources is very full and interesting, forty-five pages. There are discussions of the duration of the action, the music, costume, and many other matters; among the rest, a good deal of etymology and other philology.

Early Greek Philosophy. By John Burnet, M.A. Edinburgh: Adam & Charles Black; New York: Macmillan. 1892. Pp. 378.

THE modern interest in origins is continually shifting the centres of consequence in history and transforming unimportant tracts of human experience into important. This book deals with the first 175 years of Greek speculation, from about 600 B C. to the Peloponnesian War. Beginning with Thales and his immediate successors, Mr. Burnet traces the Ionic current through its aberrations in Pythagoreans, Eleatics, Empedocles, Anaxagoras, Leucippus, until it shoals upon Hippon, Diogenes, and Archelaus, and is ready to enter the Socratic gulf. Of course the Sophists are not included, nor is Democritus. It is a well-demarcated section of history, possessing a distinct character; yet, though it is one of the most constructive portions of Greek philosophy, hitherto it has received less attention from English scholars than the decadent days of Ciceronian eclecticism. Half-a-dozen essays on it have appeared, and it has been described at somewhat greater length, though still in popular fashion, in Ferrier's, Mayor's, Benn's, and Marshall's general histories. The only authoritative account, however, previously accessible to English readers was that of the two volumes of Zeller's history which are translated under the title of 'Pre-Socratic Philosophy.' Mr. Burnet shows a proper respect for Zeller, but differs from him freely. His book is based on an independent study of the sources, and enjoys the distinction of being at once a solid piece of scholarship and the only volume written in English which considers exclusively this first division of Greek philosophy.

The noteworthy peculiarity of Mr. Burnet's treatment is the extreme stress which he lays on the cosmological character of the period. These men, he holds, were not philosophers at all; they were, without exception, devotees of physical science, their single question being, How must body be regarded if we consider it the ultimate reality? With Hegelian or Platonic ideas they had nothing whatever to do.

"When an early Greek philosopher speaks of τὸ ὄν, he does not mean Being, but Body; τὸ μὴ ὄν is simply space, and not Not-being. There is always before the mind of an Anaximander or a Heracleitus a perfectly clear pictorial idea; his system is thoroughly *anschaulich*. When, therefore, we seek to understand these systems, what we have to do is not to think them by means of rational concepts, but to picture them in our minds by means of images. We do not understand the view we are studying till we have done this, and we ought even to be able to draw a diagram of it on paper."

From this point of view everything is interpreted, even that which at first sight seems most adverse to physical construction. Anaximander's "boundless" easily becomes boundless substance. It is declared an anachronism to connect a numerical philosophy with Pythagoras. He was an animistic "medicine man," with little interest in morals or mathematics. He founded no secret league, but prescribed certain ceremonial religious observances or "taboos," teaching metempsychosis and the doctrine that a kind of dualism is involved in the physical elements of the world. To suppose Xenophanes a monotheistic missionary is also a mistake. He really concerned himself with showing how the ground of the physical world must be sought within the world itself. Parmenides pushed his doctrine one step further when he demonstrated that there is no such thing as empty space. Heracleitus's fire is the veritable fire that burns and crackles; his justice, the observance of a balance between the elements of fire and water of which the world is composed. The Love and Strife of Empedocles are not forces, but corporeal elements, just like the other four. Even the *nous* of Anaxagoras is a body occupying space; and his ultimate molecules, or "seeds," contain not qualities but "things."

No one has ever doubted that Greek philosophy began by asking what the world is made of. But this inquiry itself has seemed to most historians to involve a metaphysic which men became progressively aware of. The common view admits that the early Greeks laid strong stress on the physical aspects of existence; but it maintains, as it seems to us with justice, that no abrupt break occurs between the first rough physical guess of Thales and the dialectic subtleties of Plato's 'Republic.' The interest of this early philosophy lies largely in the fact that it is dominated by intelligence at unawares, and so that it naïvely discusses in physical terms problems whose idealistic significance the next century began to perceive. Perhaps Mr. Burnet would not deny this. But he so subordinates the philosophic import, notably in his treatment of the Eleatic School, that the "body" which these men talk about often appears to be a thing exclusive of mind. Yet that is impossible. Before body and mind have been discriminated, primitive substance possesses the attributes of both. Between cosmology and philosophy there is then no distinction. If, however, Mr. Burnet's dislike of Hegel has induced in him an occasional blindness, he has at any rate done good service in pointing out the prominence of the corporeal factor in early Greek philosophy. Unquestionably he throws great light on many obscure topics. He writes with full knowledge of the German literature of the subject. He has subjected to fresh criticism an enormous mass of historical material, and he has produced a weighty and intensely interesting book with which every student of Greek philosophy hereafter must reckon.

Henry Boynton Smith. By Lewis F. Stearns, D.D., late Professor in Bangor Theological Seminary, Maine. [American Religious Leaders.] Boston: Houghton, Mifflin & Co. 1892.

WE must go back to the first volume of the series, 'Jonathan Edwards,' by Dr. A. V. G. Allen, for another that compares with this in the importance of its subject and the adequacy of the treatment it receives. Edwards was, of course, a much greater subject than Prof. Smith, and his biography, well handled, made a book of much greater interest than Prof. Smith was able to inspire. But Prof. Stearns has been moved to write a very clear and strong and sympathetic life of one who was a leading theologian of the Presbyterian Church in our own time, and to do it in such a way that those who are least attracted by his thought will find in his character and personality, as here described, much of that charm by which the living man drew to him a host of friends.

Prof. Smith was born and bred a Unitarian. He entered Bowdoin College in 1830, and while there "experienced religion" in the orthodox manner, and proceeded straightway to adjust his creed to his experience. His conversion was one of many in the College, which had grown considerably in grace since 1810, "when the heart of President Appleton was cheered by the admission of a single Christian student, there being no professed Christians in the College"—one sign of many that the religious as well as the political views of Jefferson were in the ascendant in the first decades of the century. Smith had none of the hatred of Unitarianism which generally marks its converts to the orthodox ranks, and something of its liberality was always characteristic of his intellectual operations, though other influences, and much more important, contributed to the same result, viz., those of his theological studies in Germany, whither he went in 1837, and

whence he returned in 1840. It is significant of the distrust of German studies which affected religious circles at that time that his superior training was a bar to his success on his return. For two years and a half the only friendly advances came from such liberal Unitarians as Channing and Parker and Clarke and Ripley and Hedge. For Ripley he translated something for his 'Specimens of Standard Foreign Literature,' and for Hedge's 'Prose Writers of Germany' he translated passages from Hegel and wrote a sketch of him. He was never taken in the Hegelian snare. He feared the Greeks bringing gifts even in those "fine days for theology," when so many found in Hegel the philosophical counterpart of the traditional creed. But his general faith in philosophy as the ally of revelation was not diminished by his distrust of the Hegelian system, so that it was only natural that, after a brief pastorate at Amesbury, Mass., he should become Professor of Philosophy in Amherst College.

While holding this position, he made, in 1849, the most significant effort of his whole career, the address at Andover on "The Relations of Faith and Philosophy." As a reply to Bushnell's "Dogma and Spirit," given at the same place the year before, it marked the position which he always held thereafter, opposing at once the most radical and the most conservative tendencies of the Congregational and Presbyterian bodies; in Prof. Stearns's phrase, he was "a mediating theologian." There was no more disparagement of reason in religion in his than in the Unitarian doctrine. But for "the central influence and the controlling energy" of his whole system he went to Revelation, and he assumed that Revelation stood inflexibly for the traditional scheme. There is something actually pathetic in his unconsciousness of critical science as a third factor in the business—one that would reassort and reinterpret the contents of the New Testament, and make it necessary to determine upon rational grounds the value of its different tendencies and parts. Prof. Smith had no suspicion of the fact that he was simply an apologist, the advocate of a foregone conclusion; but so it was, and all his brave philosophy was pledged to justify his theological beliefs.

From Amherst he was transferred in 1850 to Union Theological Seminary, where he was first Professor of Church History. An Old School man as a New England Congregationalist, he was a New School Presbyterian in his new position. Less advanced than Andover, he was more so than Princeton. He could not keep up with Park, but must keep ahead of Hodge, for whom Jonathan Edwards was not quite "true blue." In 1855 he was promoted to the chair of theology, and was at length exactly where he wished to be. From his teaching, the Seminary secured a consideration and an influence which it had never had before. As editor of a succession of Presbyterian Reviews he proved himself a master of polemics, and brought a searching criticism to the books which in succession challenged orthodox opinion, 'Essays and Reviews,' Renan's 'Life of Jesus,' and so on. But his criticism of Hamilton's doctrine of the unconditioned and of Mansel's 'Limits of Religious Thought' was much more valuable. Revelation without reason had for him no charms. To destroy reason in order to make Revelation indispensable was to make a wilderness and call it peace. His interest in the anti-slavery struggle and the war proved that he had not, in becoming a theologian, abdicated the functions of a man. No one was more active than he in bringing about the reunion of the Old School and New School Presbyterians. Prof. Smith did much better service as a thinker than as an "Ecclesiastical Statesman," and less by the particular results of his thinking than by his encouragement of the habit of thought, and by his conception of the theological field as embracing philosophy and literature and general history. For the annexation of science the time had not yet come.

The Silva of North America. By Charles S. Sargent. Part IV. Rosaceæ-Saxifragaceæ. Boston: Houghton, Mifflin & Co.

Prof. Sargent's fourth volume is devoted almost wholly to one natural order of plants, for of the forty-one trees which are described and illustrated, forty belong to the order *Rosaceæ*, and the forty-first is the only saxifragaceous plant within our borders which is fairly a tree. These two natural orders are very closely related, the genus *Spiræa* being rosaceous, and *Astilbe*, which is counted saxifragaceous, differing from it in only the slightest degree. The *Rosaceæ* include by far the larger proportion of the fruit-trees of the north temperate zone, such as cherries, plums, peaches, apples, pears, quinces, service trees, medlars, and hawthorns, besides the humbler bramble-berries and strawberries; and for this reason not only is this most careful account of our native rosaceous trees of great present interest, but in future years, when our native cherries, plums, and apples shall have been improved by cultivation and hybridization, it is to this volume that the pomologist will turn for a full description and history of the original stock.

The cocoa plum (*Chrysobalanus Icaco*) is a tropical American (and African) tree which occurs in Southern Florida. Its plums are pronounced sweet and rather insipid; they formed a favorite food of the Caribs four hundred years ago, and are still eaten by both whites and negroes. The genus *Prunus* is treated in its most comprehensive sense, and includes not only plums and cherries of all kinds, but also almonds, peaches, apricots, and laurel-cherries. Not all these sub-genera are found naturally in North America; but the author has something of interest to say about all of them in the foot-notes. Fourteen species of *Prunus* are described, seven of them plums and seven of them cherries of one sort or another. The choice of English names for the various trees shows no improvement over the earlier volumes, for no less than three species of *Prunus* have given them as vernacular appellations only the name "wild plum." A systematic botanist, in writing a work of this kind, has a splendid opportunity to fix and establish good distinctive common names; and one cannot but regret to see the opportunity neglected. The medicinal virtues of the wild black cherry are very properly referred to. A curious thing might have been mentioned in connection with it, viz., that the medical faculty generally write *Prunus Virginiana* when *Prunus serotina* is really intended, thus prescribing syrup of bark of the choke cherry instead of the black cherry.

The spiræas are none of them trees, and the *Nuttallia cerasiformis*, the oso-berry of California and Oregon, is only a shrub, and is therefore not recognized in the 'Silva.' The same is true of the interesting genera *Neviusia*, *Cowania*, and *Purshia*. The mountain-mahogany (*Cercocarpus*) is a tree, however, and both species of the genus have their place in this volume. *Vauquelinia* is a West American genus, of which one species forms a tree in Arizona and California conspicuous for its leaves, which are snowy white on the lower surface. The fruit is capsular and inedible.

The Linnæan orthography *Pyrus*, rather than the ancient classical *Pirus*, is properly adhered to for the name of the genus which includes apples, crabs, pears, choke-berries, and the various kinds of mountain ash. Of true apples three North American species are recognized—two in the Atlantic and Mississippi Valley regions, and one on the Pacific. They have all been cultivated for ornament, and varieties of some of them are already attracting attention for their fruit. It would seem probable that hybrids between Old-World apples and these American species will eventually furnish varieties able to withstand the cold of the far Northwest and yielding abundance of delicious fruit. The small fruits of the Oregon crab, with their pleasantly acid flavor, are gathered and consumed by the Indians. We have two species of mountain-ash, both much resembling the European rowan-tree; one of them (*Pyrus sambucifolia*) extends as far north as Greenland and even into Kamtchatka. There are described no less than fourteen species of thorn (*Cratægus*), in which genus this continent is far richer than Europe. The berries, or haws, of all of them are edible, though, as the seeds are large and the pulp scanty and very acid, they are fitter for making jellies than for eating in their natural condition. *Heteromeles arbutifolia* is a Californian tree with large panicles of small acid berries, and is said to be very beautiful in winter—"more beautiful, perhaps," the author says, "than any other North American tree." The Eastern shadbush, with its two varieties, and the northwestern (species of *Amelanchier*) come next. These yield the service-berries, which are gathered in great quantities by the Indians, and are dried into a kind of cake after being thoroughly crushed by pounding. *Lyonothamnus floribundus* is a saxifragaceous tree found only on some islands off the coast of California. It has large cymes of white blossoms, and leaves singularly like those of the sweet-fern (*Myrica asplenifolia*) of the eastern part of the continent. Our native species of mock-orange (*Philadelphus*) are only shrubs, and so do not have a place in this work.

Mr. Faxon keeps fully up to his high standard of artistic excellence; the shading on his apples and plums is especially worthy of high commendation.

Dynamics of Rotation: An Elementary Introduction to Rigid Dynamics. By A. M. Worthington, M.A., Headmaster and Professor of Physics at the Royal Naval Engineering College, Devonport. Longmans, Green & Co. 1892.

This little volume of only 155 pages will be very useful to those persons who have a slight knowledge of the most elementary principles of mechanics, giving them in a dozen sittings, or not many more, all that is necessary to render their previous knowledge applicable to practical problems. It is written, too, in no perfunctory way; but the author has seriously addressed himself to the problem in practical psychology of how to bring a mind uncultivated in mechanical conceptions into a state comparable with that of a good mechanical engineer, and has produced a successfully working solution of it. Having judiciously divided his subject, so as to separate the difficulties which the learner must encounter, he begins, under each branch, by pointing out

either familiar phenomena or else simple experiments to be performed; and by reflection upon these—by comparing and analyzing them under the guidance of the author—the student is gradually brought to a conception mathematically clear, which is at the same time firmly attached to well-recognized facts of observation. The result, we are confident, will be found to be that, considering the small amount of mathematics this little book supposes or teaches, the mastery it imparts to the student will be very satisfactory. As a good instance of the author's care, the mathematician should look over the explanation he gives of the gyroscope. We do not know where we have seen another, equally elementary, that has been so clear and detailed as this.

The merits of the work are such that we must forgive a few little slips of logic. Some persons might object that it does not cover the whole ground, in that, not only in the broad realm of rigid dynamics, but even in the narrower province of the dynamics of rotation, it does not teach all with which every man of good ordinary education ought to be well acquainted. But we are inclined to think that the author has exercised sound judgment in restricting his subject as he has done.

B. F. Stevens's Facsimiles of Manuscripts in European Archives relating to America, 1773-1783. Vol. XIII. Nos. 1301-1371. London: B. F. Stevens.

THE papers in this volume of the collection are pleasanter reading than most of those which have previously been published. They relate principally to operations in Paris in 1775 and 1776, when the French Ministers were trying to persuade Lord Stormont, the English Ambassador, that their intentions were pacific. With this view, they did not hesitate to give the most positive assurances of their wish and intention to live in peace and friendship with Great Britain. They promised that they would not directly or indirectly give the "American Rebels" any sort of assistance. Yet the Count of Vergennes, the French Minister for Foreign Affairs, did not resist the temptation of pointing out to his Lordship that England had herself to thank for her troubles, which were the natural consequences of the entire cession of Canada by France to Great Britain. "I was at Constantinople when the last peace was made," said the Count. "When I heard the conditions, I told several of my friends there that I was persuaded England would not be long before she had reason to repent of having removed the only check that could keep her colonies in awe. My prediction has been but too well verified" (1306).

Lord Stormont, meanwhile, was not deceived by the friendly professions of the Ministers. He suspected the connivance of the French Government at the sending of arms and stores to America. He had spies in the seaports and in Paris. But the nation as well as the court was against him. "The almost universal partiality of the French to the Rebels," says he, "makes it as difficult for me to collect information of what relates to the American agents as it is to get intelligence in an enemy's country" (1368). His Lordship's suspicions were not unfounded. The French Government was in fact conniving at the sale of munitions of war to American skippers, and was considering the policy to be adopted toward the "Bostoniens." Vergennes was a good friend to America at this juncture; he egged on his colleagues, he tried to excite the sluggish mind of the King. We have here several of those long documents emanating from his office in which the advantage to France of weakening her ancient enemy is elaborately set out.

There is nothing new to students of the period in all this, but the story is told in these papers with a minuteness hardly found elsewhere.

BOOKS OF THE WEEK.

HAVE JUST PUBLISHED:

HYDE'S
PRACTICAL ETHICS.

By Pres. WM. DE WITT HYDE of Bowdoin. 12mo, 219 pp. Teachers' price, 80 cents; by mail, 89 cents.

This book is intended chiefly for schools. It contains no metaphysical deduction from first principles, but simply the presentation in a rational and intelligible order of the concrete facts and consequences of conduct. Duties and virtues are commended, not by exhortation, but by showing the place they occupy and the part they play in a coherent system of truth and a symmetrical development of character.

BLACK AND CARTER'S
NATURAL HISTORY LESSONS.

Part I. For Primary Grades. Shelter, Food, and Clothing. By GEO. ASHTON BLACK, Ph.D., formerly Teacher in N. Y. Workingman's School.
Part II. For Grammar Grades. Plants and Animals. By KATHLEEN CARTER, Assistant in Botany in Barnard College.
12mo, 108 pp. Teachers' price, 50 cents; by mail, 54 cents.

SPECIAL CATALOGUES, describing HOUGHTON, MIFFLIN & CO.'s Books of *Art, Biography, Essays, Fiction, History, Poetry, Politics, Religion, Science,* and *Travel,* will be sent to any address upon application. 4 Park St., Boston.

CATALOGUE NO. 34, WITH USUAL variety of interesting items, ready. A. S. CLARK, Bookseller, 34 Park Row, N. Y.

READY AUGUST 20:

Select Cases on Evidence

AT THE COMMON LAW.

WITH NOTES.

A Text-Book for Students. By JAMES BRADLEY THAYER, LL.D., Professor of Law at Harvard University.

One volume, pp. 1,200. Cloth, strongly sewed, $7.50, net; half calf, $8.50, net.

Orders received by

CHARLES W. SEVER, PUBLISHER,
CAMBRIDGE, MASS.

Our new **Book Catalogue** not only gives the size and price of all the standard works on Homœopathy, but an interesting description of each, together with opinions of the press and of physicians. Mailed free.

Homœopathic Pharmacists and Publishers,
1011 Arch Street, Philadelphia.
Established in 1835.

"The weary brain requires some nerve sustaining element as food."—HERBERT SPENCER.

Crosby's Vitalized Phosphites.

The vital principle of animal and vegetable life isolated from the ox brain and wheat germ.

The loss of memory, the tired and exhausted feeling, the dull, unrefreshed sleep, or nervous sleeplessness, brain weariness, depressed vitality, are simply the brain and nervous system calling for their necessary food. In this condition the Vitalized Phosphites give great relief. It restores the true protagon, the brain phosphoid, increases brain and nerve power by specially feeding the nerve centres. It reinvigorates brain and body.

For thirty years endorsed by leading physicians and the world's best brain workers. Formula on the label. Pamphlet free to those who write for it. Druggists or by mail, $1.00. 56 W. 25th St., N. Y. *F. Crosby Co.*

Horsford's

ACID PHOSPHATE,

Recommended and prescribed by physicians of all schools

FOR

DYSPEPSIA, NERVOUSNESS EXHAUSTION,

and all diseases arising from imperfect digestion and derangements of the nervous system.

It aids digestion, and is a brain and nerve food.

NORTH CAROLINA, Asheville.

THE MAITLAND SCHOOL FOR Girls, 40 French Broad Avenue, reopens Monday, September 26.
Mrs. B. MAITLAND, Principal.

NORTH CAROLINA, Asheville.

RAVENSCROFT SCHOOL.—PREPARATORY Boarding and Day School for Boys. Head Master, RONALD MCDONALD, B.A., Oxford.

OHIO, Cincinnati, Mt. Auburn, 31 Bellevue Ave.

MISS LUPTON'S SCHOOL WILL reopen September 21. Pupils from this school have taken successfully the full Harvard Examination for admission, and have entered without conditions Vassar College and the Cincinnati University. A few boarding pupils are received. Circulars will be sent on application.

OHIO, Cincinnati, Walnut Hills.

MISS NOURSE WILL REOPEN HER English and French Family and Day School September 28, 1892. Pupils take special work or the full course for college examinations.

OHIO, Cincinnati.

MISS ARMSTRONG'S SCHOOL FOR Girls, Liddesdale Place, Avondale. Family limited. Circulars sent on application.

OHIO, Cincinnati.

EDEN PARK SCHOOL FOR GIRLS.—Twelfth year begins Sept. 26. Resident pupils limited to ten. For circular address Mme. FREDIN.

OHIO, Columbus, 151 East Broad St.

MISS PHELPS'S ENGLISH AND Classical School for Young Ladies.—Special advantages in Language, Literature, Music, Art, Oratory, Physical and Social Culture. Fall term begins Sept. 29, 1892.

PENNSYLVANIA, Bryn Mawr, 10 miles from Philada.

BRYN MAWR COLLEGE, A COLLEGE for Women, offers graduate and undergraduate courses in Sanskrit, Greek, Latin, Mathematics, English, Anglo-Saxon, French, Old French, Italian, Spanish, German, including Gothic and Old High German, Celtic, Hebrew, History, Political Science, Physics, Chemistry, Biology, and lectures on Philosophy, Gymnasium, with Dr. Sargent's apparatus complete. Fellowships (value $500) in Greek, English, Latin, Mathematics, History, and Biology. For Program, address as above.

PENNSYLVANIA, Bryn Mawr.

MISS BALDWIN'S DAY, BOARD- ing, and College Preparatory School for Girls reopens Sept. 28. For circular address
Miss FLORENCE BALDWIN.

PENNSYLVANIA, Chester.

PENNSYLVANIA MILITARY ACA- DEMY. 31st year begins September 14, 1892. A Military College. Degrees in Civil Engineering, Chemistry, and Arts.
Thoroughly organized Preparatory Department. Circulars of
Col. C. E. HYATT, President,

PENNSYLVANIA, Haverford P. O.

HAVERFORD COLLEGE.
Nine miles from Philadelphia.
Opens 9th mo., 21st. Apply to the Secretary, Haverford P. O., Pa.

PENNSYLVANIA, Lititz, Lancaster County.

LINDEN HALL SEMINARY.—99TH year will begin Sept. 14. Safe, comfortable school-home. Special attention to individual scholars. Liberal course of study. Rational methods of instruction. Circulars mailed on request.

PENNSYLVANIA, Logan, Philadelphia.

"WOODFIELD"
Residence of the late Clayton French.
Boarding School and College Preparatory for Young Ladies. (Established 1879.) Within easy access of Philadelphia. Two hours from New York. Board and tuition $600 per annum. For catalogue, address
PRINCIPAL OF "WOODFIELD."

PENNSYLVANIA, Ogontz.

CHELTENHAM MILITARY ACADE- my.—On the summit of the Chelten Hills, near Philadelphia. Bound Brook route to New York. Commodious buildings and extensive grounds. Attendance limited to 90 boys. $500 per year; no extras.
JOHN CALVIN RICE, A.M., Principal.

PENNSYLVANIA, Philadelphia, Bustleton.

ST. LUKE'S SCHOOL, A high-class school. Exceptionally healthful location. Delightful surroundings. Prepares for any college or business. Special care of younger boys. Number limited.
Illustrated Catalogue.
CHAS. H. STROUT, } Prins.
F. E. MOULTON, }

PENNSYLVANIA, Philadelphia, Germantown, 5128 Germantown Avenue.

FRANKLIN SCHOOL.—ESTABLISH- ed in 1853. Chartered in 1887. A School for Boys and Young Men. Will receive fifteen resident pupils. The Annual Register, with full information, sent on application.
GEORGE A. PERRY, A.M., Head Master.

PENNSYLVANIA, Philadelphia, Germantown.

GERMANTOWN ACADEMY.—ES- tablished 1760. Eight boarding pupils taken.
WM. KERSHAW, Ph.D.

Educational.

PENNSYLVANIA, Philadelphia, Germantown, 202, 204, 335 W. Chelten Ave.

MISS MARY E. STEVENS' BOARD- ing and Day School.—24th year. "Approved" by Bryn Mawr College. The Bryn Mawr entrance examinations are held in the school by an examiner from the college. School certificate admits to Vassar.

PENNSYLVANIA, Philadelphia.

MISS GORDON'S BOARDING AND Day School for Young Ladies, 4110 and 4112 Spruce street. Most delightful location in Philadelphia. 12th year opens September 21, 1892. French, Music, and College Preparatory.
Circular on application.

PENNSYLVANIA, Philadelphia, Chestnut Hill.

MISS COMEGYS AND MISS BELL'S English, French, and German Boarding-School for young ladies reopens Sept. 28.
Students prepared for college. Ample grounds for outdoor exercise.

PENNSYLVANIA, Philadelphia, 1350 Pine St.

MISS ANABLE'S English, French, and German Boarding and Day School. 44th year.

PENNSYLVANIA, Philadelphia, 2037 De Lancey Place (formerly 2106 Spruce Street).

MISS GIBSON'S FAMILY AND DAY School for Girls. Fall term begins September 29, 1892. Home pupils limited. Preparation for College.

PENNSYLVANIA, Philadelphia, 2045 Walnut St.

WEST WALNUT STREET SEMI- NARY for Young Ladies. 26th Year. Is provided for giving a superior education in Collegiate, Eclectic, and Preparatory Departments; also in Music and Art.
Mrs. HENRIETTA KUTZ.

PENNSYLVANIA, West Philadelphia.

GEORGE F. MARTIN'S SCHOOL FOR Boys. Established 1832. 6 boarding pupils taken.

SOUTH DAKOTA, Sioux Falls.

ALL SAINTS' SCHOOL.—A BOARD- ing and Day School for Young Ladies and Children. The school has special advantages; the terms are moderate; the building has every modern convenience; Bishop Hare makes it his home. The high and dry air of South Dakota proves often very salutary to those who need such a tonic. Sioux Falls may be reached by five of the great railroads of the country. For particulars address
ALL SAINTS' SCHOOL.

VERMONT, Burlington.

VERMONT EPISCOPAL INSTI- TUTE.—Home School for Boys. Prepares for college or business. Military drill; wholesome discipline; most beautiful and healthful location in the country. Terms, $375.
H. H. ROSS, A.M., Principal.

VERMONT, Saxton's River.

VERMONT ACADEMY Opens Sept. 6. For both sexes. Full equipment. Prepares for any college. Military Drill under officer detailed by War Department. Training for character and citizenship. GEORGE A. WILLIAMS, Ph.D., Prin.

VIRGINIA, Bellevue.

BELLEVUE HIGH SCHOOL.—THO- roughly equipped and of high grade, for boys and young men. For catalogue or information, address W. R. ABBOT, Principal.

VIRGINIA, Lexington.

VIRGINIA MILITARY INSTITUTE. 54th Year. State Military, Scientific, and Technical School. Thorough Courses in general and applied Chemistry and in Engineering. Confers degree of graduate in Academic Course, also degrees of Bachelor of Science and Civil Engineer in Technical Courses. All expenses, including clothing and incidentals, provided at rate of $36.50 per month as an *average* for the four years, *exclusive of outfit*. New Cadets report Sept. 1. Gen. SCOTT SHIPP, Supt.

THE BOSTON SCHOOL OF ORATORY. —The Leading School of Expression in America. First to teach the system of Delsarte. Send for Catalogue. MOSES TRUE BROWN, M.A., Boston, Mass.

Teachers, etc.

SOUTH OF FRANCE.—A FRENCH University Professor will accept two boys in his family. Board, with lessons in French, $500 a year each. Boys sent to Lyceum if desired. Climate very mild and salubrious. Address
M. DE RUTHIE, Agen, France.

GRADUATE of LEADING MILITARY School wants position in Physics, Chemistry, Mathematics, or Commandant of Cadets. Six years' experience; four years at Alma Mater teaching Physics. Address "P. & C.," care of *Nation*.

A COLLEGE GRADUATE AND SPE- cial student at Bryn Mawr, who has had experience in preparing girls for college, wishes a position for the coming year as teacher of Latin. Address M. E. GALE, A.M., Laconia, N. H.

A HARVARD GRADUATE AND German Ph.D. of experience wishes to tutor for the September examinations. Highly recommended. Address H. B., the *Nation*.

CHARLES W. STONE, Tutor for Har- vard, 68 Chestnut St., Boston.

School Agencies.

THE SCHOOL AND COLLEGE BU- REAU, Elmhurst, (Chicago), Ill., supplies colleges, universities, academies, public schools, etc., with the best teachers. Records of candidates thoroughly investigated and full information furnished to employers free of charge. Send for list of available candidates. Address C. J. ALBERT, Manager, Elmhurst, Ill.

AMERICAN AND FOREIGN TEACH- ers' Agency supplies Professors, Teachers, Tutors, Governesses, etc., to Colleges, Schools, and Families. Apply to
Mrs. M. J. YOUNG-FULTON,
23 Union Square, New York.

THE FISK TEACHERS' AGENCIES, 7 Tremont Place, Boston, Mass., 3 Union Square, N. Y., 106 Wabash Ave, Chicago, Ill., and 1205 South Spring Street, Los Angeles, Cal. 100-page Agency Manual free. EVERETT O. FISK & Co.

THE NEW AMERICAN TEACHERS' AGENCY.—Teachers seeking positions and those wishing a change at an increased salary, should address C. B. RUGGLES & Co., (Palace Hotel Building) Room C, 237 Vine St., Cincinnati, O,

AMERICAN AND FOREIGN Professors and tutors, governesses, teachers, etc., supplied to Colleges, schools, and families. MIRIAM COYRIÈRE, 150 5th Ave., cor. 20th St., N. Y.

SCHERMERHORN'S TEACHERS' Agency. Oldest and best known in the U. S. Establis hed 1855. 3 East 14th St., N. Y.

Educational.

MUSEUM OF FINE ARTS,

COPLEY SQUARE, BOSTON, MASS.
SCHOOL OF DRAWING AND PAINTING.
The Seventeenth Year will Open Oct. 3.
Courses in drawing from the cast and from life in painting and in decorative design, with lectures on anatomy and perspective. Principal instructors: F.W. Benson, E. C. Tarbell (Drawing and Painting), C. Howard Walker, J. Linden Smith (Decoration), Edward Emerson (Anatomy), and A. K. Cross (Perspective). Pupils are allowed the free use of the galleries of the Museum. For circulars giving detailed information, address Miss ELIZABETH LOMBARD, Manager.

WILSON COLLEGE FOR WOMEN.

Fifty miles southwest of Harrisburg, Pa., in famous Cumberland Valley. Six trains daily. Border climate, avoiding bleak north. $250 per year for board, room, etc., and all college studies except music and art. Large music college and art school. Music department this year, 154, independent of free classes. Full faculty. College course, B.A. and B.S. degrees; music college, B.M. Handsome park, large buildings, steam heat, gymnasium, observatory, laboratories, etc. No charge for distant pupils during Christmas and Easter vacations. Rev. J. EDGAR, Ph.D., Prest.,
Chambersburg, Pa.

WASHINGTON AND LEE

UNIVERSITY, LEXINGTON, VA.
Academic; Law; Engineering. Opens September 8. For Catalogue, address G. W. C. LEE, President.

LAW SCHOOL

WASHINGTON AND LEE UNIVERSITY, Lexington, Va. C. A. Graves, Prof. Com. and Stat. Law; J. Randolph Tucker, Prof. Equity, Constitutional Law, etc. Opens Sept. 8. For Catalogue, address
G. W. C. LEE, President.

OGONTZ SCHOOL

FOR YOUNG LADIES.

Established in 1850. Twenty minutes from Philadelphia, two hours from New York. Opens September 28th. For circulars and reports apply to Principals.
OGONTZ SCHOOL P. O., PA.

HAMPDEN-SIDNEY COLLEGE.

The 117th Session will open Sept. 15. For Catalogues and other information apply to
RICHARD MCILWAINE, President,
Hampden-Sidney, Va.

ABBOT ACADEMY FOR YOUNG LADIES.

Begins its 64th year Sept. 15, furnishing enlarged opportunities with superior accommodations in its new and improved buildings. Address
Miss PHILENA MCKEEN, Andover, Mass.

Siglar's Preparatory School

($600), Newburgh, N. Y.

Opens September 14. No rooms kept for boys not arranged for. HENRY W. SIGLAR.

UNIVERSITY OF MARYLAND,

FACULTY OF PHYSIC.
The 86th annual session will begin Oct. 3, 1892, and will end in April, 1893. Ample clinical and laboratory facilities. Circulars will be sent on application to I. E. ATKINSON, M.D., Dean, 605 Cathedral St., Baltimore.

Pennsylvania College of Dental Surgery.

The 37th Annual Session Oct. 3, 1892. Clinics ten months in the year. *Women admitted.* For information address C. N. PEIRCE, D.D.S., Dean, 1415 Walnut Street, Philadelphia, Pa.

The Nation.

NEW YORK, THURSDAY, AUGUST 18, 1892.

The Week.

THE Civil-Service Commissioners have done well to issue a proclamation calling attention to the provisions of the law which forbid political assessments and prohibit discrimination against or in favor of any employee by a superior because of his action in reference to contributions for political purposes. The request with which the proclamation closes, that any person having knowledge of any violation of the law lay the facts before the Commission, and the promise that "it will at once take action upon them," shows that its members "mean business." After such a declaration, it ought to be possible to get through the campaign without any of the old scandals about "voluntary contributions."

The Republican managers out West have evidently concluded that more is to be made this year by defying the Prohibitionists than by truckling to them. In State after State, conventions are held which refuse to put a single word regarding the liquor traffic into the platform, even though, as in Iowa, the last previous platform endorsed prohibition; or, as in Indiana, contained a local-option plank; or, as in Minnesota two years ago, endorsed high license and pledged the party to a continuance of this policy. It remains to be seen whether this change of base will prove to have been wise. There are signs, however, that in every such State the Prohibition party will cut more of a figure this year than ever before, and at present it looks as though the Republicans would lose fully as many votes to the third party as they can hope to keep from voting the Democratic ticket by their non-committal position on the liquor issue.

Mr. Robert P. Porter, Superintendent of the Census, delivered what the *Tribune* assures us was a "highly interesting and instructive address on the growth of religious denominations" at Asbury Park on Sunday. The speaker's effort in the main, says the same authority, "was to urge a federation of the churches with a view to more Christian harmony and less creeds." As Asbury Park is a rigid prohibitionist resort, there seems to have been a peculiar fitness in getting the enthusiastic advance agent of the "great Republican wine" to deliver an address there. The "Christian harmony" of the occasion might have been greatly enhanced by the reading of choice extracts from Mr. Porter's letter showing the skilful manner in which he had promoted wine-drinking among Republican statesmen. He sent five cases of the "great Republican wine" to the White House, another case to Cornelius N. Bliss, tried to get Vice-President Morton to buy some, and "was glad to hear that Mr. Whitelaw Reid is patronizing the wine which all true Republicans should drink." His struggles to make every hotel at which he stopped keep the wine, and thus spread the sway of the "demon drink," are graphically set forth in his letters. He "made a scene" in every hotel which did not keep the wine, and refused to drink any other, in one instance drinking Bass's ale instead—"Result—I am not feeling at all well to-day." Though born and reared in England, Porter has such a ferocious American stomach that English ale makes him ill. Finally, he induced Mr. Carnegie to make all the guests at his great tariff banquet drink nothing except the "Great Republican wine," and crowed about it as the grandest achievement of his career as a wine-agent. For aught the Asbury Park Prohibitionists may know to the contrary, Porter may have composed his address under the stimulating influence of American wine—not the brand which he "boomed" in his letters, for the proprietor of that is suing him in the courts for money advanced in the business, but some new brand which agrees better with his digestion.

There is a division of sentiment among Republican editors as to the wisdom of pushing the Force Bill issue. The Philadelphia *Bulletin* represents a class which opposes any further agitation of the matter, and questions whether such a law would do any good. Referring to Mr. Lodge's silence regarding the matter in his recent speech, the *Bulletin* says:

> "It is undoubtedly true that the practical value of any Force Bill is being doubted by more Republicans every day. Northern capital and emigration are doing for the South what legislation could not possibly perform. It is to these agencies that more conservative Republicans look to right the wrong; and if Congressman Lodge has joined this number, he has in all probability adopted the wiser course."

On the other hand, the New Haven *Palladium* takes the position that "the question of free suffrage and honest elections is one that takes hold of the foundations of our system of government"; that "the Republican party of to-day looks upon the question as the most important before the country"; that "the party is committed to the theory that free and honest elections can be best secured through Federal legislation and the protection of the Federal Government"; and that, "if Mr. Harrison is reëlected, there is no doubt that the most earnest efforts of his Administration will be extended towards the passage of a Federal election law by Congress similar to that which passed the House of Representatives of the last Congress."

A striking illustration of the importance of the Force Bill issue in the South is afforded by the recent action of ex-Congressman Ewart of the Ninth North Carolina District. Born of a Southern family, Mr. Ewart became a Republican in 1872, and was soon a prominent local leader in his party, being twice elected Mayor of Hendersonville, later a member of the Legislature, and in 1888 a Representative in Congress from a district which has a majority of white Republicans. The Force Bill came up during his first session, and he distinguished himself by making a statesmanlike speech against the measure. He characterized the Lodge Bill as "a sectional measure, designed almost entirely for the South," declared that "it would bring about bloodshed, terrorism, riot, and disorder," and told his Northern Republican brethren that the only remedy they could apply was to "mind your own business and treat the colored man of the South with 'wise and salutary neglect.'" Mr. Ewart's standing with his party at home was not injured by his revolt against the Force Bill. On the contrary, he is now stronger than ever. The district, which is always a close one, was carried by the Democrats in the "tidal wave" of 1890, but the Republicans hoped to recover it again this year, as in the last Presidential campaign. Mr. Ewart was universally recognized as their strongest man, and they asked him again to accept the nomination, but he has refused. His reason is that he cannot endorse the Force Bill feature of the Republican platform, and his opposition to this policy is so strong that he will vote the Democratic ticket as the only sure way of making his opposition effective. Mr. Ewart is by no means alone in taking this stand. A number of other prominent Republicans in the district have announced their intention to follow his example, and the party is likely to lose the district on this issue.

Even those who used to advocate the "Bill to Promote Mendicancy" now bear witness that the South has not needed appropriations from the Federal treasury to enable her to build up a good system of public education. Next to ex-Senator Blair, the Rev. A. D. Mayo was the strongest supporter of the scheme, and only a few years ago he was wont to declare that it was impossible for the South to get along without such help. Now he is delivering an address in which he says that "Virginia gives a five-months' free country school to its whole people, at an annual cost of $1,500,000; has rehabilitated its old academic and collegiate system, so that never before were so many of its youth in the secondary and higher schools; subsidizes the best institution for the training of the negro, and supervises

the best seminary for the manual training of the white youth in the South; with State normal schools for both races." Other Southern States are but little behind Virginia, and the influence of her example is spurring on the laggards. The best feature of it is the fact that this great educational advance is the work of the South herself, paid for by her own people, and so much prized by them that they are willing to pay more for the same purpose every year, instead of a sudden and unhealthy growth, fostered by Federal bounty, and so dependent upon such bounty that it would wither if the supply of cash from Washington should be stopped.

One of the most absurd performances by Congress at the demand—or supposed demand—of Labor was the passage at the recent session of a law which says that no person shall be employed more than eight hours, "except in cases of extraordinary emergency," by the Government, "or by any contractor or sub-contractor upon any of the public works of the United States." Although there is room for a difference of opinion as to what constitutes "a public work," there seems no warrant for doubt that this law will be held by the courts to apply to all contractors who do work for the Government. The effect of such legislation was clearly stated during the discussion in the House by Representative Mutchler of Pennsylvania, who said:

"There are in this country a number of corporations which do work for the Government and also for private individuals and other corporations, and all this work is done by the same employees. Take, for instance, the town of Bethlehem, Pa., in my own district, where work is being done for the Government. The employers must necessarily, under such a law as this, have two sets of employees; one set engaged exclusively upon Government work, and the other upon work for railroad corporations or for private individuals. Look at the embarrassment and annoyance that a plant of that kind will be subjected to by such a law. When the eight hours have expired, those who are engaged on Government work must stop, leaving the others to continue, because they will go on to work two hours longer and thereby earn more pay."

Already this absurd law has advanced the cost of contract work in one case 20 per cent., and we fear the Philadelphia *Press* does not exaggerate when it estimates that it will cost the Government $20,000,000 a year.

The strike among the switchmen of the Reading system in Buffalo has come to a head so suddenly as to surprise the public, which reads of violent outbreaks of lawlessness almost before it was aware that there was any dispute between employers and employed. The trouble appears to have arisen over a demand for higher wages on the part of the switchmen employed in the yards at Buffalo. It seems that Buffalo is the dividing line between the Eastern and Western roads, and that the Western roads pay higher wages to all employees than do the Eastern roads, these higher wages applying to the switchmen of Western roads in Buffalo. The Reading switchmen in Buffalo demanded the same wages as are paid to switchmen of Western roads in that city, but the company refused to grant the advance, on the ground that they could not yield it without also raising the wages of their men in New York, Philadelphia, Reading, and everywhere else on the system, which was impracticable. The only question then remaining was whether the company could find men who were satisfied to take the places of the strikers at the old wages. The officials claim that they have plenty of such men, and the attitude of the strikers indicates that this claim was well-founded, for they immediately resorted to wholesale violence, evidently fearing that, if they maintained the peace, the company would have all the switches manned within a few hours. Of course the merits of the strike are no longer in question, as the strikers have forfeited all claim to consideration by their resort to arson, their attacks upon the Sheriff's officers, and their threats to kill any new men who dare take their places.

It seems clear that violence was deliberately adopted by the strikers as the chief feature of their "plan of campaign" before the crisis actually came. President McLeod quotes from the report of a meeting of the men held on July 22 the following passage:

"The Worthy Master said that the present occasion would be a good one to decide how the strike should be conducted. McNamara said he was in favor of using force should it become necessary to do so; that his plan would be to run cars off the track, go through the yard, knock holes in engine-tanks, cut hose, etc., so as to disable engines. Murray, Smith, and others spoke against too much violence; agreed, however, that a little would be a good thing."

At the same meeting it was arranged that the strike should be declared at midnight, and the Buffalo men gave their word that all arrangements had been made to run off the track and wreck freight and coal cars enough from twelve o'clock midnight up to two A. M. to block up the whole road for a week, as the yard was full of cars. This plan was carried out to the letter, and now that it has been carried out, it is virtually endorsed by the union to which the strikers belong. It is true that Grand Master Sweeny makes this perfunctory declaration of disapproval: "Of course, no lawlessness can be upheld. The men should win by peaceable means." But no striker is going to be deterred from further violence by reading such mild and meaningless words as these. As at Homestead, so at Buffalo, "Organized Labor" resorts to violation of the law as the only hope of achieving its end, and there comes from no organization of laboring men any effective protest against this policy. The end must be the same at Buffalo as at Homestead—a growth of public sentiment against all labor unions, so long as they are conducted in this way.

It would be difficult to conceive of a more flagrant abuse of executive power in cases of capital crime than Gov. Buchanan of Tennessee has committed in commuting the sentence of Col. Henry Clay King from hanging to imprisonment for life. Col. King was proved beyond question to have been guilty of as deliberate and cold-blooded a murder as any man ever committed. He walked up to his victim in the public streets of Memphis and, placing a pistol against his body, shot him without warning and without giving him a chance to defend himself. Every court in the State before which the case was tried pronounced him guilty of murder in the first degree. There were no extenuating circumstances, a fact which is sufficiently emphasized by the successive findings by several courts of verdicts of murder in a community in which verdicts of that kind in "affairs of honor" are rare occurrences. That they were rendered against King, who had been a distinguished soldier in the Confederate Army and a brilliant member of the bar since the war, was an encouraging sign of advancing civilization in the State. The Governor has done all he could to check this advance by his indefensible course.

The *Tribune* asserts that "apparently" we did "not quote Senator Hiscock fairly" in respect to the effect of the tariff on farm products. The only quotation we made of the Senator's words was taken from his revised speech in the *Record*, where it stands precisely as we cited it. He said: "No one claims that they [agricultural products] were affected by the provisions of the McKinley Act." The *Tribune* regards this statement as "erroneous," inasmuch as the prices of "barley, live animals, of wheat, of eggs, and of some kinds of vegetables . . . and many other articles have been enhanced at some points in the country by the new duties imposed in the McKinley tariff." This raises the question whether the *Tribune* is able to quote fairly from itself. "Apparently" it is not, as on August 2 it declared that "the prices of food products were absolutely unaffected by the schedules of the McKinley Bill," and on August 4 it thought that "it can scarcely be necessary to explain that the new tariff was in no appreciable degree responsible for the change in the cost of food."

The continued fall in the price of silver is ascribed in some of the foreign journals to a prevailing belief that forced purchases of silver bullion by the Government of the United States will cease within a measurable period. This is a very reasonable supposition. Public opinion in this country touching silver is not what it was six months ago. The first symptom of change was the action of the House on the Bland Bill.

This was a House, be it remembered, that was expected to pass a free-coinage bill by a two-thirds majority. The Democrats had a two-thirds majority, and it was confidently predicted that there would be as many Republicans voting for free coinage as Democrats voting against it. Such was the common belief when the complexion of the House became known and for some time afterwards. Protection against a depreciated currency was looked for in a Presidential veto, and this Mr. Harrison virtually promised in his Albany speech about one year ago. He would hardly have taken pains to say what he did on this subject unless he had supposed that the danger was imminent. The Coinage Committee of the House was organized to put such a bill through under a high head of steam, but when the time came to report the Bland Bill, it was found that a most determined opposition to it had arisen, and when the vote was taken it failed to pass. Then the Democratic National Convention adopted a platform against free coinage on the present ratio of sixteen to one, and in favor of the unconditional repeal of the present Silver Law. Notwithstanding this plain deliverance, the Senate passed a free-coinage bill and sent it to the House, where it was beaten by a much more decisive vote than that which had been given on the Bland Bill a few months earlier.

Nobody will buy silver now except from hand to mouth. The market has got into the position that the promoters of the Anti-Option Bill wanted to make for wheat and cotton—those who deal in "futures" are out of it altogether. They have left silver to the manufacturers of tableware and ornaments, and to the few mints that continue to receive it for coinage. Our esteemed contemporary, the *Financial Chronicle*, thinks that the present decline may produce so much trouble in Europe as to give fresh interest to the coming conference, although it does not expect international bimetallism as a consequence. We have always maintained, and we now believe, that the greater the fall of silver, the smaller will be the chances of any action looking to its reinstatement as a money metal. The statesmen and people of Europe will congratulate themselves that they have little of it on which to make a loss—not more than they can easily manage. England's interest in India, in so far as it is commercial, differs in no wise from her interest in China, Mexico, or Chili, which are all silver-using countries. We never hear of anxiety in England on account of the silver currency of those countries. England's political interest in India is a trifle in comparison with her home interests, and these are strongly against bimetallism. England's greatest interest is that silver should sell for exactly what it is worth in a free market. This is the world's chief interest, our own included.

Mr. Gladstone's speech on August 9 marked the break-down of the last Tory prophecy, that he would not be able to handle his heterogeneous following. It was impossible even for his opponents not to admire the easy mastery with which he met the difficulties of his political situation. The Tory demand that he should announce his policy in detail before asking the Government to resign, he met by saying that never before had an Administration refused either to resign or to propose any policy in the face of an adverse majority returned in general elections, and, moreover, that there could be no Liberal policy until there was a Liberal Cabinet. The Conservatives had got a great deal of comfort out of the foregoing speeches of the Irish members, who had pretty plainly laid down the conditions on which they would support a Liberal Government, but Mr. Gladstone's remarks on Irish affairs were so skilfully conceived that he dissipated the Tory hopes of an Irish defection. He pledged himself on the general question of home rule in such a way that no Irish member could vote against him, and yet he refused to commit himself, as some of the Irish extremists wished, in regard to evicted tenants and imprisoned agitators. Some of them, especially the Parnellites, will vote with him with much grumbling, yet they will vote. In short, the prediction that Mr. Gladstone would fail for lack of tact and finesse in dealing with the Parliamentary situation was about the most baseless fabric of a vision imaginable, and the Tories have had to fall back on the dismal prophecies about his failing strength.

The tactics and taunts of the Opposition to Mr. Gladstone in Parliament are unintelligible on this side of the water. A majority of forty is larger than we are accustomed to see in the House of Representatives at Washington, although there happens to be a larger one now. Any party which shall enter the next Congress with the same proportionate strength that the Liberals have in the House of Commons, will be esteemed strong enough for all purposes. Of course our executive government is not a committee of the House of Representatives, and hence the conditions are not parallel. Nor does a majority here consist usually of parts of a party, as the Liberal majority is now made up. But on this point it must be said that on the main question at issue the Gladstonian parts are just as well united as the anti-Gladstonian. If the former consist of Liberals and Home-Rulers, the latter consist of Conservatives and Liberal Unionists. The cohesion of Mr. Gladstone and Mr. McCarthy is quite as likely to be permanent as that of Lord Salisbury and Mr. Chamberlain. One advantage possessed by the Opposition—that of holding the negative in debate and not being responsible for anything—it would be useless to ignore, but neither should that advantage be anticipated before the new Government is announced. All of Mr. Chamberlain's taunts are wasted upon our ears because we do not understand a system of government under which they would be considered appropriate or even permissible. The first thought of every American, when a new government comes in power, is to give it a fair chance and not to condemn it before it is tried. Yet the whole of Mr. Chamberlain's indictment and of all the rest of the Opposition speeches was tantamount to saying: "You have a majority, but you cannot use it; you are strong enough to turn us out, but you are not strong enough to govern the country after you come in." As that is the very thing to be proved, and as it can be proved only by experiment, we, in our provincial way, should say that such taunts might be best postponed for a few months—more especially since nothing under heaven can now prevent the Gladstonians from ruling till next February at all events.

The session of the Austrian Reichsrath just closed has been unusually rich in legislation. Besides deciding on the reform of the currency, the two houses have approved of important commercial treaties, and adopted proposals looking to the development of the city of Vienna and the steady employment by the Government of large numbers of laborers, in the regulation of the River Wien, the construction of canals, etc. This activity has unquestionably redounded to the credit of the Taaffe Government, to whose direct initiative all these measures were due. The German Liberal party has but grudgingly supported Count Taaffe and given him a working majority. It has just suffered a great loss in the death of Dr. Herbst, its most eloquent leader against the aggressions of the Czechs, whose demands grow louder and louder. In Bohemia the conservative counsels of the old Czech leader, Rieger, have been contemptuously set aside, and in Carinthia, Carniola, and Styria the Slovens are imitating the Young Czechs in their opposition to the German Liberals and in their insistence on the predominance of the Slavic tongue. Laybach, particularly, the capital of the province of Carniola, and ten or fifteen years ago to all intents and purposes a German city, has been gradually transformed into a Slavic one, and the Government has connived at the change, even overlooking a protest of the Municipal Council of Laybach against the festivities connected with the unveiling in that city of the statue of the great Liberal poet Count Anton Auersperg. It would not be strange if the German Liberals should refuse to serve Taaffe's purpose much longer, and should once more come out in open opposition to him. Seemingly sure of the Emperor's favor, he will rule with them if possible, and without them if necessary.

NEW YORK AND THE ELECTORAL COLLEGE.

It is noticeable that the political figurers upon both sides are talking about the possibility of winning the Presidential election without the electoral votes of the State of New York. On the Republican side it is claimed that the addition of six new States in the Northwest, with a total of twenty electoral votes, has greatly increased their chances for electing their candidate without the aid of New York. On the Democratic side it is claimed that the success of their party in recent elections in Iowa, Massachusetts, and Wisconsin, and the division of the electoral vote of Michigan, make it entirely possible that they should lose New York and still secure a majority of the Electoral College.

In order to judge of the merits and demerits of these claims, let us consider some of the possible combinations which might occur to justify them. The Electoral College of this year, compared with that of the last Presidential election, dividing the vote as it was cast in that election, is as follows:

REPUBLICAN STATES.	Old Ap.	New Ap.	DEMOCRATIC STATES.	Old Ap.	New Ap.
California	8	9	Alabama	10	11
Colorado	3	4	Arkansas	7	8
Illinois	22	24	Connecticut	6	6
Indiana	15	15	Delaware	3	3
Iowa	13	13	Florida	4	4
Kansas	9	10	Georgia	12	13
Maine	6	6	Kentucky	13	13
Massachusetts	14	15	Louisiana	8	8
Michigan	13	14	Maryland	8	8
Minnesota	7	9	Mississippi	9	9
Nebraska	5	8	Missouri	16	17
Nevada	3	3	New Jersey	9	10
N. Hampshire	4	4	North Carolina	11	11
New York	36	36	South Carolina	9	9
Ohio	23	23	Tennessee	12	12
Oregon	3	4	Texas	13	15
Pennsylvania	32	32	Virginia	12	12
Rhode Island	4	4	West Virginia	6	6
Vermont	4	4			
Wisconsin	11	12	Totals	168	175
Totals	233	249			

NEW STATES			
Idaho	3	Washington	4
Montana	3	Wyoming	3
North Dakota	3		
South Dakota	4	Total	20

The new colleges will consist of 444 votes, and 223 will be necessary for an election. If the Republicans were to carry the same States this year as they carried in 1888, they would have a majority and 26 votes to spare without the aid of the 20 votes of the new States. It will be seen that of the additional 23 votes which the old States have gained by the new apportionment, 16 are in the States which were carried by the Republicans in 1888 and only 7 in the States which were carried by the Democrats in that year. The Republicans have, therefore, reckoning on the party divisions of the last Presidential election, a net gain of 29 votes—that is, if we count the 20 votes of the new States as surely in their favor.

If we divide the States in accordance with elections which have been held since 1888, placing in the Democratic column States which have been carried by that party in two successive elections, the showing will be very different. The votes of New York, Iowa, and Massachusetts, 64 in all, will be transferred from the Republican to the Democratic side, making the Democratic total 239, or 16 more than the requisite electoral majority. This division still leaves Indiana, with its 15 votes, in the Republican column, and leaves there also the 14 votes of Michigan; but Indiana is confessedly a doubtful State, and at least four of the Michigan votes are conceded to the Democrats in the next election. Recent elections in Rhode Island have made that also a doubtful State, and it is admitted by all fair-minded judges that reasonable doubts may be entertained of the result in Wisconsin, and even in Illinois, this year.

In order to make a basis for combinations, however, let us take from both columns all the States that are by common consent pronounced "doubtful," and thus get a basis of reasonably certain States for each party. In view of recent elections the doubtful list must include the following:

New York	36	Massachusetts	15
Indiana	15		
Connecticut	6	Total	85
Iowa	13		

Giving the Republicans the 20 votes of the new States, this reduces their sure vote to 190, and the sure Democratic vote to 169, without making the Michigan division. Placing the Michigan vote at 10 Republican and 4 Democratic, the totals of sure States on each side will be Republican 186, Democratic 173. In order to win, therefore, the Republicans must gain 37 votes and the Democrats 50. The Republicans could win with any one of the following combinations:

Sure Republican States	186
New York	36
Massachusetts or Indiana	15
Total	237
Sure Republican States	186
New York	36
Iowa	13
Total	235
Sure Republican States	186
New York	36
Connecticut	6
Total	228
Sure Republican States	186
Iowa	13
Indiana	15
Massachusetts	15
Total	229

It will be seen that, in order to succeed without New York, the Republicans must carry every doubtful State and all the Pacific Coast and Northwestern States. Turning to the Democratic side, we have the following possible combinations:

Sure Democratic States	173
New York	36
Indiana or Massachusetts	15
Total	224
Sure Democratic States	173
New York	36
Iowa	13
Connecticut	6
Total	228

Giving the Democrats five instead of four votes from Michigan, making their sure total 174, we have:

Sure Democratic States	174
Indiana	15
Iowa	13
Massachusetts	15
Connecticut	6
	223

The Democrats could also win without New York and with only four votes from Michigan, provided they should carry, in addition to the four States enumerated above, Rhode Island or Montana, and the latter State has shown many signs of uncertainty in recent elections. They could also win without New York, or Iowa, or Connecticut if they could gain the twenty-four votes of Illinois, as follows:

Sure Democratic votes	173
Indiana	15
Massachusetts	15
Illinois	24
Total	227

It is obvious, however, that the vote of New York is the all-important factor in the calculations upon both sides, and that the candidate who receives that will, in this contest as in all previous ones, stand by far the better chances of election. Still, the Michigan division has introduced a new element of uncertainty, and it is by no means impossible that the result may be decided by that.

MORE CHILIAN AFTER-THOUGHTS.

A fresh crop of explanations in regard to the conduct of our diplomatic and naval officials in Chili marks the return of Consul McCreery to this country. He himself has a delightful tale to tell of the consuming love of Chilians for Americans, affirming that "there is not a particle of truth in the stories of ill-feeling on the part of Chilians against Americans." This is enough to bring President Harrison back to Washington in hot haste, to see personally to the dismissal of a subordinate who could thus coolly contradict the head of the nation. In a certain Presidential message the assertion was made, it will be remembered, that the "populace" in Valparaiso was "animated by hostility to the Government whose uniform the sailors and officers wear." But what the Consul has to say is not of so much importance as the published letter of Francis W. Egan and the article of Theodore Roosevelt in last week's *Independent*.

Mr. Egan, as might be expected from a member of an old American family, is especially strong in denouncing the "devilish malice" and "lying attacks" of such recent and unpatriotic immigrants as the Trumbulls, whom he has detected in the act of "currying favor with their English clients." But we cannot pause over the sublime spectacle of young Egan's patriotism; his explanation of Admiral Brown's conduct is the principal thing that requires consideration. It coincides in the main with that advanced by that expert in Chilian affairs, Mr. Roosevelt. Both think it a complete vindication of the American naval officer to say that the landing at Quinteros was known to the Balmacedist officials in the morning of the day in the afternoon of which he steamed up to the scene of the disembarkation. Admiral Brown went up there, says glib Mr. Roosevelt, "fulfilling his duty." This is a great advance over the best explanation ever before given of the Admiral's action—even his own—namely, that he went

out of idle curiosity. If he had any "duty" to perform on the Chilian coast, it was to protect American lives and property. A similar duty rested upon the other foreign war-ships in Valparaiso harbor, and, strangely enough, they thought they could best fulfil it by staying where they were. Admiral Brown, however, according to Mr. Roosevelt, thought the best way to protect Americans was to go where there were none.

Now, it has never been denied, so far as we know, that the insurgent squadron had been sighted off Quinteros before Admiral Brown went up there. The charge against him is, that he brought back more accurate and detailed information than was had before in Valparaiso, and that he gave his opinion, of the highest military value to the Balmacedists at the time, that the movement was not a feint, but a definitive landing. Says Mr. Roosevelt: "Not one shred of evidence has been offered in support of the malicious slanders" against Admiral Brown, and he thinks it is to the "infinite discredit" of the papers which have circulated these charges that such is the case. Now, there have been at least two shreds of evidence on this subject printed again and again, and it is to the discredit, infinite or otherwise, of any one making the above assertion that he ignores them. For Mr. Roosevelt's benefit we reproduce them once more.

On the morning of August 21, after Admiral Brown's return to Valparaiso and interview with the officials, a Government paper came out with the announcement of an impending battle, and added: "From trustworthy information brought by the American man-of-war *San Francisco*, we know for a fact that the revolutionists have landed at Quinteros, etc." When Admiral Brown reached San Francisco, some months later, he denied roundly that any such statement had been published in any Chilian paper, although copies of the original were then in more than one newspaper office in this country. This denial will do to go with his other one, that no despatch was sent by any one on his ship, except a cipher message to Washington; the latter has since been made to look particularly silly by the production of a facsimile of a cable message sent in plain English by his own flag-officer to a New York newspaper. The other "shred" is the following telegram, sent early in the morning of August 21 to Balmaceda himself by Intendente Viel:

"The American Admiral has left me only this moment, and he believes, as I do, that a reëmbarkation is not possible."

We have never seen any explanation or denial of this telegram. Secretary Tracy had his attention called to it by the Washington correspondent of the *Evening Post*, and complacently remarked that he thought it very likely the Admiral had talked over the military situation with Viel. If that is neutrality, what would be gross partisanship? If that is a model of discreet conduct "beyond praise," as Mr. Roosevelt calls it, what lengths would Admiral Brown have had to go to call for condemnation? Mr. Roosevelt demands "frank and humble apology" from those papers which have published the charges without any proof. We think that an apology for "baseless slander" is indeed due from somebody, but will leave it to Mr. Roosevelt, on reflection, to say from whom.

A fitting climax to the artificial patriotism displayed so freely throughout this whole Chilian affair has been the lying in state of the body of the murdered sailor, Riggin, in Independence Hall, Philadelphia. It was made perfectly clear by the papers of that city that the whole scheme was devised by one Philadelphia journal as a means of advertising itself. It had worked up a "Riggin Fund," and induced Mayor Stuart to give his consent to the exhibition in Independence Hall. The other papers, aware of the clap-trap nature of the whole performance, called upon the Mayor to rescind his action, pointing out, with entire justice, that an honor heretofore paid only to the remains of Henry Clay and Abraham Lincoln ought not to be cheapened by coupling it with an advertising dodge of a newspaper. But the Mayor had gone too far.

A TARIFF FOR WAGES ONLY.

In his examination before the Congressional Committee, Mr. Frick maintained a very bold front except at one point—when he was asked the labor-cost of producing a ton of steel. Though questioned on that head more than once, he refused to answer. This refusal he justified on the ground that he should not be expected to make public a business secret; but there are those who suspect that he was afraid of coming into collision with his former declaration that the tariff had nothing whatever to do with the Homestead troubles. However that may be, there is no difficulty in getting at an approximate answer to the question put to Mr. Frick. The cost of production of iron and steel has been the subject of many expert inquiries, and from them a fair estimate of the labor-cost may be derived, even if it should be true that the labor-cost to the Carnegie Company were less, and their profits correspondingly greater, than in the case of business competitors.

The thing to make plain at the start is, that the modern Republican doctrine of protection has come down to the explicit assertion that the tariff is put upon foreign competing goods "to make up the difference between the wages paid in the United States and the wages paid in Europe." That was the language held by McKinley, in his speech in this city on June 21; and to make his meaning still more unmistakable, he added:

"Whenever Europe will give to her workmen the same wages that we give to ours, then we will remove our tariffs and meet her in the neutral markets of the world, and it will be the survival of the fittest. Elevate your condition up to ours, and we will demand no protective tariff against the goods made by your labor. And I will tell you when we can have free trade in this country. It will be when the nations of the world will bring their social and labor conditions up to ours, for we will never level ours down to theirs. That is what a protective tariff means."

In this, of course, he was but expounding the plank in the Republican platform which says that the duties should be "equal to the difference between wages abroad and at home." No more explicit form of words could be chosen to say that if the duty on steel rails, for example, is greater than is demanded by the difference between the labor-cost in this country and in Europe, it is too great and should at once be brought down to exactly that difference. On the other hand, if the strikers at Homestead can show that their wages do not eat up all the protection on the goods they produce, but that a part of it is lost in extra profits to the manufacturers, then they have the authority of McKinley himself for demanding those profits as their lawful due.

Now, in the matter of steel rails, the United States Commissioner of Labor, Mr. Carroll D. Wright, prepared in 1890 a statement showing the labor-cost per ton in this country and in England. He based his figures on the cost of production all the way up from the ore and coal and coke to the finished product, and found the entire labor-cost of a ton of steel rails in this country to be $11.59. But the McKinley duty is $13.44, which is $2 too much on the new McKinley theory, even if the British manufacturer could produce rails without any labor-cost whatever. But when we find from the same investigation that the labor-cost in England is $7.81, we see that the tariff protection, on the principle that the "difference in wages" alone should dictate the rate, ought to be no more than $3.78 per ton. In other words, McKinley made his rate nearly four times as high as his own rule called for. The *Iron Age*, which no one ever suspected of understating the case for protection, recently gave the labor-cost of a ton of wire rods as $1.95; yet the tariff duty is six-tenths of a cent a pound, or $12 a ton—more than six times the labor-cost.

The tables of the last census relating to wages and cost of production are not yet available, but reference to the first annual report of the Commissioner of Labor and the report of the census of 1880 on wages will show how far from the truth is the late Republican discovery, that the protective tariff is solely to make up for the difference between wages in this country and in Europe. From the voluntary statements of manufacturers gathered in the reports referred to, it appears, for example, that the labor-cost of producing a pair of five-pound blankets is 35 cents; the duty on them in the tariff of 1883 was $1.90. Instead of lowering that rate to make it cover difference in wages and no more, McKinley increased it. The labor-

cost of a yard of four-ounce flannel was 3 cents; the 1883 duty was 8 cents, and McKinley put it higher. A gallon of linseed oil involves a labor-cost of 2 cents; the tariff of 1883 made it dutiable at 25 cents, and McKinley raised the rate to 32 cents. It would be easy to extend the comparison indefinitely, and show how thorough a "fraud" is the "Republican protection" for wages only.

All this relates solely to the theory on which, Republicans now claim, the protective tariff is constructed. As to the practical effect of a high tariff on wages, it appears, from the investigation of the Senate Finance Committee, that wages haye slightly fallen in highly protected industries and risen in non-protected. The published abstract of the results arrived at by the Commissioner of Labor, in his inquiries into the same subject in connection with the census, points strongly to the same conclusion. The N. Y. *Tribune* promptly sounded a note of alarm when Mr. Wright gave out his general results, and said that a false impression might be made by his hasty figures, and plainly intimated that the full report ought to be suppressed—at least until after the election. If the Republicans were content to join the ranks of the economists who say that a high tariff has nothing to do with wages, except to increase the cost of living and so indirectly to lower them, they could escape from some of the awkward questions suggested by the Homestead troubles. But as long as they maintain that the tariff is solely to keep up wages, they will all the while be running up against facts which show their professions to be fraudulent and their practical results delusive.

AN UNWORKABLE THEORY.

THE relations between workmen and their employers, never in very stable equilibrium, have been of late exceptionally disturbed, with the usual result of calling forth much good advice to both parties. In so far as this advice represents public opinion it will not be without effect, for neither laborers nor capitalists can be insensible to the feeling with which they are regarded in the community, any more than they can be insensible to the state of the atmosphere which envelops them. But in so far as this advice implies the acceptance of certain economic principles, its value depends upon the truth of these principles. If they are untrue, or if they have been generally represented to be untrue, it is hardly fair to blame workingmen for being reluctant to accept advice which assumes their truth. American laborers are, as a class, extremely intelligent, but even intelligent people may be misled by the statements of those who profess to be experts, and in our opinion they are now suffering from a misapprehension of some fundamental economic truths due to the fallacious teaching of some professed economists.

The unscientific spirit of this teaching is manifested perhaps most conspicuously in a very general exultation over the "explosion" of the wages-fund theory. It may be as well to say flatly that no such explosion has taken place. Undoubtedly, some writers have made absurd and exaggerated statements about the wages-fund, but all that is essential in this theory remains true and indispensable in any political economy that will work. No one who reflects can deny that the laborers employed upon a certain piece of work must be sustained while the work is being done, and this sustentation is the wages-fund. The element of time is the essential one, for in almost all modern industry the product is not consumed by those who produce it, but is exchanged for other products; and until the processes of production and exchange have been completed, which cannot be done instantly, there is nothing available for the laborer's support. It is true that a portion of his support he may himself provide, but this is immaterial, as is the circumstance that his employer may borrow his capital. What is true and important is, that, as a rule, in all modern industry, laborers engaged in any department of production are supported out of wealth already produced and not out of wealth to be produced. It is well enough to talk of the share of the laborer in the product, and to speak of the partnership existing between capital and labor, if these expressions are not taken literally; but unfortunately they often are taken literally.

Thus it is said by some, as, for instance, by Mr. F. A. Walker, that the laborer is not supported by the wages-fund, because he often lives upon credit until his job is completed, when his wages are paid to him out of the product or its proceeds. Others maintain a similar doctrine, that as the laborer works he becomes entitled to a certain share in the product, which really constitutes his wages. It ought to be enough to say in reply to these theories that the laborer cannot eat or wear credit, but must have food and clothes, and that these must have been created before he began his work. As to the second statement of the theory, we need only ask whether the laborers employed on the Panama Canal received as their wages certain undivided shares in the useless excavations that scar that isthmus. The same illustration exhibits the fallacy involved in the "industrial partnership" theory. The French investor knows well that the wages of these laborers were paid to them out of wealth that he had saved, and that in meeting the losses of this partnership he had no assistance from the partner who furnished the labor.

For it is essential to a partnership that there should be a community of losses as well as profits, and if it is true that the laborer's wages come out of what he produces, when that product has no value he gets no wages. The consequences of ignoring this obvious truth are very serious, for nothing is more common than for sentimentalists to dwell upon the large profits of some particular enterprise, and to insist that the laborers are entitled to their share of them, in addition to the wages for which they agreed to work. If these economists followed their reasoning out to its logical result, they would find themselves obliged to hold that when an enterprise fails, the laborers ought to repay to the capitalists the wages which were advanced to them out of a value that did not "materialize." Yet the "heads I win, tails you lose" theory has been represented as applicable to the laborer's case so generally, by the press and from the pulpit and the professorial chair, that it is not surprising if many laborers feel that the present method of fixing their wages deprives them of remuneration to which they are justly entitled.

As to the exceptional profits of particular enterprises, it is well to bear in mind that men of wealth seldom put all their eggs into one basket. The stock in a profitable concern is probably in most cases owned by men who own stock in many other concerns, some of which are very unprofitable. Their income is derived from the whole mass of their investments, good and bad, and if they were compelled to accept only a part of their gains while they bore all their losses, there is little doubt that the spirit of enterprise, so important to the interests of the community, laborers included, would be discouraged. This spirit demands the prospect of exceptional profits, for if there is no hope of large gains from a new venture, there is no motive for assuming a new risk. Perhaps it should be added that we are not considering a case where exceptional gains are due to exceptional fidelity and capacity in the laborers employed. In such a case, it is safe to say that a management sufficiently intelligent to be prosperous is likely to be sufficiently intelligent to understand the causes of its success, and to see that its employees do not become less efficient through dissatisfaction with their reward.

Taking a general view of the industrial field, therefore, it seems that capital is everywhere maintaining labor, paying wages whether the enterprise is profitable or not, and applying its exceptional gains to offset its exceptional losses. If it apparently, like the Lord of the Vineyard, pays the same wages for services that differ widely in productiveness, this is not done arbitrarily, but in pursuance of laws that are perhaps on the whole as beneficent as any substitutes that could be devised by human ingenuity. Certainly, the attempt recently made on the part of the laborers at Homestead to assert the existence of "vested interests" in the plant there, has made it manifest that the economic theories above criticised do not work well when reduced to practice. There is and there has been no "industrial partnership" there; nothing but a bargain on the part of capitalists to pay specified wages to laborers, let the issue as to pro-

fits be what it might. There may be said to have been an explosion there, but it was not an explosion of the wages-fund theory, but of the theory that holds that wages are paid out of the anticipated products of the future, and not out of the existing products of the past.

AT BODENSTEDT'S BIRTHPLACE.

PEINE, HANOVER, July 23, 1892.

IT would be interesting to make a dozen persons read Bodenstedt's famous songs of love and wine, and then have them guess in what kind of place the poet was born and brought up. Probably not one would descend in his thoughts from the gorgeous scenes of the Caucasus, where the singer has entertained him with the Oriental wisdom of Mirza-Schaffy, to anything like the sober plains between Brunswick and Hanover, where he would find the cradle of Bodenstedt in the prosy little town of Peine. It is true, Ernst Schulze as well as Hoffmann von Fallersleben might come to mind, both born in the same region and both poets of some note; but the contrast between their poetry and their early surroundings is not so striking as in Bodenstedt's case. The once monotonous Lüneburger Heide has furnished more than one poet; only special circumstances and experiences, however, could combine to produce such a seeming anomaly as the author of "Mirza-Schaffy."

When Bodenstedt was born, in 1819, Peine was a town of 3,000 inhabitants; when he died, three months ago, it had 8,000. In earlier times it was a strong fortress; at present it is a manufacturing town and quite an important railway station. An unusually large number of its houses still show the old-fashioned extremely low upper stories, with windows like mere loop-holes, but many have already been rebuilt in modern style. Such has been the case with the stately mansion of the Bodenstedts, which faces the market square, and attracts the attention of the visitor by the tablet bearing the name of the poet and the date of his birth, but still more by the large sign which invites hungry and thirsty souls to enter and refresh themselves in the Mirza-Schaffy Restaurant. Surely this is just as it should be, for no visible or external surroundings could make one appreciate Bodenstedt better than good wine and viands on the table, appropriate selections from his songs written out on wall and ceiling, and a picture of the genial singer looking down upon the cheerful feaster.

Bodenstedt's father was one of the prominent citizens of Peine, a self-reliant, self-exacting man of more than common intelligence and sagacity. He cared for the physical development of his son with something like Spartan rigor, but he also gave him the best mental training possible. The boy's grandmother was a rhymester, and the boy himself early began to imitate her, but soon concluded that nothing short of life's actual experiences would ever make a poet of him. It was this longing for the wide world, this desire to find something worth expressing, and the impulse to express it in artistic form, which made him accept a place as tutor in a Russian family at Moscow when he was but twenty-two, and could hardly be said to have finished his own studies at home. There he passed three pleasant and profitable years until he was called to the position of a teacher or professor in the Gymnasium at Tiflis, where the frequent holidays and the long summer vacation, in all about six months out of twelve, gave him abundant time to pursue his private investigations of the tribes of the Caucasus and to study various Eastern tongues. On his return to Germany, late in 1845, he went first to Göttingen and thence to Munich. From 1854 to 1866 he was professor of the Slavic languages in the Bavarian capital, and from 1867 to 1869 superintendent of the theatre in Meiningen. Afterwards he lived the life of a writer, journalist, and editor in Berlin, Trieste, Wiesbaden, and other cities; a life of which the principal interruption was his visit to our shores in 1880, or, as one might be tempted to call it, his triumphal procession from the Atlantic to the Pacific and from the Pacific back to the Atlantic.

When a poet is taken from us, it is natural and perfectly fair to ask how much of his work will outlive him and his age; but it is not fair for his contemporaries to forget how much even that which is likely soon to die has pleased and delighted them in days gone by. Our fast-living age is only too apt to forget this, and seems to be in danger of doing so with Bodenstedt. If, ten years ago, he was extolled too highly by his countrymen in America, he now appears to be underrated by some of his countrymen at home. That he was not a truly great poet is no new discovery, nor should it be laid to his charge; but to say that he was essentially shallow and too easily satisfied with the popular success of his Mirza-Schaffy songs is hardly just and true; for, light and frivolous as many of his ditties may sound, there are not a few passages in his prose as well as in his poetry which betoken an essentially serious nature. But, however this may be, to fix Bodenstedt's place in German literature will devolve upon a future generation; all that could possibly be done now, in an adequate critique, would be, and should be, to survey his activity as a man of letters in general, and to ascertain what this activity meant or still means for his own day and generation.

Bodenstedt accomplished several things for which he should be remembered. He served his countrymen as interpreter and translator of foreign thought. He left behind him valuable memoirs, and he made a large and lasting contribution to the world's cheerfulness in giving us his songs. Russia, Persia, England, and America—all are the better known to Germans and students of German for his having lived and written among us. His 'Reminiscences' can hardly fail to interest the historian of literature, for Bodenstedt's friends and acquaintances were numerous, and his reflections on men and affairs, though by no means always profound, often throw a sidelight on events of importance. His songs, again—those, at least, which were set to music by composers like Rubinstein and Franz—speak for themselves, and constitute that portion of his work by which he is most likely to live. Much of what he wrote on St. Petersburg, Moscow, Tiflis, and Constantinople, and much of what he wrote on or translated from Shakspere, Hafiz, Pushkin, Lermontoff, Kolzoff, Derzhavin, and Turgeneff, has lost its value and interest or has been superseded. But we ought to recall that, when he began his literary career, little or nothing was known on many of the subjects which he took up and rendered intelligible.

Moreover, he not only introduced Germans to the literature of Russia, but also Russians to that of Germany. When he went to Moscow, in 1841, he was still commonly mistaken for an Englishman because he came from a Hanoverian town. Beyond the names of Goethe and Schiller, and a few of their more popular works, German literature was a book with seven seals to Russians, and that which then constituted the literary life of Germany could not but confuse and disgust even the closest and fairest foreign observer. Heine and Börne were railing, first jointly at German politics, and afterwards at each other. Heine and Immermann were pitted against Platen; Gutzkow against Menzel; Börn against Wilibald Alexis; and, to make confusion worse confounded, Börne, Menzel, and Gutzkow together were picking flaws in Goethe and Schiller. In many Russian homes and families where these writers, not excepting the greatest, were scarcely known by name, Balzac, Dickens, and Thackeray were read and studied with astonishing eagerness. Hence, what an opportunity for the clever and enthusiastic young Bodenstedt to correct, teach, and enlighten! And this opportunity he seized and improved faithfully.

Of Bodenstedt's wide circle of friends and acquaintances it is impossible to speak here at all; nor can more than bare mention be made of his visit to the United States. Americans should read, in his 'Morgenland und Abendland,' the verses which commemorate this visit. Some of them will be found to be very prosy; others, for example the lines on Minnehaha and the little violet on the banks of the Mississippi, are truly musical and poetic. Interesting, too, are the sentiments expressed in his "Farewell to America":

"Leb wohl, Amerika, du Welt im Werden!
Aus unsrer Alten Welt erhabnen Trümmern
Vereinigst du, was Grosses ward auf Erden,
Und brauchst dich um Vergangnes nicht zu kümmern,
Derweilen wir noch stets vom alten Fluch
Zu dulden haben, der Geschichte Buch
Durchforschen müssen, gründlich zu erfahren,
Wie lang wir Narren der Geschichte waren.
. . . . . .
Leb wohl, Amerika! Was in dir Grosses,
Kann nur der Dummheit Neid und Hass erregen."

Of course, we notice at once that these lines resemble Goethe's

"Amerika, du hast es besser," etc.,

but what is of far greater interest than this resemblance is the fact, recorded here once more, that "the past," or what we call "history" and tradition, if dwelt upon to morbidness and heeded too anxiously, may become a fetter which makes men "fools" indeed. And it is from such fetters that even the highly civilized European feels himself freed when he first reaches the shores of the less civilized New World; freed too often, however, only by way of reaction, for further experience not infrequently teaches him that progress with absolute disregard of the "past" is just as blind as progress for ever looking backward is slow.

Let me conclude these reflections in the Mirza-Schaffy Restaurant with a few lines from the poet's 'Morgenland und Abendland,' which I take to be not only sincere, but also true and characteristic of him:

"Mit allem, was ich weiss, nahm ich es immer gründlich,
Mein Geist ist ernst, allein mein Herz ist leicht erzündlich.
. . . . . .
Oft ward ich unverdient gerühmt,
Oft auch getadelt unverblümt,
Doch der schärfste Tadel, den ich vernommen,
Ist mir stets aus dem eignen Herzen gekommen."

X.

BARDOUX'S LAFAYETTE.—I.

PARIS, August 5, 1892.

M. BARDOUX is one of our Senators, representing the department of the Puy-de-Dôme. He belongs to what we call, in our classification of

parties, the Left Centre, which means the moderate Republican. He was for a brief period Minister of Public Instruction. A man of some culture, he has published several books, the best of which are 'La Comtesse Pauline de Beaumont' and 'Madame de Custine,' as he had original documents to help him in writing these biographies. There is also a volume on 'Le Comte de Montlosier et le Gallicanisme.' I take no account of 'La Bourgeoisie Française,' which deals with generalities. M. Bardoux's style is very defective; there is in it a certain sort of fluidity which borders on what the French call "fadeur." It often aims to be eloquent when it is only commonplace. M. Bardoux is fortunate to have found some good subjects, and to have chosen interesting heroines and heroes; they have helped him more than he has helped them. This can be said essentially of his new work, 'La Jeunesse de Lafayette (1757-1792).' The youth of Lafayette is all the more interesting to study as he remained, so to speak, young all his lifetime. His passions were, at the end of a long life, what they were at twenty. You may judge of the style of M. Bardoux by this phrase: "If our heart brings back or fixes our sensibility on the day, happier than all others, of which we dream when we reënter into ourselves, this day was for Lafayette the one on which the generous wind of the eighteenth century blew him over to America."

Marie-Paul-Joseph-Roch-Yves-Gilbert of Motier, Marquis of Lafayette, was born on September 6, 1757, in Auvergne, in the old castle of Chavagnac. His father, Colonel of the Grenadiers of France, was killed at the age of twenty-four, a short time before he was born. At the age of fourteen, he entered, like all the gentlemen of his time, the military academy of Versailles. He was tall, red-haired, serious, awkward; he danced without grace, and did not ride well. As early as seventeen he was married to Adrienne d'Ayen. The Duc d'Ayen, eldest son of the last Marshal de Noailles, had five daughters. Adrienne was one of them; Pauline, another, became Madame de Montagu, whose memoirs have been published. Adrienne was only fourteen years and a half old. The Comte de Ségur, who was the uncle of Lafayette, writes in his Memoirs that "till he was eighteen years old, Lafayette had a grave and cold countenance which wrongly betokened embarrassment and timidity. This exterior coldness and little disposition to talk formed a great contrast to the petulance, frivolity, and loquacity of persons of his age; but this envelope concealed the most active mind, the firmest character and the most ardent soul."

Lafayette belonged to the most brilliant set of courtiers, headed by the Comte d'Artois, Havré, Guéménée, Durfort, Coigny, the two Dillons, the two Ségurs, the Comtesse d'Aremberg, the Duchesse de Fronsac. They met at an inn, near Porcherons, called the "Épée de bois." These young people were Anglomaniacs, and thought it necessary to drink much to be very English. "Don't forget to tell Noailles," said Lafayette one day to the Comte de la Marck, who was one of the set, "how much I drank," after having taken more champagne than usual. This life of dissipation did not last long. Lafayette was at Metz when he heard the news of the American Revolution from the mouth of the Duke of Gloucester, who was dining at the Governor's (the Comte de Broglie, the hero of the 'Secret du Roi,' one of the historical works of the present Duc de Broglie). Before the end of the meal, Lafayette had conceived the idea of going to America and of offering his services to "the insurgents" (or "Bostoniens," as they were then called). The sentiment of France was all on the side of the American colonies; the English game of whist was replaced by another game, "Boston." Was there not a curious symptom in this sympathy shown for the revolt of a people against a King? To be sure, some political calculation was mixed up with this generous sympathy; it was felt that if the thirteen colonies fell again under the yoke of England, France would soon lose her colonies in the West Indies.

The Comte de Ségur had formed the project of embarking for America with Lafayette and with the Vicomte de Noailles. The Comte de Broglie was let into the secret. He tried at first to hinder Lafayette from following out his resolution: "I saw your uncle die in the Italian wars; I was present at the death of your father at the battle of Minden; and I will not contribute to the ruin of the only remaining branch of the family." It was in vain. In vain, too, did the Duc d'Ayen fly into a great rage against his son-in-law. Society pronounced in favor of Lafayette and against the Duc d'Ayen. Lord Stormont, the English Ambassador, wrote to his Government: "If the Duc d'Ayen crosses his son-in-law in such an enterprise, he cannot hope to marry off his daughters." Lafayette entered into communication with Silas Deane, and signed an engagement. In order the better to cover his enterprise, he went to London, where he remained three weeks; he returned to Paris, left for Bordeaux, after having taken leave of his wife and of the Comte de Ségur, and succeeded, not without many difficulties, in embarking on the 26th of April, 1777, on his ship, which he called *La Victoire*.

M. Bardoux gives us several letters written by Lafayette on board the *Victoire* to his wife; they are in the sentimental style of the eighteenth century. Lafayette had left a child behind him, Henriette (who died during his journey), and his wife was on the eve of her second confinement. He tells his wife that he is glad to change his futile life for a useful life:

"In going, as a friend, to offer my services to this very interesting republic, I bring with me only my frankness and my good will—no ambition, no personal interest. In working for my own glory, I shall work for their happiness. I hope that for my sake you will become a good American. The happiness of America is intimately connected with the happiness of humanity; it is going to become the respectable and safe asylum of liberty."

On July 16, 1777, after six weeks afloat, Lafayette landed in Georgetown, S. C. He stopped first at the house of Major Huger, and left for Charleston, from which place he went on horseback, accompanied by six officers, to Philadelphia. He was for a moment coldly received—the Americans had been disgusted with the conduct of several French adventurers; but when the letters which he bore from Franklin and Deane to the Chairman of the Commitee on Foreign Affairs were read, there was a marked change, and on July 31 Congress accepted the services of Lafayette and gave him the rank and commission of Major-General in the American army. The meeting of Washington and Lafayette was very cordial. Washington invited Lafayette to inspect with him the forts of the Delaware and to consider his headquarters as his own house. "We shall be embarrassed," said Gen. Washington, "to show ourselves to an officer who leaves the French army." "I am here to learn and not to teach," answered Lafayette.

At the battle of Brandywine, Lafayette received a ball in his leg. He wrote to his wife September 12: "The English have gratified me with a ball which has slightly wounded my leg; but it is nothing, my dear heart, the ball has touched neither bone nor nerve." Some time afterwards, he writes to her:

"Now, as the wife of an American officer, I must give you your lesson. They will tell you: 'They have been beaten.' You will answer, 'It is so; but old soldiers always have the advantage over young ones, and they have killed many more of the enemy than they have lost themselves.' Then they will add, 'All right! but Philadelphia is taken, the capital of America, the bulwark of liberty.' You will answer politely: 'You are fools. Philadelphia is a sorry city, open on every side, and as a port was already closed. Being the seat of Congress has made it famous, I don't know why.' If they continue to press you with questions, you will send them to . . . in terms which the Vicomte de Noailles will tell you."

Lafayette was confined to his bed for six weeks, but, before his wound was quite closed, he rejoined the headquarters, where he heard the news of the capitulation of Burgoyne at Saratoga. I will not attempt to enter into the details of the participation of Lafayette in the efforts of the American army. I will only cite a few passages from his letters. On January 6, 1778, he writes to Madame de Lafayette, from the camp at Valley Forge:

"It is in a camp in the midst of the woods, it is in the heart of winter, that I find myself chained. . . . Don't you think I need very strong motives to make such a sacrifice? Everything bids me go away, honor bids me stay; and really when you learn in detail the circumstances in which I find myself, in which the army finds itself, my friend who commands it, all the American cause, you will forgive me, my dear heart, and I dare say that you will give me your approval."

It was resolved by Congress that the American troops should invade Canada, and Lafayette was chosen to command the expedition; but he said at once to the Commissioners of Congress that he would accept no command independent of Washington, and that the title of aide-de-camp to *him* seemed to him preferable to all the titles which could be given him. He therefore refused the title of Commander-in-Chief, and would only be an officer detailed by Washington. These conditions were accepted, but the expedition, in the heart of winter, could not take place.

In a letter signed by Lord Carlisle, one of the Commissioners sent from London in order to try to conciliate the colonies, the French nation was "taxed with a perfidy too well known to need fresh proof." (France had just made her treaty of commerce with the United States, had allied herself with them, and given them a formal recognition.) Lafayette was incensed at these words, and challenged Carlisle, who refused to fight a duel. Washington did not approve of the conduct of the young Marquis—the *boy*, as he was sometimes called by the troops. Lafayette himself wrote, twenty years afterwards: "Lord Carlisle was right."

He wrote to his wife before asking leave from Congress to go and offer his sword to France, who was at war with England: "The news of the war has been brought here by a French fleet which comes to coöperate with the American troops. New operations were on the point of beginning; we were in the midst of a campaign. It was not the moment to quit the army. . . . The moment, however, now approaches when I shall rejoin you, and next winter will see me united to all those I love."

Correspondence.

OUR MUDDLING COPYRIGHT ACT.

To the Editor of The Nation:

Sir: In your very kindly and appreciative review of my little book on 'The Horse,' which appeared in the *Nation* of the 7th of July, I observe a criticism on a singular error which occurs, I presume, in the American edition, for which I am not in any way responsible.

Your reviewer justly condemns the sentence which he quotes from p. 160, as follows: "The scapula is of complex shape, with strong projecting processes. In the horse (see Frontispiece) the humerus especially, so prominent a feature in the scapula of man, being scarcely visible. There is no trace of a clavicle."

In the English edition (of which alone I have seen a proof) the corresponding sentence (p. 149) stands thus: "The scapula [of man] is of complex shape with strong projecting processes. In the horse (see Frontispiece) the scapula is a very much simpler bone, long, narrow, flat, with the processes much less developed, the acromion especially, so prominent a feature in the scapula of man, being scarcely visible. There is no trace of a clavicle."

The suppression of so much of the sentence and substitution of "humerus" for "acromion" does certainly, as your reviewer says, "mar the precision of statement" aimed at, if not always attained, in the book. In justice to myself, I shall be obliged by your giving publicity to this note. I hope there are no similar instances of variation in the two editions.

Yours very faithfully, W. H. Flower.

British Museum (Natural History), Cromwell Road, London, S. W., August 3, 1892.

[Prof. Flower is a victim of our stupid requirement of American manufacture to insure copyright.—Ed. Nation.]

THE PROGRESSIVE MACHINE INDEX.

To the Editor of The Nation:

Sir: The answer to the criticism on the "Progressive Machine Index and Card Catalogue" published in the *Nation* of May 19, 1892, has been delayed until now, when a practical test in this library enables me to reassert the claims made for it by Mr. Cheney at the conference of the A. L. A. in San Francisco. Though improvements necessitating new patents will still delay, for a short time, a full explanation of the machine, enough can be said to indicate its advantages over the card catalogue.

The progressive machine proposed for this library (at present under advisement of the Board of Trustees) will consist of seven cases, enclosing twenty-one drums, with a storing capacity of over 2,000,000 entries. Each letter, except the very short ones, has a drum to itself, showing at one view about four pages of printed matter the size of those of the Peabody Catalogue. This is one advantage, and a very decided one, both for the public and for the cataloguer, whose work is simplified and facilitated by a conspectus of the matter in the process of arrangement. A good deal might be said on the advantage to the cataloguer, but I will say simply that experimentation has satisfied the cataloguers of this library that there is a saving of time and brain-labor greater even than was anticipated, and which can be appreciated only by actual use of the machine.

It has been demonstrated in this library that there *is* a "saving in time, in brain-work, and in investigation." And as to the "saving in pen-work, or type-writing, or printing," another advantage disputed by your correspondent, I have only to describe the method of work. The entries for the machine are clipped from library catalogues and publishers' lists of recognized authority, pasted upon cardboard prepared for the purpose, then inserted in the linked plates. The plates, being easily put in or taken out of the machine, this work is done at the cataloguer's table, and, when finished, inserted in the machine. No calculation need be made for space for future entries, as all the insertions are movable, and new plates may be put in wherever it is necessary. By using printed matter already carefully revised, greater legibility and accuracy are secured, in addition to the speed. To facilitate the cutting of the entries for insertion, we use a machine which separates neatly single nonpareil lines though the spacing be less than one sixty-fourth of an inch. Consequently, when the plate is filled, the edges fit so closely together that it has the appearance of one solid page.

To the above advantages must be added that of a catalogue always brought down to date. A new book may be entered at once in its proper place in the machine alphabet, where the public has the immediate use of it instead of being obliged to wait for the publication of a bulletin. There is never more than one alphabet to be consulted, while with the card catalogue there must be at least two—the general alphabet and the alphabet of books not yet bulletined.

Now let us take up, for a moment, the saving in money. This library, it is decided, must have a new catalogue. Printed, it would make three volumes, of 1,000 pages each, the size of the Peabody Catalogue. To prepare and print these here would cost about $25,000, and the time required would be about six years. The work can be done on the machine as proposed —21 drums—for $8,000, and in a time not to exceed 400 working days. Moreover, should it be thought best to print, $7,000 can be saved by using the machine *simply for "copy."* The printing can be done from the plates, which make the best of "copy," and the catalogue can be in continuous use during the printing, maimed only to the extent of, say, five plates sent daily to the printer. I need not enlarge upon the saving in corrections and in proof-reading and the gain in accuracy.

The progressive machine, simple in mechanism, and durable, used as a catalogue, reduces the cost of cataloguing by two-thirds. The saving by using it as "copy" has been before indicated; and the work, always down to date, can be as elaborate as the cataloguer has skill and patience to make it. Certain publications contain a regular monthly list of 70 to 100 topics in leading periodicals. These can be taken out bodily, pasted on cardboard, the proper shelf number written in the margin, cut, and inserted in the machine in about an hour.

As to space, a machine with three independent drums and cranks, containing over 3,000 leaves, size and contents of one full page of Peabody Catalogue, would require less room than a card-catalogue case of twelve drawers, which could hold, at most, 45,000 cards.

Finally, your correspondent says further, "The drawback of the scheme is, that the person who consults it prevents all other persons from using it at the same time." Let us see. In this library there is an average daily attendance of 600 people. Of that 600, 9 per cent. read current periodicals which require no consulting of the catalogue, and 51 per cent. use entirely our printed fiction catalogue, which leaves 40 per cent. to consult the general catalogue. Forty per cent. of 600 visitors would be 240 people, consulting 21 sections during 12 hours, or 13 people to each letter. This gives each consulter almost an hour on a letter. The above calculations have been made on statistics covering several years, and will hold good in any library of which we have the reports. But did all our 600 patrons consult the progressive machine proposed, my experience warrants me in affirming that the public would be better served than they are at present, or than they could be served by the best printed catalogues and the accompanying bulletins. I have thoroughly tested the machine, and shall soon be ready to place it at the disposal of Eastern libraries, when practical tests will support the results of our experience here.

Very respectfully, A. J. Rudolph,
First Assistant Librarian.

San Francisco Free Public Library,
August 3, 1892.

THE SEXES AS PUPILS AND TEACHERS.

To the Editor of The Nation:

Sir: Comment was made in your columns not long ago on the fact that more girls than boys completed the grammar and high-school course. How widespread this custom may be in the East, I am not prepared to say, but it is certainly true of the Central States, and especially in and about Chicago, where I have had charge of a public school for the last ten years. Last year I graduated from the eighth grade (the final year of the grammar school) a class of twenty-six, of whom twelve were boys —quite an exceptionally large percentage.

In his last report, President Nettelhorst of the Chicago Board of Education remarked on the fact that of the 3,000 teachers employed in the Chicago public schools, only 190 were men, and lamented the fact that women were supplanting men as public-school teachers. In my mind the two facts are closely related—indeed, are cause and effect. Pupils finish the eighth grade at about fourteen or fifteen years of age. Boys brought up in a busy, "hustling" American community, where the commercial rather than the literary or scientific spirit is active, are loath to stay in school anyhow, but especially so when they see an apparent vista of four years longer of petticoat government in the high school. Women have the patience to teach six-year-olds how to spell "cat" and how many 3s there are in 12; but women are not, as a rule, so successful as men of equal education in interesting larger boys in civil government and the broader aspects of American and English history, for example. Whatever the psychologic difference between masculine and feminine mind may be, young breadwinners and future voters seem to take to that portion of humanity which is interested in, say, free trade and the Australian ballot rather than in millinery and needlework.

In rural communities, women are employed because they are cheaper, and because the old derivative idea of a pedagogue as a slave who leads the child to and from school, prevails to a greater or less extent. Why women should be employed as principals to the exclusion of men in large Western cities, is hard to say. Perhaps it is because the rapid growth from a country village has not given men's minds time to adapt themselves to changed surroundings. Perhaps it is an exaggerated idea of women's

rights. Perhaps it is exaggerated American chivalry. A visit to Chicago schools would show that many large schools of, say, a thousand or more pupils, are managed by women entirely, many of whom are elderly, nervous, and destitute of culture or broad ideas. As Superintendent Howland said, "The principal is the unit of the school." Under certain restrictions he shapes the entire policy of the school; and his personality, his ideas, and his character pervade the entire system. Under such conditions, place in the office a fussy, fidgety, unliterary, unscientific old woman with a "good political pull," and what kind of a school have you? Boys don't like it.

What President Harper in the new Chicago University may do is hard to predict, but certainly he should raise the standard of scholarship and appreciation thereof in Chicago. There is no place where a college-bred man can do more good to a greater number, at less pay and with less credit or appreciation (save in his own inner conscience), than as principal of a grammar school in the West. When Chicago gets its growth, and men have time to think of their children more and their pocketbooks less, they will insist that the head of a grammar school shall be a man of collegiate (or equivalent) education. E. L. M.

COLLINGWOOD, ONT., August 12, 1892.

[Our woman-suffrage friends will be apt to insist that to qualify women teachers to "interest larger boys in civil government, etc.," they must have the same motive and the same opportunity for informing themselves that men have.—ED. NATION.]

Notes.

THE Century Co. will have ready in October 'Old Italian Masters,' consisting of Mr. T. Cole's engravings and his own and Mr. W. J. Stillman's text, already well known to the reading and art-loving public from the foretaste in the *Century Magazine*. A more costly proof edition of 125 copies of the cuts will be issued in portfolio, with the text in a separate volume.

Houghton, Mifflin & Co. promise a volume of late verse from Whittier, 'At Sundown,' with illustrations by Garrett; and 'Songs of Sunrise Lands,' by Clinton Scollard.

J. B. Lippincott Co. have in press a 'Boys' Book of Out-door Games and Recreations,' edited by G. A. Hutchinson; 'Memoirs of W. Nelson Pendleton, D. D., Brigadier-General C. S. A., Chief of Artillery, Army of Northern Virginia,' by Susan P. Lee; and a 'Handy-book of Literary Curiosities,' by William S. Walsh.

J. G. Cupples Co., Boston, will reprint, with illustrations in color, Edward Roth's 'Christus Judex: A Legend of the White Mountains.'

Messrs. Putnam offer to send to any person who has purchased their edition of Talleyrand's Memoirs a four-page sheet for insertion at the close of the last volume. It contains Talleyrand's latest act, a retractation of the errors of his life, and a letter of submission to Pope Gregory XVI. These characteristic documents were strangely withheld from the English translators of the Memoirs.

The *Bookman*, in its announcement of the Rev. Dr. Wright's 'The Brontës in Ireland,' says that the story of Mr. Birrell, repeated by Mr. Leslie Stephen in the 'Dictionary of National Biography,' that the real name of the family was Prunty, has no foundation.

Prof. J. H. Middleton's 'Illuminated Manuscripts in Classical and Mediæval Times; their Art and their Technique' (Cambridge, Eng.: University Press; New York: Macmillan) contains an answer to almost every question likely to be put concerning its subject. The first four chapters, which relate to the origin of books in all nations prior to the art of printing, ought to be a part of the furniture of every cultivated mind; and the same may be said of chapters x, xiii-xvi. The connection between the art of illumination and that of the weaver, the painter, the designer in stained glass and in mosaic, the jeweller, the goldsmith, is made plain; and, in the chapters not enumerated above, the achievements of the illuminators of the best epoch in each European country are set forth in detail from the finest specimens that have come down to us, with the aid of copious illustrations and abundant bibliographical references. A great deal of subsidiary information is packed away in footnotes, and is sometimes as remote as (for example) the date at which sugar, from being sold by the ounce as a costly drug, came into general use in Europe as an article of food. Prof. Middleton's arrangement is orderly, and his repetitions can readily be forgiven him; but not so the omission of an index, the need of which is crying.

The "Dilettante Library" (Macmillan) adds to its numbers two volumes on Browning and Whitman. The first, 'Browning's Criticism of Life,' by William F. Revell, endeavors to set forth in fresh terms the substance of Browning's ideas on God and man, love and knowledge, with the same results reached by other students who have made clear the imperfect measure of the poet's Christianity and the confusion of his philosophical scheme. The essay, however, is in the manner of a worshipper, and the stimulating and suggestive power of Browning is made much of, as it should be, though the fact that we do not look to poets for finalities of thought might have been more clearly acknowledged without injury to Browning's fame.

The second volume, 'Walt Whitman,' by William Clarke, might not unfairly be described as a socialistic tract in disguise. The author undertakes an exposition rather than a criticism of Whitman, and goes on to make the comment equal the text. The more interesting portion to us is his criticism of America, in which he antagonizes Arnold's somewhat specious dictum that we have solved the political and social problems, but not the human one. Mr. Clarke is of opinion that we have solved none of them. The Constitution broke down, he says, on the slavery matter, the only "serious" political problem we have had; and then loom up, one after the other, in his survey, our "Millionaires' Club," municipal government, luxury, laissez-faire, coal-barons, Pinkertons, etc., a procession as long as *Banquo's* line. The comparison with England is altogether to the advantage of that country. "The capitalist system of America is that of England, only more despotic, ambitious, and less scrupulous. . . . Pinkerton detectives shoot down unarmed men and women, and even children—an incident which could not be imagined in England; and it seems to cause but a ripple of mild protest even from excellent and kind-hearted people." This was written before recent events which must have hardened Mr. Clarke in his notions. But this, notwithstanding certain elements of truth, is a long-distance view, just as is his critical estimate of Whitman as the organ of democratic speech. The truth is that there is far more of idiosyncrasy than of our common national character in Whitman, and he represents America as incompletely as the Chartist poets represented the England of their day. Social agitation, however, rather than literary estimate, seems to be the reason for this book's existence.

Among recent reprints, Mr. G. A. Aitken's edition of Marvell's 'Poems and Satires,' in two volumes of "The Muses' Library" (Scribners) is at once the most tasteful and welcome. The previous issues of the series have familiarized the eye with the beautiful typography and mechanical execution of the volumes. The editor, whose work upon Steele earned him a deserved reputation for minute scholarship and research, contributes an excellent Life of the poet, and adds notes illustrating and elucidating the contemporary references, of the greatest value to the student, particularly in the case of an author so much mingled with his time as Marvell. The character of the severe patriot, as became a friend of Milton, is defended vigorously against recent attack upon him, and, altogether, we have Marvell now, in this edition, not only in a dress befitting a poet of strength and grace strangely blended, but also invested with a personal dignity and manhood befitting the poet of Puritanism.

Mr. Austin Dobson has brought out a reprint, limited to 500 copies, of Fielding's 'Journal of a Voyage to Lisbon' (Macmillan), the original edition, including the "Fragment of a Comment on Lord Bolingbroke's Essays." The edition is printed on hand-made paper and bound with simple taste. The editor's work consists of a brief account of the variation between the first and later editions, with the conclusion that the shorter one is the earlier, certain passages being omitted out of consideration to the living; and, besides, he adds several pages of notes of the sort of detail which proceeds from an acquaintance with the literature of the time, as if it were as accessible and inquisitive as the daily newspaper. This antiquary's knowledge, as it were, is nowhere more useful and often entertaining than in the decades of the last century. The sentence of Lowell, that Fielding best exhibits his own personality in the 'Journal,' fitly stands at the beginning of the volume.

We do not rate the critical faculty of William Hazlitt as highly as some recent writers, but the reprint of his 'Lectures on the English Poets' (Dodd, Mead & Co.), originally delivered in 1818, is an interesting specimen of the criticism of that age outside the reviews, and sheds some light upon the temper of the time. As a whole, the work is exceedingly scrappy and facile, reminding one of Edwin P. Whipple in a way, though Whipple lacked the gall of Hazlitt. The free speech in which Hazlitt indulges with respect to his own old acquaintances, Coleridge, Wordsworth, and Lamb, would hardly be countenanced to-day except on the score of an eccentric old age, which still has its privilege. The labored distinctions between this and that, contrasting violently with the vague flow of words about poetry and genius, are also of the past. We cannot say more of the lectures than that they are a better sort of review in a time whose reviews are held in no great honor, and that their contents, in point of thought, penetration, knowledge, and that orderliness which proceeds from a trained mind, have been surpassed by scores of volumes written since their day. To the historical student, or to one who has formed a taste for Hazlitt's "bite," they may serve a purpose; but the general reader will not lose anything by leaving them alone.

The fact that our early literature, from 'Beowulf' to Chaucer, has a wide strand of religion in it, has not usually been mentioned

with a view to recommending Cædmon and Langland and their lesser brothers for ordinary recreation or even instruction; but it is just this which has led Prof. T. W. Hunt, whose work has been noticed several times in our columns, and always, we believe, with a fair measure of praise, to devote a volume to these elders who never heard Emerson's new commandment of the Muse, "Thou shalt not preach." Dr. Hunt, under the title 'Ethical Teaching in Old English Literature' (Funk & Wagnalls), has really written an interesting account of the driest period of our literature, and, by availing himself of the antiquarian research of the last twenty years, has a long story to tell. He adds to the value of his summaries by giving extracts from the works of the shadowy figures of the first 500 years of English literature, reckoning from Cædmon; and, gathering vigor from this attempt, he does the same labor of appreciation for the still darkened years from Chaucer to Ascham. He particularly recommends his work to clergymen, but if any one desires a readable account of the most unreadable of mummied literature, he will hardly fare better than with this volume.

'Popular Studies of Nineteenth Century Poets,' by J. Marshall Mather (Frederick Warne & Co.), gathers in a thin volume a half-dozen lectures, originally prepared for workingmen's classes, on Wordsworth, Coleridge, Shelley, Byron, Hood, Tennyson, and Browning. They are slight in substance, rhetorical in manner, and very sound in morals. Such lectures, delivered *viva voce* to an interested class, might well be of service in their limited way; but in a book their defects become too apparent, their crudity annoys, and their rhetoric wearies.

The intrinsic value of the newspaper polemics gathered by Mr. Paul Leicester Ford in his 'Essays on the Constitution of the United States published during its Discussion by the People, 1787-1788' (Brooklyn: Historical Printing Club) is naturally inferior to that of Mr. Ford's companion 'Pamphlets on the Constitution.' Still, some of these series of letters are long and carefully elaborated, like Oliver Ellsworth's ("A Landholder"), which fills 64 pages, to say nothing of Elbridge Gerry's and William Williams's and Luther Martin's replies to him. James Sullivan, also ("Cassius"), fills 48 pages. The index is not quite adequate, as may be noticed in the case of William Williams's argument in favor of "putting God in the Constitution" (as the object of our latter-day movement has been called). The few entries under Slavery do not misrepresent the relative rank of this topic among the objections to the Constitution. The animadversions on the Senate fail to discern the peril to State politics of making Senators eligible by the Legislature, and so subordinating the State aspect and function of that body to the Federal, and forcing the State party divisions to coincide with the national. Ellsworth has a just phrase—"The danger of the Constitution is not aristocracy or monarchy, but anarchy." The collection is a valuable recovery of contemporary discussion from out-of-the-way sources.

The Bureau of Education has added three numbers to its series of monographs on American educational history edited by Dr. Herbert B. Adams. No. 11 is the history of the higher education in Michigan, by Prof. Andrew C. McLaughlin; No. 12 a similar history for Ohio, by Prof. George W. Knight and Prof. John R. Commons; No. 13, for Massachusetts, by George Gary Bush. All these are illustrated with views of buildings and grounds.

Still another issue from the Bureau is a long and fervid essay on "Southern Women in the Recent Educational Movement in the South," by the Rev. A. D. Mayo. The topic is one of very great importance. The following passage is pertinent to a recent discussion in these columns: "Up to the actual college age," says Mr. Mayo, "the girls, from the age of ten to eighteen, are already in overwhelming majority in the Southern schoolroom wherever I go." In one of his public addresses (1881) in the appendix Mr. Mayo speaks of "a large body of Southern young women . . . revealing the most intense desire for a superior culture, and the intention to take up the work of teaching with a will, in city or country, in the white *or negro* schools." Has this body ever been discovered by any other observer? There can, we think, be no question that the attitude of Southern white women towards Northern white women come to teach the blacks in a spirit of philanthropy has been the greatest obstacle to the spread and efficiency of these missionary efforts. Mr. Mayo now says, on p. 95, that the teachers from the North do not crave "social recognition," but do long and pray for "sympathy, confidence, and communion with the Christian women of the South for aid in their difficult work."

We can see only a happy innovation on the part of Mr. Arthur Winslow, State Geologist of Missouri, in choosing the folio form for his report on the first sheet of the Survey of that State. This choice was dictated by the sheet itself, which, on a scale of nearly a mile to an inch, represents an area of about 230 square miles, each side measuring a quarter of one degree. The sheet is thus conformable to those of the United States Geologic Survey, and, to avoid on the one hand folding and pocketing, on the other a separate map cover, the flat form is frankly adopted and the letterpress made to correspond with it, the whole making a not unwieldy brochure. The Survey begins in Lafayette County on the line of the Missouri River, and in a rich agricultural and promising coal-mining district, of which Higginsville is the principal town and railroad centre, giving its name to the sheet. This geologic and topographic contour map has been beautifully executed by Julius Bien & Co. of New York. We need not remark on the accompanying report.

Admirers of the humming-birds will find much to interest them in a paper, "The Humming-Birds," by Robert Ridgway, separately published from the Report of the United States National Museum for 1890, pages 253 to 383, having forty-six plates, besides illustrations in the text. Half of the work is given up to generalities—history, distribution, colors, nesting, feeding, and other habits, structure, etc.; the remainder contains descriptions and figures of species found in the United States, Mexico, Cuba, and the Bahamas.

At this year's national competition, held in July, of the 584 schools and classes connected with the Science and Art Department of the South Kensington Museum, London, the women students have met with preëminent success, carrying off five of the eight gold medals, and winning a large share of the lesser honors. More than 67,000 drawings, paintings, and modellings competed, coming from many parts of the kingdom. The rewards gained by the women covered a field so broad as to embrace first places for drawings from the nude and modellings from life, time sketches for figures in low relief, illustrations for children's stories, designs for book illustration, for a stained-glass window representing the nursery tale of the "Babes in the Wood," and decorative designs for textile fabrics, pottery, fans, and laces.

—We regret to learn that the Boston Public Library no longer exercises that discretion which led it, by an enlightened view of its duties and its interests, to grant to persons actually engaged in authorship the privilege of occasionally drawing books, although non-residents. The custom which has been discontinued was a generous one, but it illustrated the liberal public spirit which Massachusetts men desire to have characterize their institutions. It is certainly not far beyond the sphere of a great public library that it should assist literature upon necessary occasion or proper convenience; yet, at present, the loan of a book only for a few hours is refused. It is to the advantage of such a library that men of letters, although non-residents, should be interested in it, and the Boston Public Library profits by that interest; but so strict a rule, enforced in so absolute a way, may well bring in its revenges, if it is understood that literature in the person of its authors must always plead its privilege in vain. It may be that the custom was discontinued through some laxity in granting the privilege; but that a professional author requiring a volume for immediate use for a few hours should be denied, is an incident so unfit to happen in a city justly proud of its eminence as a centre of books, that notice of it may fairly be taken with a view to directing attention to the excessive rigor of the new rule.

—Certainly the most liberalizing event of this year's proceedings of the British Medical Association, just held at Nottingham, was the "extraordinary general meeting" called for the special purpose of considering the motion of Dr. J. H. Galton of London, "(1.) that Article 4 of the articles of the Association be altered by expunging the words 'no female shall be eligible for election as a member of the Association.'" The disabling clause it was proposed to expunge had been added to the original articles by vote of a large majority of the members in 1878. Several suggestive statements and admissions were made during the debate preceding the final vote. Those who had vigorously urged the exclusion of women for the past eighteen years, but who were now prepared to rescind their former votes, defended their action mainly by the fact that as women had, in spite of all opposition, entered the medical profession, it was illogical to continue to refuse them the lesser glory of society membership. The battle had been won by those women who, during the past twenty years, had, however severely handicapped, taken University honors and complied with the requirements of the most exacting medical examining bodies in the world. A barrier, therefore, by which in 1878 over 3,000 men opposed the possible admission of the eight English women then eligible for membership, has been levelled as useless in 1891, when there are in Great Britain 140 registered women physicians, and "more coming" from the schools successfully established for them in London, Edinburgh, Glasgow, and Dublin. The women having turned the flank of the enemy, graceful surrender was the only policy. The President of the Association presided at the meeting, well supported by the Council, and there was a large attendance of members, of whom much more than the requisite three-fourths voted in favor of Dr. Galton's enfranchising motion. This motion was appropriately seconded by Mrs. Garrett-Anderson, M.D., the soli-

tary woman who had gained admission before the prohibitory amendment was passed at the Bath meeting in 1878—an instance of poetical justice not often witnessed within so short a period as fourteen years.

—*La Réforme Sociale* for August 1 contains a paper on attempts made to cope with the liquor evil in the city of Marseilles. Up to 1871 the evil had not assumed alarming proportions, but since 1875 the consumption of spirituous drinks has increased from about 400,000 gallons to 1,320,000 gallons for a present population of 403,749, making three and three-tenths gallons per head, while the consumption per capita in 1875 was only one and a half gallons; the number of places where liquor is sold has increased during the same time from 2,400, being one dram-shop for 132 inhabitants, to 4,309, one for each 93 of population. In some streets there are three or four liquor-stores next door to each other, in others there are fourteen such places in thirty successive houses; one enterprising dealer has put up an automatic bar, where all kinds of drinks can be had by dropping a two-sou piece in a slot. About six years ago public attention began to be directed to the necessity of doing something to stem the rising tide of intemperance, and various measures of repression were urged upon the municipal authorities; the only one adopted was an increase in the octroi tax, which went into effect in 1889, but which, instead of diminishing the consumption, only increased the revenue. The other measures which had been proposed but not carried out were a diminution of the number of dealers, a vigilant supervision, and the establishment of free laboratories where the poor could have liquors analyzed. Finding that no relief could be had from the constituted authorities, and that private effort was the only alternative, the initiative was taken by the Savings-Bank of Marseilles, of which the author of the article referred to, M. Eugène Rostand, is the President. Such action may not seem, at first sight, to fall legitimately within the functions of an institution of that kind, but it arose from the consideration that the money squandered by the working classes on unwholesome liquors is so much in reduction of their savings, and that the latter will increase if the former can in any way be diminished. During the past five years the amount spent for drink in Marseilles was 84,000,000 francs; to estimate the actual total waste, we should have to add the wages lost through drunkenness, the charges for medical treatment, etc. And, viewing the situation from an opposite side, the savings habit may be cultivated as an antidote to the drink habit: a savings-bank book, once started, is in itself an eloquent temperance tract.

—The measures adopted at Marseilles in pursuance of this idea can be only very briefly indicated here. Naturally they were on a modest scale, being restricted alike by the money means available and by the legal restrictions with which a savings bank is necessarily safeguarded. The bank employed 160,000 francs of its own funds in building model dwelling-houses, with gardens, for workingmen, on the theory that if a man's home is made pleasant for him, he will not spend his evenings and his earnings in the cabaret; it also formed a stock company, with a capital of 250,000 francs, for the same purpose; it began a system of loans on mortgage to workingmen who wished to build their own homes; this led to the formation of the first coöperative building association established in France. A step in another direction was the establishment of school savings-banks with a view to instilling economy in the rising generation. From 198 deposits amounting to a total of 2,221 francs in 1887, the figures rose to 12,640 deposits amounting to 33,324 francs in 1891, and the number of participating schools has grown from 16 to 99; in the present year not only the municipal, but also the private and the church schools have joined. To stimulate the saving of small sums and get them away from the liquor-dealers, stamps are sold, of the value of two cents each, and when ten of them are pasted on a card, they can be deposited, a franc being the smallest amount a savings-bank can lawfully receive on deposit. Further, a series of popular lectures were delivered in different parts of the city, by the young physicians of the hospitals, on the specific diseases and the increased mortality directly caused by alcoholism, thus making an appeal to the selfish, prudential motives; and a very effective pamphlet on the respective effects of the bar-room and the savings-bank on independence, health, and happiness has been prepared and distributed. As all of the measures just enumerated date back only two or three years, they have hardly as yet produced an appreciable result; still, the consumption of liquors in 1891 exceeds that of 1890 by only 700 gallons, while the increase of 1890 over 1889 was 80,000 gallons. It is proposed to continue the good work by forming a league which shall pursue, on a larger scale, the methods already begun, and shall supplement them with more ambitious efforts. It is also proposed to stimulate the courts to a more rigorous execution of existing laws, as, for instance, the law prohibiting the sale of liquor within a certain distance of school-houses, etc., and to promote the enactment of such additional restrictive laws as may seem required. There is no idea of a resort to prohibitory legislation such as we know it.

—'To the Snows of Tibet through China,' by A. E. Pratt (Longmans, Green & Co.), is an account of several journeys of a naturalist in search of rare insects and birds. This object, however, is kept wholly subordinate in his book, which is an unusually fresh and interesting description of regions still very rarely visited by Europeans. To reach his collecting grounds it was necessary to ascend the upper Yang-tze by boat, probably the most perilous navigation in the world. In some of the gorges the boats have to be pulled up rapids by scores of men who crawl along paths a few inches wide on the face of cliffs a hundred feet above the raging waters. The loss of life is appalling, and on certain nights of the year there can be seen "thousands of tiny lighted lamps floating upon the river, offerings for the souls of those who have lost their lives by drowning." Of some of the ravines in the mountains which border on Tibet, Mr. Pratt says that it is quite possible to talk to a man across one of them where it would perhaps take a two days' journey to reach him, "so deep and precipitous are they, and dangerous to traverse." In this region is the sacred Mount Omêi, on whose summit, 11,100 feet high, formerly stood a magnificent bronze temple, now destroyed by lightning. Myriads of pilgrims flock to the spot in the hope of seeing the "Glory of Buddha." Mr. Pratt, who saw this phenomenon, is in some doubt as to its origin. He says "it is apparently the reflection of the sun upon the upper surface of the clouds beneath, and has the appearance of a golden disc surrounded by radiating bars, bearing all the colors of the rainbow. These are constantly moving, and scintillate and change color in a very remarkable manner." The vision excites the pilgrims to such a pitch of religious fervor that many throw themselves over the frightful precipice into the clouds upon which it appears, "their bodies, as a rule, falling upon an inaccessible spur covered with forest, perhaps a mile or more below." Though his journeys were made before the recent outbreaks against foreigners, Mr. Pratt was subjected to frequent annoyances, and at times his life was in some danger from the hostility of the natives. They could not understand his motives in coming among them, and believed him to be collecting children's eyes for magical purposes. Very severe winter weather was attributed to his presence. The Chinese are "a credulous and cowardly race," is his sweeping judgment of them. He makes numerous references to the French missionaries, of whose heroic devotion to their self-denying work he speaks most warmly, though of the measure of its success he gives us no means of judging, except that the Christian natives were his most faithful and intelligent collectors and servants. There are some striking illustrations from his photographs, and three appendices giving lists of the most important parts of his collections.

—Léon Cladel, who died at Sèvres on July 21, was a writer who belonged to that recent past which is always more remote from the present than if it were a century off. The height of bad taste is always the taste of the epoch which has just gone by, and Léon Cladel, who was a Romanticist, with a spice of the Parnassian in him, has had but little to say to readers of the last decade. He was born at Montauban in 1835, and, after he had taken his degree of bachelor in law, came to Paris to seek his fortune. Here he found two useful friends—Baudelaire, who recognized and encouraged his literary vocation, and Gambetta, to whom he was drawn as a child of the Midi and a fellow-Republican. His first novels were socialistic, almost revolutionary. 'Va-nu-pieds' and the 'Martyrs ridicules' are novels whose chief characters are of the oppressed and disinherited of the earth, whose sufferings push them toward revolt rather than towards resignation. His best work may probably be found in his 'Bouscassié' and in 'Montauban-Tu-Ne-Le-Sauras-Pas.' Later he gave himself over utterly to the rhetoric of freak and whim, and became a stylist for style's sake. One of his last performances was a series of newspaper articles, "Images Versicolores," in which he attempted to reproduce, by means of literary style, the sensations of color, light, and motion which certain well-known pictures give. He had also "views" about the consonants which recall Rimbaud's far famed sonnet on the colors of the vowels. This sort of work did not lead him directly to the temple of fortune, and he passed his later years at Sèvres, in a very modest dwelling, surrounded by his children and goats and dogs and fowls, all of whom lived together on a footing of delightful equality. His dogs, however, were said to be somewhat better combed and brushed than he—but this may well be due to some individuality of taste on their part, for, of Cladel himself, the laughers of Paris long ago said that whenever he made one of his rare toilets, he always ended the work by sticking a few straws in his hair. He left behind him more than the laughers—many sincere friends. Indeed, it is likely that many of the laughers were his sincere friends The Paris newspapers treat his memory generously, even tenderly.

JANNET'S CAPITAL.

Le Capital, la Spéculation et la Finance au XIXe Siècle. Par Claudio Jannet. Paris: Librairie Plon. 1892. 8vo, pp. viii, 607.

M. Claudio Jannet's latest book is an important and valuable addition to economic literature, and its value is enhanced by its attractive and readable style—a quality which should secure him a larger audience than is usually reached by writers on this science. M. Jannet is Professor of Political Economy at the Catholic Institute of Paris, and a disciple of Le Play, the founder of the "Unions de la Paix Sociale." He has at ready command the formidable apparatus of erudition which was originally set up by Roscher and now forms the necessary outfit of the veriest tyro in economics; he draws his materials from books, Government reports, reviews, magazines, and newspapers; his citations range from the Fathers of the Church to the *Nation* and the London *Economist*, the latter as late as April 9, 1892. If he had done nothing but bring together from so many sources the useful facts and statistics bearing upon the varied topics he treats, he would have earned the gratitude of all who take an interest in political economy; but, in addition to this, he marshals his materials so as to rear a formidable bulwark against the assaults of socialistic and sentimental opponents of existing institutions. Although his book is in the first instance expository and only incidentally controversial, he never hesitates to express his views on every controverted question, or to grapple with any assailant of what he considers the true doctrine; but however positive his avowal of the faith that is in him, and his condemnation of heretical teachings, he never oversteps the bounds of urbanity.

In his opening sentence he strikes the keynote of his book. Inequality of conditions, he says, is a law of humanity, and is, moreover, necessary to the development of civilization. He quotes with approval the dictum of Le Play that progress has always consisted in eliminating the communal institutions and the communal or corporate guardianship which, under the old régimes, checked the upward soaring of the most gifted individuals and brought them back to the commonplace dead level. Democracy, he continues, while recognizing equality before the law and the equal right of all to share in the government, by no means implies the levelling of wealth. The experience of a century, whether in Europe, America, or Australia, shows the greatest spread of the democratic principle coincident with a large development of inequality of wealth. This state of things he considers no impairment of the condition of the masses, but rather a benefit. Wages are highest where there is most wealth. He recurs to this idea in various parts of his book, and approaches it from various points of view. Thus, in another place, he shows how, in a wealthy community, labor is in continuous demand, and not only better paid, but more sure of steady employment. Capital seeks labor, and, as is shown by the constantly declining rate of interest, contents itself with a steadily diminishing share of the profit. In this way the increased wealth of the upper and middle classes is the direct cause —the mechanical cause, he calls it—of the amelioration in the condition of the working classes. Elsewhere, again, he recurs to another phase of the same thought when he illustrates, by a variety of instances, how the large fortunes gained in modern industry are a benefit to the community. Thus, to select only two or three of the cases he cites, the millions amassed by Bessemer are insignificant when compared with the development he gave to the steel manufacture and with the immense reduction in the cost of transportation resulting from it; Bass, the brewer, is said to have paid a million of dollars in a single year to railroads and steamships for freight charges, so that what he caused others to gain is much more than what he gained himself; many millions of money have been expended, mostly in wages, in experimenting and in perfecting new processes.

All of this, it will be seen, plainly implies a repudiation of Henry George's contention that while the rich grow richer the poor grow poorer, and do not get their fair share of the world's increasing wealth. But M. Jannet directly challenges the truthfulness of the alleged facts on which this contention is based. He maintains, on the contrary, that the improvement in the condition of the working classes is shown in many ways: in countries where there is an accumulation of capital, native workmen disdain the lower kinds of labor and abandon them to immigrants from poorer communities; the British Army is recruited mostly from the Irish, and its moral level is steadily declining; in the building trades in Paris wages have doubled since 1830, while the cost of living has risen only 40 per cent.; the large amounts of money deposited everywhere in savings-banks afford a good indication of this, especially when taken in connection with the evident and vast improvement in the standard of living.

Another assertion of the Socialists, closely allied with that just referred to, is to the effect that the earth could support a larger population if wealth were equally divided. With this also M. Jannet takes issue, saying that its best refutation is found in the rapid growth of the Western populations during the present century, when all barriers to the development of individuality were taken down, as compared with the slow increase of previous ages. He contends that modern luxury, being expended on manufactures, enables a larger population to live and to live better than would otherwise be the case; the demand for luxuries stimulates their production, and cheapens it to such a degree that they presently fall into the category of the necessaries of life and are brought within the reach of the humblest classes. He shows that, even in so glaring a case as the Scotch deer preserves, the keepers and other retainers who get their living from them outnumber the families of the crofters who formerly eked out a miserable existence by raising oats. He adds that the principal causes which prevent population from attaining its possible limits in our time are the expenditure of the masses for tobacco and alcohol, and the destruction due to the wars and the armed peace of modern Europe.

But then, how about the "capitalistic production" which Karl Marx and his followers denounce so violently? Here, too, M. Jannet is ready with facts and arguments. The essential things to be noted are that with the development of industry the share of the profit taken by capital goes on diminishing, while the total amount paid to the laboring class and the amount paid to each laborer go on increasing; that by the employment of costly machinery the productive power of the laborer is vastly multiplied, so that if he receives only one-third of the value of his product, he gets more than its whole value would be in a primitive system of industry; that while a small private manufacturer could not long afford to work at a loss, but would have to stop in bad times and throw his hands out of employment, the rich corporations of our day can and often do run their factories for years without paying dividends, although wages are paid all the time; large profits are now exceptional, and not more frequent than is necessary to tempt capital to incur risks. Karl Marx, however, asserts that a laborer produces in six hours the cost of his keep; the employer makes him work twelve hours and gives him no more than his keep; consequently, the employer robs him of half his earnings and lays it up in the shape of capital, which then goes on accumulating. In this sophism, says M. Jannet, everything is arranged at pleasure to exasperate the laborer, while the facts are quite different, as appears from a number of examples which he enumerates, but of which we can here reproduce only two. In 1888, an exceptionally prosperous year, the earnings of all the French coal mines produced, as dividends and reserves, 1.47 franc per ton, while the miners received 5.04 francs; so that if the laborers had received the entire product, their wages would have been increased 21 per cent., a little more than one-fifth. This would have left nothing for expenditures essential to keep the mines in working order for succeeding years, nor would allowance have been made for 127 mines worked at a loss, against 166 earning dividends, nor for contributions made by the companies to the benefit funds of their employees. In 1889 the railroads of the United States, watered as their stock is, paid in wages and salaries four times as much as in dividends and interest. If only those were kept running that earn more than their operating expenses, what would become of the army of workingmen whose families now actually live on the capital of the foreign stockholders? Evidently the calculation of Marx needs revision. Another consideration which M. Jannet enforces by statistics of the distribution of personal property in various countries is, that a preponderating portion of the great bugbear "capital" consists of the accumulated savings of small people, which, by the modern invention of joint-stock companies, are made available in productive industries. The conspicuous great fortunes, taken all together, form but a small proportion of the aggregate wealth.

Another socialistic bugbear is the "unearned increment," and this is subjected to a similar analysis by M. Jannet. Here, again, we can barely indicate the mass of illustrations which he brings in play. A considerable part of the apparent increase in the value of land in old countries is only on paper, and has only kept pace with the general rise in prices, which is but a disguised expression of the depreciation of the precious metals; another part is due to the decline in the rate of interest, and results from multiplying the annual revenue by a larger coefficient. According to Mr. Giffen, the selling price of land in England was eighteen times a year's rent in 1679, twenty-two times in 1766, and thirty times in 1880. Of the instances of great actual increase of land values cited by Henry George, many are due to the application of capital in reclaiming swamps, etc. The present revenue of landed property in Europe is less than the interest on the capital sunk in permanent improvements in the past 200 years. There is also another side to the question. Along with an increase of values in some places there has been a decided decrease in others. In New England, New York, and Pennsylvania the depreciation in farm lands during the last fifteen years is as high as 50 per cent. Buying real estate for

a rise is a legitimate speculation. To the charge that private ownership in land is founded on conquest and violence, M. Jannet replies that the present owners are in very few instances the descendants of the original conquerors. Since the tenth century the nobility of France, England, and Germany, with the exception of a very small number of historic families, has been entirely renewed at least three times. The class below the nobility renews itself even more rapidly. It is a physiological fact that families in the higher social strata are less productive than those below them, and tend to die out unless they intermarry with the latter. This process is continually going on, and tends to a fusion of races in each community, and to a downward diffusion of inherited wealth along with an upward diffusion of wealth acquired in trade.

Lack of space prevents even a mere mention of the many topics treated in this book with interesting historical and other illustrations. The functions of banks and of exchanges; the services rendered by speculation in affording a ready barometer of values and keeping fluctuations of prices within narrower limits than prevailed before existing systems were organized; the futility of legislative attempts to prevent or restrict dealings in futures and in options, as shown by their frequent failures and abandonments; the demonstration that legitimate commerce would be impossible without speculative contracts, that every owner of any kind of property has a right to hold it for a rise, while, on the other hand, those who sell commodities for future delivery act in the interest of the consumer by preventing an undue rise in prices; that combinations to raise prices unduly, unless supported by protective tariffs, are doomed to failure through the abundance of capital seeking profitable investments; that financial abuses can be better left to the operation of natural laws than remedied by special legislation—all of these matters and many others are more or less elaborately handled by M. Jannet. He gives accounts of the financial history of the seventeenth and eighteenth centuries, of the origin and present constitution of the stock-exchanges and clearing-houses of the world, as well as of such isolated occurrences as the rise and fall of the copper syndicate. He devotes a good deal of intelligent attention to American affairs. In regard to the silver question, he says that gold has become the universal international money, while silver is only the small change of rich countries and the interior circulating medium of poor ones, such as India, China, and Russia. No international agreement would avail to keep up a fictitious ratio between the two metals which does not respond to their actual relative value; and there is no prospect that the leading European States will ever agree to make the experiment. The constantly growing use of banking facilities and clearing methods enables the existing stock of gold to suffice for a much larger number of transactions than formerly, and there is no danger of a scarcity of money. For silver there is a wide field of usefulness in countries like China, where it has a great future in providing for the internal commerce of 400,000,000 of people.

M. Jannet's book would be most valuable for reference if it only had an index, but it may be recommended even for continuous reading. The next time he appears in print we wish him a proof-reader who can look after the spelling of American names.

SYBEL'S GERMAN EMPIRE.—II.

The Founding of the German Empire by William I. By Heinrich von Sybel. Translated by Marshall Livingston Perrin, Ph. D., of Boston University, assisted by Gamaliel Bradford, Jr. Vols. III., IV., V. New York: T. Y. Crowell & Co. 1891-92.

NAPOLEON'S whole attitude during the spring of 1866 is explained by his desire, primarily, to see war declared between Prussia and Austria, and, secondarily, to secure as even a balance of forces as possible between the combatants. Greatly overrating the strength of Austria and underrating the strength of Prussia, he believed that the support of Italy, or at least a military diversion on her part, was necessary to protect Prussia against overwhelming defeat; the more because the minor States of Germany were sure to side with Austria. It seemed to him not unlikely that Prussia would ultimately need France's help as well as Italy's, in which case French demands for compensation could not be refused. For this reason Napoleon seems to have been little troubled by his failure to obtain definite pledges from Prussia. He considered a decisive Prussian triumph impossible. When the impossible occurred at Königgrätz, he found himself in a position of great difficulty. Austria at once ceded Venice to France. She thought that Napoleon, with this province in his hand, would at least be able to quiet Italy, and she hoped that he would intervene actively in her behalf. Napoleon's Foreign Minister, Drouyn de Lhuys, advocated the latter course. He proposed at once to place 200,000 men on the German frontier and force Prussia to conclude peace on terms satisfactory to France. Lavalette objected: France had approved the alliance between Prussia and Italy, and it would be an act of bad faith to intervene against them. Moreover, the French Army was not in a condition to make such an intervention effective. Napoleon rejected the proposals of Drouyn de Lhuys and confined himself to diplomatic pressure upon Italy and Prussia. But Italy, her national pride stung by the defeat at Custozza and the offer of Venice as a gift from Napoleon, proved unexpectedly recalcitrant. She refused the gift absolutely, and marched into the disputed province. Prussia accepted the French offer of mediation, but declined to agree to any armistice until the terms of peace were settled. The Prussian troops were pushed energetically forward upon Vienna. Drouyn de Lhuys again made warlike proposals, which were again negatived by Napoleon. Goltz, the Prussian ambassador in Paris, opened negotiations with Napoleon touching the terms of peace with Austria. These negotiations ended in an agreement, two weeks after Königgrätz, that Austria should be excluded from Germany, but should lose no territory except Venice; that Prussia was to annex three or four millions of souls in North Germany, including Schleswig-Holstein, but not including Saxony; that all Germany north of the Main was to form a confederation under Prussian control, and that the South German States were to form an independent confederation. Napoleon recommended to Austria the acceptance of these terms, and on these terms the preliminary peace of Nikolsburg was concluded.

According to Von Sybel, Bismarck did not originally desire to annex so much North German territory. He would have been satisfied with a Prussian hegemony, provided it had extended over all Germany. But as Napoleon insisted on the independence of the South German States, Bismarck conceded this point. It was perfectly obvious that Napoleon expected to exercise a protectorate over Southwestern Germany, to create a new Confederation of the Rhine; but Bismarck was confident, and with reason, that he could defeat this scheme. In return for the concession of South German independence, Bismarck demanded and obtained the annexations in North Germany. In case Napoleon resisted these demands, Goltz was instructed to threaten that Prussia would proclaim the revolutionary constitution of 1849 and rouse all Germany to a national war. At the same time he was to sound Napoleon as to his willingness to accept compensations elsewhere than in Germany.

Bismarck did not find it easy to persuade King William and the military men to accept these terms of peace. They wished for annexations from Austria; they demanded at least a part of Saxony. But the European situation was critical. There was always the danger of armed intervention on the part of France, and there was also a prospect of diplomatic interference by Russia. The Czar, allied with many of the smaller German houses as well as with the Hohenzollerns, was growing restive. France was inquiring more and more impatiently just what her compensation was to be, and Russia was talking of a European Congress. King William finally yielded to Bismarck's representations and agreed to the treaty of Nikolsburg. But the anxiety of these weeks had been so tense that Bismarck's nerves were almost unstrung. When he returned to Berlin and took part in the triumphal entry, he looked like a man just risen from a long illness.

With the peace of Nikolsburg the fruits of victory were at least temporarily housed, but by no means secured. Fortunately for Prussia, Russia and France could not act in unison. Russia desired to protect the smaller German States, and for this purpose she naturally proposed a European Congress. France, however, desired advantages for herself which could not well be obtained from a Congress, and therefore declined to support the Russian proposal. Under these circumstances the Czar did not press the matter; and, receiving satisfactory assurances concerning his special protégés, Hesse-Darmstadt and Würtemberg, with pledges of Prussian support in the question of the Black Sea, he withdrew all opposition. The French demands for compensation were staved off as long as possible, Bismarck continuing his famous "dilatory" tactics. But when, on the 5th of August, these demands became categorical and were backed by threats, Bismarck as categorically refused them. The compensations asked for were the frontier of 1814, as against Prussia; the Bavarian and Hessian provinces on the left bank of the Rhine; the separation of Luxemburg and Limburg from the German Confederation and the withdrawal from Luxemburg of the Prussian garrison. In narrating the episode of August 5, a few years later, Bismarck said that Benedetti threatened war, and that he replied: "Very well, then war." French authorities have disputed the accuracy of this résumé of the conversation; Von Sybel maintains its essential correctness. According to Bismarck's notes, written immediately after the interview, he declared to Benedetti that if France insisted on her demands, Prussia would immediately conclude a final peace with Austria on terms more favorable to the latter Power than those of Nikolsburg; would take measures to unite all Germany; would throw 800,000 men across the Rhine and recover Alsace. The interview terminated without

any modification of the French demands, but they were immediately afterward withdrawn by Napoleon. He had been seriously ill at the time they were formulated; his assent had been extorted by his Foreign Minister, and he now repudiated the latter's action. Drouyn de Lhuys of course resigned his portfolio.

During this time Bismarck had been negotiating treaties of peace with the South German States. After thoroughly frightening them by demanding large cessions of territory and heavy war-indemnities, he let them off very easily, in consideration of secret compacts of offensive and defensive alliance—compacts which gave the command of their troops in case of war to the King of Prussia. By these arrangements Napoleon's schemes for a new Confederation of the Rhine under French protection were frustrated in advance, and a long step was taken toward the unification of all Germany. The advantages thus secured by Prussia far outweighed the alternative gains of territory which she abandoned; yet the abandonment of her original demands figured in the simultaneous negotiations with Russia as an important concession to the wishes of the Czar. In the negotiations with Bavaria, Bismarck used the French ultimatum of August 5, with dramatic effect. He had demanded from Bavaria the cession of her Franconian possessions north of the Main and an indemnity of 30,000,000 gulden. Bavaria appealed to France and received assurance of French support. Bismarck thereupon revealed to the Bavarian Plenipotentiary, Von der Pfordten, the fact that Napoleon had proposed, a fortnight earlier, to annex the Bavarian Palatinate. He then offered to abandon all cessions and to reduce the indemnity if Bavaria would accept the Prussian alliance—an offer which Von der Pfordten at once accepted with enthusiasm.

In this same anxious month of August, the final treaties of peace with Austria were under negotiation. There was more than one moment when a harmonious adjustment of the differences (between Austria and Italy especially) seemed doubtful; and at one of the most critical junctures new French demands for compensation made their appearance (August 20). This time it was Saarlouis, Landau, and Luxemburg, with the further suggestion that Prussia and France conclude a treaty of offensive and defensive alliance, guaranteeing to the former her German conquests and to the latter Belgium. Bismarck rejected the demand for Landau and Saarlouis, but dallied with the proposals concerning Luxemburg and Belgium until the situation cleared again and the treaty with Austria was signed (August 23). On the 29th of August Benedetti handed Bismarck a draft of the proposed treaty of alliance, providing for the annexation of Belgium. An immediate answer was not demanded, and no answer, it seems, was ever given. Napoleon had apparently discovered at last that Bismarck had been playing with him for two years, and that nothing was to be gained by further negotiations. The next important episode in the Franco-German diplomacy arose from the attempt of France, in 1867, to buy Luxemburg from Holland; but this falls outside the limit of Von Sybel's narrative.

Just before the outbreak of the Austro-Prussian war, Bismarck had injected into the controversy—by a sudden impulse, as it seemed then, but really in pursuance of a long-considered policy—the question of the reorganization of the German Confederacy. He proposed the direct election of a German Parliament by the German people. This was the dearest desire of the great majority of the nation, but no one believed that Bismarck's proposal was made in good faith. No one believed that the minister who had been ruling for nearly four years with only a small minority of the Prussian Diet on his side, could really mean to accord parliamentary power to the German people. But before the first shot was fired, Bismarck showed that the better constitution of Germany was not only a serious aim with him, but the very centre and soul of his policy. Schleswig-Holstein dropped into the background. When the Prussian representative in the Diet pronounced the old confederacy dissolved, he emphasized at the same time the essential unity of Germany, and declared it to be the purpose of his King to reëstablish this unity on new and firmer foundations. The ultimata sent to the minor German States called upon them to accept an alliance with Prussia for the formation of a stronger union with a popular parliament. During and immediately after the war, treaties to this effect were concluded with all the States north of the Main save those marked for annexation; and in 1867 a North German Parliament, elected on the basis of manhood suffrage, discussed, amended, and adopted the Constitution of the new Germany.

Before this Parliament met, Bismarck had closed the conflict between the Crown and the people of Prussia. In spite of the strenuous opposition of his Conservative friends, in and out of the Cabinet, the Prime Minister persuaded the King to ask the Diet for a bill of indemnity, covering the extra-constitutional action of the Ministry during the preceding four years. The result of this conciliatory measure was the disintegration of the parliamentary opposition; the formation of a new party, that of the National Liberals; and the creation of a working majority for the Government in both the Prussian and the German Parliament—a majority that remained substantially unbroken for the next ten years.

In estimating Von Sybel's sympathetic and appreciative delineation of the first four years of Bismarck's ministerial career, we should remember that during these years the historian stood in the front rank of the parliamentary opposition. To readers familiar with the history of the period, no explanation is necessary either of Von Sybel's opposition then or of his approval now. No German who was at once a Liberal and a Unionist, as all the best intellects and warmest hearts of the generation were, could at that time support Bismarck. They could not dream that the Tory Squire whom the will of the King had placed at the head of the State was destined to realize their aims. They knew nothing of the now famous Frankfort despatches; they did not know how Bismarck had chafed for years under the Austrian pretensions; they did not suspect that he had outgrown the traditions of the Holy Alliance. They opposed him because they did not understand him; and as it was impossible for him to reveal his real aims, they continued to oppose him until they suddenly awoke to the fact that he had been doing their work in the teeth of their opposition. To this group Von Sybel belonged, and this is the story of his change of attitude. But it is nevertheless remarkable that he has been able to write the history of those years with such objective calmness. Some of the men who stood at his side in the Opposition, and who after 1866 went over with him into the new governmental majority, still maintain that the solution of the German question by their old enemy was an afterthought; that Bismarck's prime object was to strengthen the royal authority and destroy every vestige of constitutionalism in Prussia; and that it was only because he had got himself and the King into a blind alley that he fought Austria and unified Germany. We are not surprised that Von Sybel gives no countenance to this conception of Bismarck as statesman *malgré lui;* but it is remarkable that he has so completely suppressed the natural impulse of self-justification, particularly when the justification is so easy. He so nearly effaces himself that even a careful reader, if unacquainted with the German politics of that day, would hardly suspect his attitude prior to 1866. Only in one or two instances, where it is a matter of historical record, does his name appear, and then without comment.

There is nevertheless one point in which it seems to us that Von Sybel's presentation of Bismarck's diplomacy takes color from the historian's earlier point of view, when Bismarck was supposed to entertain the customary Tory predilection for Austria. During the years preceding the armed conflict, Von Sybel represents Bismarck as hesitating, with an open mind, between three lines of policy: that of ruling Germany conjointly with Austria, that of dividing the hegemony by a geographical line, and that of expelling Austria from Germany. There is doubtless much evidence in Bismarck's own despatches and reports to support this theory, and it accords admirably with the progress of events. During 1863 and 1864 Prussia and Austria did, as a matter of fact, rule Germany jointly. As often as the harmony of their joint rule was disturbed by the underlying antagonism of their real interests, the idea of a divided supremacy crops out—notably in the suggestions of Gablenz, which, as we have seen, Bismarck approved. But it seems to us that there are strong reasons for taking a different view of Bismarck's ultimate aims—of his esoteric policy, if we may use the expression. It may well be, as Von Sybel declares, that at a given moment Bismarck would have preferred a smaller measure of success in concert with Austria to a greater measure in opposition to that Power; but this is only saying that he would have taken a smaller gain without the cost and risk of a war. It is always to be borne in mind, too, that Bismarck had to do everything with and through the King, and that King William unquestionably had a strong predilection for Austria and preferred the Austrian alliance to any other; that it was with keen regret that he saw the breach between Prussia and Austria widen in 1865 and 1866; that it was with great difficulty that he was brought to accept the Italian alliance and the war. The principal facts, however, which it is not easy to harmonize with Von Sybel's theory are the express and unreserved declarations of Bismarck himself. Before he became Minister-President he had said, in his Frankfort despatches, that Prussia's justifiable ambitions could not be realized in concert with Austria, or without a victorious contest with Austria. In a speech before the North German Parliament, March 13, 1867, he stated that he had formed this opinion while he was at Frankfort. In 1850, he said, he entertained the hereditary political views of all Prussian Conservatives; but when he got "behind the scenes" at Frankfort, he discovered that the traditional policy of concert with Austria was "impossible." It does not seem probable to us that Bismarck changed his views in the period between these declarations. It looks a great deal more as if he had been engaged, during the first

years of his premiership, in educating his monarch up to his own point of view; in showing King William, by actual experiment, that concert with Austria was indeed impossible; and in so shaping facts that their logic would be decisive where his own arguments were inadequate.

It is not impossible that our author is unconsciously influenced, in his treatment of this question, by the existing political interests of his country. The alliance with Austria is today so vital a part of Germany's foreign policy, that it is not easy for a German historian to set forth the historic antagonism between Austria and Prussia in all its bluntness. There is a natural tendency, in the interest of present harmony, to attenuate the older differences.

Von Sybel's fifth volume brings the narrative, as we have said, down to the end of the year 1866. In a sense the work finds here a natural close, for the Empire was really "founded" at that time. When the South German States came into the new union, and its name was changed from Confederation to Empire, there was no essential change in the constitutional organization. But there are indications in the structure of the fifth volume that the author does not intend to close his work definitively at this point. The narrative is arrested rather than rounded off; and with a writer of Von Sybel's literary instinct the difference is significant. Let us hope that the public may look forward to further volumes setting forth the history of the years from 1867 to 1871 with the fulness, clearness, and finish which characterize the present work.

Of the demerits of the translation we expressed our judgment in reviewing the first two volumes; and we can find, unfortunately, no reason to modify our opinion. The translators do not know the technical vocabularies of German law and politics. They seem to be aware of their ignorance, indeed, for we observe in these later volumes an increased tendency to avoid the translation of technical terms, even where there exist substantial English equivalents, and to substitute vague circumlocutions, in phrasing which they are commonly guided by the context. When not embarrassed by this difficulty they show a fair acquaintance with the German language and its ordinary idioms, and the mistakes which they make seem due to haste and carelessness.

Memorials of Edinburgh in the Olden Time. By Sir Daniel Wilson, LL.D., F.R.S.E., President of the University of Toronto. 2d ed. Edinburgh: Adam & Charles Black; New York: Macmillan & Co. 2 vols. Pp. xxii, 282; xiv, 316.

THESE very handsome volumes come into the world under peculiar circumstances. More than fifty years ago the author, then a young man, began a series of notes accompanied by drawings of such ancient memorials of the Maiden City as time and vandalism called Improvement had spared; the worst vandalism, called Restoration, was then just beginning. He tells us that when a publisher was found to take the burden of introducing his book to the world, he cheerfully contributed to the loss, under the supposition that he was retaining the copyright; caused a copy to be interleaved, and began filling it with fresh drawings and notes, with a view to a second edition. He was just about to prepare the latter for publication when, to his utter surprise, he found the copyright had expired, and an unauthorized reissue was on the market, with editorial notes purporting to point out such changes in the city as had taken place since the original edition, but often falling absurdly short of such an engagement.

Not only thus, but the edition of 1847 and the authorized reprint have been freely drawn upon by later writers on Edinburgh almost as a work inspired, and the very blunders perpetuated as history or at least immemorial tradition, to the great amusement of the venerable President. Misled by an heraldic ornament in St. Giles's Cathedral, he had formed the inference that the aisle where it stands was erected as an expiatory memorial to David, Duke of Rothsay, whose horrible fate is familiar to readers of the 'Fair Maid of Perth'; he even ventured to construct for it the romantic and legendary name of the Rothsay aisle. Subsequent study has convinced him that his conjecture had no sound basis. But other writers, carried away by the ingenious presentation of the former view, have transferred the romance to the region of fact, and spoken of the structure as traditionally called the "Rothsay aisle," a name which Sir Daniel assures us cannot be found earlier than his edition of 1847. In like manner, he allowed his fancy to wander into various ballad versions of events in Edinburgh annals, of no more historical force than Macaulay's "Armada" or Drayton's "Agincourt"; but these again duly appear interwoven with contemporary accounts as traditionary ballads.

The two beautiful and not too costly volumes of the new edition are enriched not only by the author's latest observations, corrections, and drawings, but by treasures from other sources, duly acknowledged, particularly the very characteristic pencillings of that caustic genius, Charles Kirkpatrick Sharp. Antique plans and views also occur, and the crowning mercy of an index is not wanting. We deeply regret that space does not allow us to make extracts from this beautiful and authentic treatise. The author, surviving both pirates and plagiarists, and in an honored old age presenting these noble volumes not only to his countrymen, but to all who love the "streets of High Dunedin," has, even while this notice was preparing, passed beyond the reach of congratulation. Every cultivated man, every well-read woman, nay, in decently regulated countries, every intelligent child, has an Edinburgh of his own; and each and all will find something for themselves in Sir Daniel Wilson's book.

Phases of Animal Life Past and Present. By R. Lydekker, B.A. (Cantab.). Longmans, Green & Co. 1892. 8vo, pp. 248, illustrated.

FEW writers are as competent as Mr. Lydekker for work like this, a series of essays, in popular style, treating of the animal life of the past and of the present, with their relations to each other and to the questions of origin. These articles were first printed in the pages of *Knowledge*, from which they are reproduced with some modification and additional illustrations. They relate to vertebrates almost entirely, and are but indirectly connected by their evolutionary bearings. Each is complete in itself; together they form a strong addition to the literature of descent.

Because of its real merit the book deserves popularity. Little can be urged against it by those who favor particular theories, since no prominence is given to theoretical considerations. How the different theories are regarded is not easily determined. Apparently the author, with most osteologists and palæontologists, recognizes in use, disuse, habits, surroundings, etc., factors of more importance than the selection of Darwinians. Some mystification arises from the use of *for*, where others might use *by*, as in the case of an organ modified for a particular purpose, an animal modified for a life in the water, organs originally modified for a purpose (flight) subsequently undergoing a kind of retrograde modification for a totally different use, some that undergo structural alteration simply for the purpose of swimming, and others that are gradually more and more modified for the exigencies of a purely marine life. There are traces of a belief in plan or purpose preceding the fact, or of belief in special interpositions. Cetacea are said to have been developed to fill the gap left in the life of the ocean by the Ichthyosaurs and Plesiosaurs. Mention is also made of aquatic habits acquired so recently that they have not had time to induce any strongly marked structural peculiarities, and of resemblances between Ichthyosaurs and whales that are to be explained by their similar conditions of life.

The subjects are varied, but the tendency in all is to set forth modifications and to trace lines from the early extinct to the living forms. The comparisons with which the work abounds give it a value much beyond that of an interesting statement of facts. In single chapters the range is considerable: that on mail-clad animals discusses fishes of various times and kinds, crocodiles, tortoises, glyptodonts, armadillos, and pangolins, and that on flying animals deals with insects, fishes, reptiles, birds, and mammals; a proper distinction being made between the spurious flight of fishes and the true flight of birds. Occasional expressions might profitably be changed. Flying squirrels are said to make a sharp, squeaking cry, and phalangers to be silent, during flight. We can confirm the squeaking of the squirrels when several desire to keep together, but not when a single one is desirous only of escape. Egg-laying in monotremes is treated as if a recent discovery. The advantage of the upright position and leaping progress of the kangaroo is said to be that the young can be more safely carried in the pouch. "An advantage" would be better in this place; as it stands, the implication is that the erect posture and leaping gait were taken on simply for the purpose, as the author would say, of keeping the young from falling out. A neat protest against needless disturbance of nomenclature appears in the statement, "It may be worth mention that some of those naturalists who are never satisfied with a name, unless it be one for which they are personally sponsors, have proposed to replace the well-established name of labyrinthodonts by that of stegocephalians, or roof-skulled saurians—a term sufficiently appropriate if no earlier one had barred the way to its adoption." A doubtful attempt is made to fix the name turtle upon marine species and restrict the name tortoise to land forms. Turtle is usually looked upon as a corruption of tortoise; as such, its synonymous use has become so firmly established that change is hardly possible. To follow the author, we get our tortoise-shell from turtles, and much of the turtle-soup from tortoises. All of the snapping-turtles become tortoises. The confusion in these names began three centuries or more ago. Early in 1600, tortoises, turtles, and turkles were terms used in referring to the same species. Tortoise, however, would seem to have official recognition for the marine forms, as is seen in an act of 1620 "Agaynst the killinge of ouer young Tortoy-

ses." "Semblably, tortoises live in two places, and haunt both land and waters" (Holland's Pliny, 1634, 'Nat. Hist.,' ii, page 431).

Selections from Lucian. Translated by Emily James Smith. Harper & Brothers.

EVERY now and then somebody born to the English tongue rediscovers Lucian, to the amusement of those to whom Lucian is a familiar spirit; and almost always that somebody makes the public pay to witness the rediscovery. Sometimes it is an edition for the fabrication of which nothing later than Reitz is used. Sometimes it is an essay such as Mr. Froude wrote when he stumbled on "Alexander, or the False Prophet," and found out that there were Cagliostros in the second century. Sometimes it is a volume of "Ancient Classics for English Readers" in which "the original Latin" of Suidas is cited and extraordinary liberties are taken in the rendering of Lucian's original Greek. A few years ago we had occasion to notice a poor translation of some of Lucian's dialogues, and now we are favored with a dainty volume of 'Selections from Lucian' by Emily James Smith, whom one would be only too happy to accost with the civility of a prefix in accordance with Mr. Andrew Lang's precept and example, if one were able to divine whether it is maid or matron who has undertaken the task of rendering some of Lucian's riskiest pieces and stepping daintily, after the manner of an egg-dancer, over the improprieties of the "Cock" and the "Ass."

The translatrix knows her Greek well enough to do this—knows it better than some of her masculine rivals. An idiom is pretty sure to call forth an idiom, the airy tone is well preserved, and the success in putting the direct Greek into conventional English is sometimes remarkable. Only to those who know the original the success sometimes comes perilously near to a double meaning, and a double meaning is much worse than calling a spade a spade, if one may use a trite saying to which Lucian himself gave currency. But even the "Lysistrata" of Aristophanes has been translated into language that would not shock the most fastidious, so that the feats of this translatrix cannot be regarded as unparalleled *tours de force*, especially as she has availed herself of the right "to omit words, sentences, or even whole passages that would offend modern taste." That the audacious "Ass" had to be cut and not bridled merely, is not surprising, and even the merry "Cock" had to be mutilated towards the end; but in the latter piece, by a sad slip, reference is made to the omitted scene, and the reader without the Greek before him or the Greek in mind must be sorely puzzled by the allusion "to the wealth of Eukrates," whose improper conduct has been unceremoniously suppressed.

The enormous literature that has gathered about Lucian, the translatrix treats in the same airy fashion in which she accosts her main task. She gets rid of the question of Lucian's Greek by comparing it with the *pastiche* of 'Henry Esmond,' or 'The Master of Ballantrae' — an utterly misleading comparison; and she has very little patience with "footsore Erudition," the egg-dance aforesaid being much more to her taste. She laughs at Jakob's "diverting attempt to wrap Lucian in respectability," as she would doubtless laugh at the thought that there was any meaning under the fooleries of Rabelais. Croiset she knows, or knows of, but maliciously spells him with a *z*, and makes her selections at her own sweet will, Croiset permitting or not. The "Halcyon" she includes, though "the critics regard [it] as probably not by Lucian," but she does not deign to notice that the authorship of "Loukios" is hotly disputed, and that Rohde "has been forced to abandon the defence of the Lucianic or "Loukianic" origin. In "Toxaris" Lucian is hardly at his best, to say the least; but that is a matter of taste. Like most of those who have dipped for the first time into the literature of the second century, the translatrix has overestimated what she calls "the enormous reading" of Lucian. One of the most remarkable things about the Greek Renaissance is the limited range of reading, which even then seems to have been made up of "Elegant Extracts." But the translatrix might invoke the authority of Kock, who thinks that Lucian is a mosaic of disjected lines from the lost comic poets, and no lover of Lucian would like to have a controversy with one who enjoys her author so thoroughly as does the translatrix of the 'Selections from Lucian.'

Leone X. e la sua Politica. Florence: Barbèra. 1892.

IN this volume Francesco Nitti presents the results of his investigations among hitherto unpublished documents and correspondence of the Medicean period. His purpose is to unravel, first, Leo X.'s policy towards Lorenzo and Giuliano de' Medici, and, second, that pope's intrigues in the contest between Charles V. and Francis I. for the supremacy of Europe. Both of these matters have been the cause of great difference of opinion; indeed, the posthumous reputation of Leo X. has suffered almost as many vicissitudes as has that of Scottish Mary or Henri Quatre. Up to the early part of this century, it was usual to extol him as a modern Augustus, under whose wise and ardent patronage arts and letters flourished; then his vices and selfishness were made prominent by historians; and, finally, Signor Nitti comes to show how Leo, in politics at least, had higher aims and more shrewdness than his disparagers have hitherto allowed. According to Signor Nitti, dynastic ambition was not the foremost motive of Leo's career. Admitting that he threw the weight of his office on the side of his brother Giuliano and his nephew Lorenzo in their efforts to establish themselves at Florence and Urbino, it is still possible to construe this interference as the expression of Leo's desire to extend the power of the Papacy—an assumption which has stronger confirmation in his dealings with Charles and Francis. His course throughout the famous election of the Emperor in 1519, and his subsequent secret compact with Charles, display considerable political acuteness, and seem to have been actuated by his loyalty to the institution of which he was the guardian. So long as there was doubt whether France or Spain would win the ascendant, Leo played fast and loose with both; but when he saw that victory was turning towards Spain, he sided with Charles, in the hope of securing the support of the destined master of Christendom. Signor Nitti hints that Leo expected to free Italy from the domination of both France and Spain, and thereby to strengthen the grasp of the Holy See upon the Peninsula.

This book deserves to be read by every one who realizes the importance of the first quarter of the sixteenth century as a turning point in the politics of modern Europe. From that time dates international diplomacy; from that time appear, vaguely but surely, the theory of the European equilibrium, the attempt on the part of the chief European nations to prevent any one Power from lording it over all the rest. It was the epoch when statesmen, in the modern sense, sprang up: Maximilian in Germany, Francis and his astute father-in-law, Louis XII., in France; Charles V., in Spain; Wolsey, in England; Julius II. and Leo X., in Italy. Machiavelli dissected with a surgeon's dexterity the principles underlying that statecraft, and Signor Nitti now furnishes evidence that Leo X. was not the least subtle in that remarkable group. It would have been well had he printed in an appendix the most important of the unedited documents upon which he bases his argument, but as he promises to publish them in a separate volume, readers may soon have a chance to examine them for themselves. One other improvement we would suggest for his next edition: he should give not merely the title, but the volume and page of the authorities to which he refers in his footnotes. His work seems sufficiently noteworthy to warrant its translation into English.

Games, Ancient and Oriental, and How to Play them; being the Games of the Ancient Egyptians, the Hiera Gramme of the Greeks, the Ludus Latrunculorum of the Romans, and the Oriental Games of Chess, Draughts, Backgammon, and Magic Squares. By Edward Falkener. Longmans, Green & Co. 1892.

WHOEVER shall undertake a general history of games will find this book of Mr. Falkener's most useful. Just what it contains can be seen from the elaborate title-page. Its chief interest lies in the fact that the author believes that he has discovered how the Egyptians, Greeks, and Romans played certain games which have hitherto puzzled all students. There is an element of conjecture in his reconstruction, of course; but his argument is convincing, and he has at least devised a working hypothesis, for he has made out a game which it is possible to play with interest, "which satisfies the conditions of the texts and of the paintings and sculptures," and which is unlike existing games, although akin to them. He gives the rules for playing *ludus latrunculorum*, the game of *senat*, the game of the *bowl*, and the game of the *sacred way;* and a fly-leaf informs us where the boards and men may be purchased for those of us who shall desire to gamble as the Egyptians gambled full five thousand years ago. Now that the very old game of *parcheesi* has been revived, there is no reason why *senat* should not also find popular favor again.

Many of Mr. Falkener's chapters are enriched with brief bibliographies, an excellent characteristic of the book. Like most British bibliographical work, however, these are deficient in references to American authorities. In the bibliography of magic squares, for example, there is no mention of the late President Barnard's writings on the subject contributed to a Columbia College periodical. But in discussing *senat* Mr. Falkener gives due credit to Dr. Carrington Bolton for his investigations. Mr. Falkener's book is abundantly illustrated with woodcuts and with photographs, both of the ancient games and of the Oriental. Especially interesting are the illustrations which accompany the paper on *parcheesi*. Chess-players will find much that is new in Mr. Falkener's discussion of the methods of playing this most fascinating of games—in China and in Japan, in Burmah, in Siam, and in India. Altogether, his essay can be recommended to all who are interested in the subject of it.

BOOKS OF THE WEEK.

Barrie, J. M. An Edinburgh Eleven: Pencil Portraits from College Life. Lovell, Coryell & Co. $1.
Black, G. A., and Carter, K. Natural History Lessons. Henry Holt & Co. 54 cents.
Caine, Hall. Capt'n Davy's Honeymoon: A Manx Yarn. Appletons.
Collins, Mabel. Morial the Mahatma. Lovell, Gesterfeld & Co. $1.25.
Cox, Mrs. M. McI. Jack Brereton's Three Months' Service. Boston: D. Lothrop Co. $1.25.
Dickens, Mary A. Cross Currents. Appletons.
Dumas, A. The Count of Monte Cristo. M. J. Ivers & Co. 25 cents.
Gordon, H. P. The Land of the Almighty Dollar. Frederick Warne & Co. $2.50.
Hardy, G. E. Five Hundred Books for the Young. Scribners. 50 cents.
Hyde, W. DeW. Practical Ethics. Henry Holt & Co. 89 cents.

HENRY HOLT & CO.

PUBLISH THIS WEEK:

VON JAGEMANN'S

Elements of German Syntax.

With Special Reference to Prose Composition. By Prof. H. C. G. von Jagemann of Harvard. 12mo, 176 pp. Teachers' price, 80 cents; by mail, 89 cents. The treatment of German syntax is from the point of view of the English language, and based upon the difficulties which, in the author's experience, pupils translating German into English have most often met.

HAVE JUST PUBLISHED:

SHAW'S

English Composition

By Practice. On an inductive plan. By Prof. Edward R. Shaw of the University of the City of New York. 12mo, illustrated, 215 pp. Teachers' price, 75 cents; by mail, 83 cents. Attractive stories and sketches are first studied, and the pupil led to observe the application of the simplest principles of composition. Rules are formulated on the basis of this observation.

JOHNS HOPKINS UNIVERSITY

BALTIMORE.

Announcements for the next academic year are now ready and will be sent on application.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make collections and issue Commercial and Travelers' Credits, available in all parts of the world.

The Nation.

NEW YORK, THURSDAY, AUGUST 25, 1892.

The Week.

IT is a fact of common experience in this country that a switchmen's strike is the ugliest of all strikes and the one most difficult to deal with. The Buffalo strike has been in keeping with all that we know about these affairs. The New York Central switchmen "went out" not because of any grievance of their own, but because the others went out. The Buffalo and Pittsburgh men struck and the company acceded to their demands, but they refused to go to work until the Erie and Lehigh Valley Companies should yield to their men. All this would be endurable if the men would go about their business and leave other people and other people's property alone. But this they will not do. No sooner do they "go out" than they organize themselves as brigands, and proceed to burn and wreck and kill and maim wherever an attempt is made to operate the roads that they have abandoned. They must be put down, they must be made to suffer the consequences of their riotous acts, but that ought not to be the end of the affair. These railroad interruptions ought to be made impossible. So many interests are affected by a stoppage of traffic that the State ought to intervene in some effectual way to insure the continuous and regular movement of trains. The Railroad Commissioners of this State pointed out the need of such legislation several years ago, and showed the equity as well as the necessity of it. Of course, men cannot be compelled to work on railways more than in factories against their will, but they can be, and should be, required to give reasonable notice of their intention to quit, so that their places may be filled and the movement of traffic continued. The employers should be equally required to give notice of intention to "lay off" any hands in their employ. Railway and telegraph service should be made subject to army discipline, the obligations being mutual between employer and employed. *A fortiori* the forcible stoppage of trains by hands who have discharged themselves from service without a moment's warning, and even after their demands had been complied with, should be dealt with in the most summary manner with all the power of the State.

President Harrison's proclamation fixing a toll of twenty cents per ton on Canadian freight passing through the Sault Ste. Marie Canal is moderate in tone and also in the amount charged for the transit. The Canadian Government appears to have been in fault with respect to the British Legation at Washington, as well as in other ways, for the Chargé, Mr. Herbert, was not informed of the decision to continue the rebates till the end of the present season until our Government had obtained the information from our Consul-General at Ottawa. This is all the more remarkable since Mr. Herbert was using all diligence to obtain the facts for both his own use and that of Secretary Foster. The Canadian Government has behaved like a coterie under the control of Montreal shipping merchants, and yet anxious to avoid an international difficulty, the result being a sort of "confession and avoidance." If the rebates are justifiable under the treaty, there is no reason why they should be abolished at the end of the present season. If they are not justifiable, there is no excuse for continuing them till the end of the season, and no reason for doing so except to put money in the pockets of the Montreal shippers aforesaid. It is still possible for the Canadian Government to solve all difficulties by either abolishing the rebates to Canadian vessels, or giving the same rebates to American vessels during the remainder of the present season of navigation. The only objection to this course apparently is that it would be another confession that they were in the wrong. But having made one such confession when they proposed to change their policy at the end of the season, the additional one can make no great difference. The season of navigation on the Canadian canals ends on or before November 15. Consequently there is but little more than two months' winnings for the Montreal shippers in any case. Is it worth the while of Premier Abbott to have trouble stirred up and to run the risk of a rebuke from the home Government for so small a mess of pottage?

Judge McCormick of the United States Circuit Court, sitting in Texas, gave a decision on Monday of very great importance to the railroads and to all the inhabitants of the country. The decision denies flatly the assumed power of a State Legislature to regulate rates of freight and fare through the mediumship of a board of railroad commissioners, if by such regulation the rates are made so low that the company cannot pay its own debts. Such regulation is held to be a law impairing the obligation of contracts. The text of the decision is not before us, but its practical import is to make the courts judges of the fact in question, whether the rates fixed by the Railroad Commissioners are too low for the purpose or not. It is evidently based upon the decision of the Supreme Court in the Minnesota cases. The State of Texas has been in a seething condition for some years on the subject of railway charges. Distances are great, population sparse, and railway operation costly. The only thing in the railway situation of which there is an over-supply is demagogues. These, headed by ex-Senator John H. Reagan, procured the passage of a law in April, 1891, creating a Railroad Commission of which Reagan became the leading member. The Commissioners were empowered to establish rates, and, since they represented only one of the parties to the bargain (the shippers), they put the rates low enough to satisfy their constituents. The railroads applied first to the Commissioners for relief, and of course got none. As they could not bring an action in the United States courts directly, the trustees of certain mortgages, representing non-residents, brought suit for an injunction to restrain the Commissioners from enforcing their arbitrary rates, upon the ground that such enforcement would disable and prevent the companies from meeting the interest on their bonds. The injunction was issued on Monday according to the terms of the petition.

Evidence accumulates that the Republican managers want to unload the Force-Bill issue, and are experimenting to see if they can do so. Last month Henry Cabot Lodge, who gave his name to the proposed legislation on this question in the last Congress, delivered his opening speech of the campaign—a long, elaborate, and carefully prepared address—and said not one word on the subject. On Wednesday of last week ex-Speaker Reed delivered his first speech of the campaign at Portland, and while he was voluble enough regarding silver and the tariff, he was as silent as the grave about the Force Bill. These are extraordinary performances on the part of such men as Lodge and Reed, and very short-sighted as well. Such silence does not help the case of the Republicans at all, because nobody believes for a moment that it signifies anything beyond their desire to deceive the public. Lodge, and Reed, and the rest of them might much better stand up like men.

The ex-Speaker had some very blunt and contemptuous references to those ingenious and latter-day "McKinley-prices" editors and orators who are trying to make out that the higher tariff lowered prices. He frankly gives it as his opinion that what has "kept prices down" is the "fact that the greediness of importers overstocked our markets." But he thinks the manufacturer ought not to give up hoping for higher prices, inasmuch as he "knows that the goods cannot be imported at such large profits hereafter, and therefore he will have more chance for the American market." At the same time, Mr. Reed warns the manufacturers that the "thing of all things desired by the human being is lower prices," and that

those prices are bound to come in the long run. But he makes no pretence that a high tariff will be their cause, which he very sensibly finds in "human ingenuity harnessed to business" and the "competition of the United States with the whole world." With great emphasis he assured his hearers that in that competition lay their "certainty of lower prices and higher wages." It would be interesting to learn from Mr. Reed, in one of his franker moments, his real opinion of the tariff which destroys that competition, so far as possible, and which therefore, on his own principles, must tend to produce high prices and low wages.

Senator Hoar says in his campaign letter from Paris that the Democrats deny in their platform the existence of any power in the Government to help manufacturers. Oh, no. There is a manufacturer well known to Mr. Hoar who says that he should be greatly helped by a repeal of the duties on coal and iron ore. His name is Ames. He was Governor of Massachusetts a few years ago, and is now a leading Republican politician. There are several hundred manufacturers in Massachusetts who agree with ex-Gov. Ames on this point. There are others who say that a repeal of the duties on wool would assist manufacturers. Congressman Stevens is one of these. Senator Hoar knows him very well. Now, the Democratic party offered to help manufacturers during the recent session of Congress by repealing the duties on wool, but Mr. Hoar and his allies in the Senate would not even consider the bill. Is not Mr. Hoar as big a tariff humbug as he is a Force Bill humbug?

The Democratic Convention in Iowa on Thursday was large, enthusiastic, and harmonious, indicating that the party is still in as hopeful a condition as when it carried the State in the last two elections for Governor. No Governor is to be chosen this year, but several minor State officers are to be elected. The most important State issue is still the question of regulating the liquor traffic. The Republicans are trying to dodge it by making no reference to the subject in their platform, in pursuance of a policy of silence which has been adopted by the managers throughout the West. On the other hand, the Democrats pronounce again for the doctrine of license and local option, and pledge themselves to the enactment of laws which shall give the people in their respective localities the management and control of the liquor traffic. It is much more creditable for a party to have a definite policy on such an issue, and it will be strange if it does not prove more advantageous also. On the tariff issue in national politics the platform is equally outspoken and emphatic.

Chief-Justice Morse of the Michigan Supreme Court, whom the Democrats of that State have nominated for Governor, is a man well qualified for an executive position, but it may be doubted whether it was good policy for the party to take its candidate from the bench. The Constitution of the State provides that no judge of the Circuit Court shall be eligible to any other than a judicial office during the term for which he is elected, and for one year thereafter, and that all votes given for such judge for any such (inhibited) office or appointment, whether by the Legislature or the people, shall be void. No mention is made of Judges of the Supreme Court, but of course every argument which applies to the lower court has equal weight in the case of the higher; and while there is no legal prohibition of Mr. Morse's candidature, it is morally forbidden by the plain intent of the framers of the Constitution. The feeling against going to the bench after a nominee for a non-judicial position is very strong in this country, and seems to be growing stronger. It is not wise for a party to fly in the face of it.

The *Iron Age* publishes a table, which it has obtained from Senator Carlisle, showing the cost of production and the selling price of tin plates in Wales during the years 1887–1891 inclusive. It appears that the cost of production ranged from 11s. 10d. to 13s. 4d. per box, showing an extreme variation of 1s. 6d., but the selling price ranged from 12s. 6d. to 17s., a variation of 4s. 6d. The great rise in prices took place in the latter part of 1890 and the beginning of 1891, when the maximum figure of 17s. per box was reached. This was caused by the rush of American buyers to get stocks accumulated before the McKinley tariff should take effect. During the twelve months ending June 30, 1891, there were shipped to the United States 9,259,490 boxes at the advanced prices. The average advance above the normal quotation could not have been less than fifty cents per box during that year. In other words, the McKinley Bill turned an extra profit of at least $4,600,000 into the pockets of the Welsh manufacturers in one year's time at our expense. These manufacturers showed no more inclination to divide the profit with their workingmen than ours do. The rate of wages remained unchanged till the middle of 1891, when there was an advance of about 10 per cent.

A correspondent inquires what proportion of the tin plate used in this country is made here at the present time. None, we think. About 1 per cent. is the figure if we count as American tin plates the British black plates imported and tinned here. The importation of these plates in the whole year ending June 30, 1890, before the McKinley Bill went into operation, was only 2,298 pounds. It shot up to 5,418,522 pounds in nine months ending March 31, 1892, and during this time the Treasury Department reported a manufacture of 5,240,830 pounds of American tin plate, showing that there remained at that time 177,722 pounds of British black plate to be tinned. The duty on black plate is $1.65 per 100 pounds, while on tin plate it is $2.20 per 100 pounds. This affords a fine chance for profit, at the expense of the consumer, since tin-plate dipping is scarcely more complicated than dipping one's self in the ocean on the Jersey shore. The annual consumption of tin and terne plates in this country is about 680,000,000 pounds, and the tax paid on it either to the Government or to private individuals is close upon $15,000,000.

The imagination of the public is from time to time dazzled with figures showing the enormous return upon money invested in land in the city of New York a generation or two ago—figures over which the disciples of Henry George writhe in agony. These calculations, however, generally fail to take into account the deductions which have to be made from such returns. Thus a real-estate journal recently stated the case of four lots, three of which were bought in 1852 for $4,500, and the other in 1860 for $2,550, a total of $7,050. They are regarded as now worth $40,000 apiece for the three inside lots, the corner being worth considerably more. The property, however, has been, we judge, wholly unproductive, and if any one chooses to calculate what $7,000 would amount to during the period covered, if invested at compound interest, and to add to this sum the amount of the taxes and assessments paid, also with compound interest, it will appear that the occupation of owning land is not attended with such exceptional profit as is frequently represented. Considering the high rates of interest prevalent until recently in this country, and the expensiveness of our city government, it is speaking within bounds to say that unproductive land ought to have increased from 10 to 12 per cent. in value every year to have been as profitable as other investments.

A cable telegram says that the British delegates to the International Monetary Conference are instructed not to discuss any proposals which involve a change in the monetary system of England, nor to give their assent to any plans whatever, without the assent of the Government. The scope of their powers is limited to proposals under which India might join an influential group of States in adopting bimetallism at a fixed ratio. In case such an arrangement should be effected, the Bank of England would be advised by the Government to keep one-fifth of its legal reserves in silver, as its charter authorizes. These preliminaries are almost identical with those with which England entered the conference of 1881. They are absolutely null as regards any participation by England herself in bimetallism. They foretell the failure of the Conference, because Ger-

many, who looks upon the whole thing as a bore, will say that she can do nothing without the coöperation of England, and Austria will say that she can do nothing without the coöperation of Germany, and so on. The Conference will then naturally fall back on Senator Jones of Nevada, who will, no doubt, go prepared for any emergency.

The reported dissatisfaction of the Radical wing of the Liberal party with the make-up of Mr. Gladstone's Cabinet appears to have no real justification. Mr. Gladstone again and again pledged himself in Parliament and in his campaign speeches to give home rule the first place in the Liberal programme, and if any body of voters supported him on the understanding that he would not do what he had promised, they have only themselves to thank for their disappointment. The surprising and tricky thing would have been the choice of a Cabinet which was not constituted primarily to carry home rule. Moreover, the Radical Liberals who want to see reformatory legislation for England—revision of the electoral and land laws, for example—have no reason to complain of the assurances given them by the new Prime Minister in his speech on the no-confidence motion the other day. He said as plainly as possible that he would not consent to the dissolution of Parliament until, in addition to the passage of a home-rule bill, it had given due attention to important measures of reform for England. It thus comes down simply to a matter of the offices and "recognition," and we should say that the Radicals could not afford to put themselves in the attitude of caring more for some figure-heads in the Cabinet than for the particular items of reform legislation which they are in a fair way to secure as it is.

Aside from the home-rule bearings of the personnel of the Cabinet, the most important appointment is that of Earl Rosebery as Foreign Secretary. It is likely that many delicate international questions will confront the new Government, and it is essential that the foreign policy of the United Kingdom should be conducted not only on careful and conservative but on continuous lines. To such a policy Earl Rosebery has publicly committed himself, and it is not to be expected, therefore, that there will be any new departures in Egyptian affairs or anywhere else. One exception, however, the new Secretary may well make to his announced purpose to follow the lines marked out by his predecessor. We refer to the long-standing territorial dispute with Venezuela. When Minister for Foreign Affairs in the foregoing Liberal Cabinet, he had made a definite agreement to submit the controversy to arbitration; but when Lord Salisbury came in, he repudiated the agreement, on account, we believe, of some fancied personal slight. It would be fortunate if the negotiation could now be put back where it was before and a peaceful settlement of a troublesome question arrived at. Earl Rosebery has been said by an admiring fellow-Scotchman "not to be stupid enough to be a great man." It remains to be seen if his alertness and humor will not save him from blunders into which a more ponderous man might fall.

An important question in regard to an author's rights is involved in a case recently passed upon in the English courts. In 1886, Mr. Sidney Lee, the well-known editor of the 'Dictionary of National Biography,' sold the copyright of his Life of Lord Herbert of Cherbury to a London publisher, who issued it in that year. Since then the copyright has been sold to another publisher, who brought out the work this year in a mutilated form—the entire preface and several passages being omitted. Action was brought to restrain him from putting the volume on the market in that form. The author contended that the publication in the abridged form, without any intimation that it was an abridgment, was damaging to his reputation, as was also the placing of the date 1892 on a work written six years earlier, inasmuch as it gave him the appearance of having neglected material brought to light in the interval. The Justice held that he could not pass upon the moral question involved, though he pretty plainly intimated his opinion that the publisher had violated the proprieties, but decided that "there is no law compelling a man to publish the whole of the work because he has the copyright on the whole." But the question of injury to an author's reputation was distinct, he held, and for such injury the remedy is an action for libel. Mr. Lee, however, declined to pursue the matter further, as he had already accomplished his main object, which was to show publicly that he washed his hands of the book in its new form, and so the case was dropped. It was made clear, nevertheless, by the language of the Court and by the testimony of distinguished publishers called for the plaintiff, that an action for libel could have been maintained successfully; and thus the case will, after all, serve as a warning to publishers against too free cutting and hacking of an author's work.

The subject of State insurance has naturally been prominent in the discussions of the Economic Science section of the British Association, the President, Sir Charles Freemantle, examining the operation of the German law, and considering the arguments advanced in England in support of a similar scheme. His conclusion is highly unfavorable to any plan of the kind. The law is extremely odious in Germany, and a movement to effect its repeal is said to have started in Bavaria. Moreover, the mutual-aid societies have ceased to exist, or have been greatly crippled, while dishonesty has been fostered by the requirements of the act. As to France, the bill brought forward by the Government last year appears to have succumbed to the destructive criticism of the economists, for nothing more has been heard of it. As to the English schemes, the President condemns that of Mr. Charles Booth for the enormous cost of administration which it would involve and for the openings it would offer to fraud; and like objections apply to modifications of this scheme. On the other hand, Sir Charles Freemantle was inclined to give up the idea of Government help and intervention altogether, and he cited instances where the abolition or reduction to a minimum of out-door relief had produced the best results. If the methods adopted in these cases were universal, it is probable that the number of paupers over sixty years of age could be reduced one-half.

One of the many advantages of protection over free trade is well known to be the ease with which, after having triumphantly shut foreigners out of your market, you can let them in by means of commercial treaties. Free-trade countries have no concessions to offer, and so can hope to secure none, and are thus left in the wretched condition of getting all their imports free and cheap without the consolation of a single treaty to raise the price of some of them. Recent diplomatic negotiations of France with Switzerland and Spain would indicate, however, that even the course of protection does not run so smooth as we have been assured that it would in the matter of reciprocal trade arrangements. France offered Switzerland her minimum tariff in return for most-favored-nation treatment, and the Swiss were quite ready to strike a bargain on that basis, provided only that they could get a little shading from the minimum tariff on certain articles—embroideries, silks, clocks and watches, etc. But this was altogether horrifying to the French. Their minimum tariff was a sacred thing, the very rock-foundation of their whole protective system, and not a flake could be chipped off of it. Meanwhile, the Spanish negotiators were making a very similar reply to French demands. Spain had offered minimum tariff for minimum tariff, but no, said the French, your minimum tariff is quite outrageous in several particulars, and we shall have to have reductions on as many as sixty-five articles before we can consider the exchange a fair one. To this Spain would not listen, asserting that her minimum was absolutely minissimum, and there the negotiations hang, leaving these two high-protection countries in almost as helpless and ridiculous a plight as unhappy and treatyless England.

RIOT AND PROTECTION.

THE extraordinary spectacle presented to the American people during the past week of four States of the Union with their militia in whole or in part simultaneously in the field to suppress riots and prevent bloodshed, ought to win the attention of thoughtful citizens to some of the deeper causes of the phenomenon. No form of government nor fiscal policy in modern civilization can boast of freedom from labor troubles passing into violence. The spirit of trades unionism is essentially monopolistic and prescriptive, and has often shown itself as lawless, if not as audacious, as in the recent outbreaks. Yet it remains a fair subject of inquiry whether this intolerant temper of labor organizations, and their determination to break down and destroy all competition, have not been aggravated, if not justified, in this country by the dominant course of our national legislation.

Everybody has been interested in the details and development of these gigantic strikes, but only a few have given a second thought to contemporaneous occurrences which are really as significant as the strikes and help to explain them. Last week, for example, an invoice of rugs and carpets was refused a landing in this city by our customs officials, and had to be shipped out of the country. It appeared that they were the manufacture of convict labor in Austria. We have a law which forbids the importation of convict-made goods. This is a law we glory in, as showing our tender care for our own workingmen: we will not subject them to competition with convicts. Out in Tennessee, the miners say they will not be subject to such competition either, and proceed to shoot any one who says they shall. Why should we condemn in them the thing which we commend in ourselves? If they are executing our own teaching, and bettering the instruction in the way rude men have of making laws with rifles instead of lobbying a bill through Congress, what occasion have we to be so greatly astonished?

Probably not a week has passed since the McKinley laws went into effect that attempts have not been made, and usually with success, to get imported goods put into the highest possible classification so as to lay as heavy a tax upon them as possible. But a few days ago, for example, there was great rejoicing over the failure of a certain firm to get through a large invoice of unfinished dress goods at a low rate. This was a victory for home manufacturers and working people. The tariff is designed to keep our laboring classes from competition with those of other countries. The work of this country is theirs, and no one else shall have a share in it if we can make laws stringent enough to prevent it. If that policy, long avowed and now wrought into our legislation, is not a direct endorsement of the monopoly-loving and competition-hating spirit of trades unions, we should like to be told why not. The Homestead workingmen agree with the Tennessee and Idaho miners and the Buffalo switchmen in carrying out the doctrine of protection to its logical results—only, as they are not fortunate enough to control the law-making power, they have to break heads and wreck cars and burn stockades instead of passing tariff bills.

This cannot be dismissed as mere surmise. The workingmen themselves hold language which shows whence they get their inspiration. The Homestead men flatly say that if protection is for their benefit, they mean to have it, peaceably or forcibly. John Jarrett calls for a law forbidding one employer to pay lower wages than another in the same business, all in the interest of the protective principle. Grand Master Switchman Sweeney has the jargon to perfection. He stands for the elevation and protection of labor. His men are Americans, accustomed to the American scale of wages and living, while the wretched beings whom the companies would put in their places are debased and pauper foreigners, whose competition is ruinous and cannot be endured. So it is all through. The laboring men of this country have been so long assured that they have rights and privileges with which no others can be allowed to interfere, that it would be a special wonder if they had not laid the lesson to heart and begun to make all sorts of logical applications of it. Protection is not responsible for trades unionism; but it is responsible, if any reliance can be placed upon human testimony and reasoning, for the lengths to which trades unionism has gone in this country—for its vehement assertion of the right and justice of monopoly, for its treatment of a competitor as a public enemy, and particularly for the arguments with which it seeks to sustain its course.

The home market for manufacturers has been so long and earnestly preached that it is not strange to find workingmen crying up the need of a home market for labor. A striking letter from a correspondent who declared himself "a workingman, a protectionist, and a Republican," appeared in the *Tribune* of August 8. In it the following pointed queries were put:

> "Does not competition control the price of all products, natural and artificial? If competition does so control products, does not competition also control the price of labor? If competition controls the price of labor, what protection has the workman of to-day under the law known as the McKinley Law, outside the increased demand for labor by the introduction of the new industry known as the manufacturing of terne and tin plates? Is it not a fact that the workmen's share of protection is decided by the competition among them for places to work, the same as the quantity of manufactured or natural products of a like kind is decided by the number of purchasers for a given quantity for sale? Is the law excluding the Chinese from the country constitutional? Presuming it is, would not laws prohibiting other nationalities also be? Would not a tariff placed on immigration be a direct protection to the workmen, and, in fact, their only protection, except that voluntarily given by the employers of labor?"

The writer added his conviction that "our platform would be many thousand votes stronger did it advocate a tariff on foreign emigration." The editor endeavored to soothe this troubled inquirer, and to prove to him that such a tariff "has not yet been found necessary," by asserting that wages have risen in spite of unlimited immigration; but we fear the logical mind will not be put off in that way. If wages have risen with immigration, how much higher they would have gone without it. Besides, if the principle is admitted, as it virtually is by the *Tribune* in its "not yet," why not apply it and make the tariff really "symmetrical"?

Political principles have an ugly way of extending themselves, however carefully their inventors may try to restrict their application. If monopoly is good for employers, it will be hard to make workingmen think it is bad for them. If competition is deadly to the former, the latter cannot be wrong in trying to escape from it. In short, if manufacturers have had full swing with protection for thirty years, it ought not to surprise them if workingmen are demanding their turn and insisting upon their understanding of the great doctrine.

LIGHT ON THE LABOR PROBLEM.

To a superficial observer, the events of the last few months in this country might seem to indicate that the "labor problem" was further from solution than ever. But the darkest hour is just before dawn, and, in spite of the violence of the recent outbreaks, there are many reasons for supposing that an era of comparative peace may be at hand. The most important of these reasons is the change in the course of the civil authorities. In previous labor troubles they very generally neglected their duties from political cowardice, and the labor organizations came to count upon such delay in maintaining order as gave them a great advantage in their contests with their employers. But the military force has been so promptly called out and so effectively handled this summer that comparatively little property has been destroyed by rioters, and the knowledge that the whole power of the State will probably hereafter be exerted to prevent the interruption of business will tend strongly to discourage the turbulent. Hitherto, it might almost be said, the attitude of the Government has been such as to put a premium upon violent methods on the part of strikers and their sympathizers, but there is every indication that that day has passed.

This change in the conduct of the executive officers of government is due to a change in public sentiment. There has been no diminution in the amount of sympathy for manual laborers, or in the desire that they should improve their condition in every way possible. But there is far more discrimination exercised upon the subject than formerly. Strikes and boycotts are looked upon with increasing disfavor, as

tending to injure laborers rather than to improve their condition; trade unions are now seen to be organizations of dubious character, attempting to get advantages for their members at the expense of outside laborers, and there is a general recognition of the truth that many of the hardships of laborers are due to their own misconduct. Indeed, one of the more intelligent of the labor leaders is reported as saying that the failure of their movements was due to the number of rascals among the labor organizations. Upon the whole, it may be said that the presumption has ceased to be in favor of laborers in their controversies with their employers; the public now will know what their claims and what their methods are before granting its sympathy.

It would be an interesting research to disinter the newspaper judgments of a few years ago, at the time of the strikes on the horse-car lines in this city, for instance, and compare them with the current newspaper opinion; but the same lesson is taught by a more recent occurrence. At the outbreak of the Homestead troubles, the New York *World* took it for granted that the popular demand would be for fierce denunciation of employers and violent support of "labor," and shaped its course accordingly. But it found that the *Sun*, which had seen the error of its former ways and most vigorously assailed "labor" and defended the employers, was gaining a great advantage over it, and it has within a short time entirely changed its tone. Over the outbreak at Buffalo it roars as gently as any sucking dove. Hardly anything could be more significant of the real state of public opinion than this change of newspaper policy.

The resumption by the civil authorities of their normal function of keeping the peace operates in another way unfavorably to the campaign plans of organized labor. It removes their great grievance, the employment of "Pinkerton's men." It is true that this was a purely sentimental grievance, as it could make no difference to rioters whether they were shot by Pinkerton's men or by the militia; but still it was a grievance. They are now reduced to complaining, in behalf of the taxpayers, of the expense of supporting an army of soldiers; but as they objected to the employment of Pinkerton's men, who were hired by private persons and cost the taxpayers nothing, it is evident that their real ground of complaint is not the character or cost of the force that keeps the peace, but the fact that there is any such force employed. The taxpayers, having in mind the bill that was presented to them in Pennsylvania on account of the work of the mob in 1877, will probably dispense with suggestions from this quarter. However this may be, if our governments, as now seems probable, are going to do their duty hereafter, Pinkerton's men will disappear with the necessity that called them into being, and organized labor will have to win on the merits of its own case, and not through the odium of the defensive measures of the employers.

Since such a change has taken place in the disposition of the executive officers of Government, is it unreasonable to suppose that legislatures may be found to be more amenable to reason than hitherto? There is much talk of the difficulty of "solving the labor problem," but so far as solving the problem of strikes upon railroads is concerned, there is no difficulty about it except what is caused by the Government. The public interest requires that a railroad engineer or fireman or trainman should not abandon his work without reasonable notice. This is not a matter that affects railroad managers and their men alone, and there is no constitutional reason why the State should not regulate it. As it is, a railroad company may make a contract with a man that he shall not leave its service except after due notice, but the State practically refuses to enforce the contract. The company may of course sue the man for damages if he breaks his agreement, but the remedy is worthless. Let the violation of such a contract be made a misdemeanor, and we shall have an end of these outrageous interruptions of the business of the country.

Even without this remedy the law of conspiracy might be invoked, but it is not a suitable remedy for the evil, and its application would be difficult and unpopular. Where employers have dealt directly with trade unions in making their contracts for labor, and these unions have struck in violation of their agreement, it would seem that actions would lie against them, and that, as they have funds, judgments might be collected. One such judgment would be a most valuable lesson to laborers, teaching, what very many of them ignore, that contracts fairly entered into cannot be broken with impunity. But, as has been often urged, the proper remedy for the particular disorder from which the railroads suffer is suggested by their legal status. The State controls them, prescribing what they shall charge and how they shall conduct their business. Being thus creatures of the State and its agents, the State can prescribe the terms upon which employees shall be engaged, and in the exercise of its police power it can make it an offence for any employee to obstruct traffic by unreasonably leaving his work before the term for which he contracted to labor has expired. A short time ago such a law could not have been passed, but it is evident that the public are now ready for it, and the party that has courage to adopt such a measure will find that it has abundant popular support.

THE BALLOT IN MISSISSIPPI.

THE Constitutional Convention which met in Mississippi two years ago devoted the larger share of its time and thought to the consideration of means for eliminating the ignorant negro vote. The method finally adopted received the hearty support of ex-Gov. Alcorn and ex-Chief-Justice Simrall, who represented the white Republicans, and of Isaiah T. Montgomery, an ex-slave, who represented the colored Republicans. The object of intelligent men, white and black, Republicans and Democrats, was clearly stated at the time by ex-Gov. Alcorn, who wrote:

> "The Convention was called with a view of devising some means of putting a check in the text of the Constitution upon ignorance and corruption. The people felt the sting of the North in the continued charge of forcible domination in the South of the ballot-box. The desire to free themselves from this charge, which they felt in some degree to be true, and the wish to devise some means more in accord with civilization and statesmanship to save themselves from the impending ruin, led to the calling of the Convention."

Mr. Montgomery, who was a member of the Committee on Suffrage, concurred in its report, which was adopted by the Convention. Its main feature was the requirement of an educational qualification and of the prepayment of a poll-tax in order to entitle a man to vote. It was expected that this would result in an immense reduction of the negro vote, as the larger part of the race are too ignorant to pass the educational test, and many of those who could pass it do not care enough about voting to pay $2 for the privilege. Mr. Montgomery agreed with ex-Gov. Alcorn and ex-Chief-Justice Simrall that it would be better for all concerned if the members of his race did not vote until they knew enough to read the Constitution, and were interested enough in the suffrage to be ready to pay a poll-tax.

The first registration under the new Constitution has recently been completed, and it shows that the negro vote has been as fully eliminated as was expected and desired by the colored and white Republicans who helped to frame it. The number of whites registered is 68,127, and the number of negroes only 8,615. The colored males of voting age number about 147,000, while there are only about 110,000 whites of the same class. In other words, only one negro in every seventeen is registered, while two whites out of every three are on the list. Although there are many counties in which the negroes greatly outnumber the whites, there is not a single one where the colored vote this year will be more than "scattering."

Some Republican organs in the North are complaining that it is not fair to allow Mississippi her present representation in Congress and in the Electoral College while her number of voters is so small. The Springfield (Mass.) *Union*, for example, says that the 76,742 registered voters of Mississippi are represented in the Presidential election by nine electoral votes, while the 335,747 in Massachusetts are represented by only fifteen electoral votes, so that each elector in the Southern State represents 8,527 voters, while

each in the Northern stands for 22,383 voters. "Thus," it says, "a Mississippi voter has nearly three times as much influence in the election of a President as a Massachusetts voter." The *Union* says further:

"We have no quarrel with the educational qualification in Mississippi. Fairly administered it would be a good thing, and would promote education. But we do object to this relic of the old slaveholder's claim that he should be allowed to represent the slave population in Congress and in the election of President. If the white voters of Mississippi are determined not to accord civil rights to the negroes, the whites should not be allowed to represent the negroes. The North has been cheated in this way about long enough, and it is time that we had a little of the English Liberal principle of 'one man, one vote,' in this country."

Republican organs which talk in this way do not appear to understand the basis upon which representation in Congress, and therefore in the Electoral College, is fixed by the Constitution. Section 2 of Article 14 provides that "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." It is not a question of the possible number of voters, or of the actual number; it is simply a question of the actual number of persons—men, women, and children. There are proportionally a great many more women in Massachusetts than in the newer States of the West, but that does not affect the representation of the State in Congress. If nine out of every ten men in the State to-day were to leave it, and the same number of women came in their places, the State would still have the same number of votes in Congress and in the Electoral College, although not one of those women could cast a ballot for either representative or President.

In asking how many Congressional and electoral votes Massachusetts and Mississippi shall have when a new apportionment is made, as by the last Congress, the question is not how many males each State has who do vote or may vote, but how many men, women, and children (excluding Indians not taxed) it has. It is, indeed, true that the Constitution provides that when the right to vote is denied to any of the male inhabitants of a State over twenty-one years old who are citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, "the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens, twenty-one years of age, in such State." But this provision has no applicability to such regulations as those in Massachusetts and Mississippi, requiring a citizen to pass an educational test and pay a poll tax before voting, any more than to the regulations in this State which prevent a man from casting a ballot unless his name is on the registry list a certain length of time before the election. The State does not deny a man the right to vote when it tells him that he must learn to read, or that he must pay a tax, or that he must go through the process of registration, in order to exercise it, so long as any such regulation applies to all men, as is the case in these respects in Massachusetts, New York, and Mississippi.

Undoubtedly the present situation in Mississippi is abnormal and exceptional. It is also certain to be temporary. The time will come when most of the negroes will learn to read and will care enough for the suffrage to pay a two-dollar tax for the privilege of exercising it. Until that time comes it is the opinion of the wisest Republicans in Mississippi of both races that it is best for the State that the negroes should not vote, and outsiders may well accept their judgment as to the matter.

HARRISONIAN FOREIGN POLICY.

THE break of the Republican party with the college professors of the country on the tariff question is, of course, easily explainable on the theory of their contamination by English literature and British gold. Why they should also differ with the great Republican lights on questions of international law is not so clear. The fact remains, however, that as soon as the professors come to pass upon the acts and attitude of President Harrison's Administration which relate to foreign affairs, they concur in condemning both the decisions arrived at and the legal arguments upon which those decisions are made to rest. Prof. Theodore S. Woolsey, who holds the chair of International Law in Yale University, is the latest to join the unpatriotic ranks. He has an article in the last number of the *Yale Review* entitled "An Inquiry concerning our Foreign Relations," in which he demonstrates, as we are sure he will soon be told by high Republican authority, his unfitness not only for such a professorship in any American institution, but even for the position of international law editor on any great American paper.

His "Inquiry" is a perfectly dispassionate examination of the facts and the law, without a trace of political bias or allusion. He begins by referring to the unusual number of "controversies with foreign Powers which have arisen of late," and says that "the question has presented itself whether one main cause has not led to all of them, and if so, whether this does not indicate a change of foreign policy." He then proceeds to an analysis of the actions and contentions of our Government in the Bering Sea controversy, in the Barrundia affair, and in the various phases of the Chilian dispute. In every instance he cites undisputed facts and the recorded legal arguments of the Administration, and simply asks whether those arguments are in accord with the general principles of international law.

In the controversy over sealing in Bering Sea, he says that "the real question" is whether its regulation can be established by this country "through force as a matter of right." Our famous contention that we "own" the seals, he dismisses by laying down the doctrine that "wild animals unenclosed" "can be owned by nobody." And the pet *bonos mores* of Messrs. Blaine and Phelps he rather contemptuously describes as "a meaningless phrase, upon which no rights of capture can be founded." The whole case he finally sums up in the following bit of lucid and unanswerable reasoning:

"The Bering Sea is part of the high seas, and sealing beyond the three-mile limit in it can be prevented only by an exercise of sovereignty over it. Such right of sovereignty we denied to Russia. Such right we now claim, as derived from Russia. Such right, if Russia possessed it, could only be an incident to the ownership of the coasts, and could not exist and be conveyed independently. There is no evidence of an attempt to convey it in lependently. Its territorial right in a portion of the coast bordering the Bering Sea, does not give this country exclusive jurisdiction over the said sea for a certain purpose, or for any purpose. Our fishery disputes with Canada, the precedents in our own history, maritime law, common sense, all discredit the idea. It is a great and an undue stretch of the jurisdiction of the United States to capture twelve ships and warn off a great many more for engaging in a species of fishery many miles from land."

In his discussion of the Barrundia affair, Prof. Woolsey uses the same method of impartial inquiry as to fact and impersonal application of the recognized practice of international law. His finding is that "both Commander Reiter and Mr. Mizner, judged by the rules and precedents of international law, acted with absolute propriety. And yet their action proved so unacceptable to their Government that the one was recalled and the other removed from his command with a reprimand." As in the Bering Sea case, the Professor notices here "a marked extension of the jurisdiction claimed by the United States. It announces to its naval officers the duty of protecting all political refugees sailing under its merchant flag, even when within the waters of the country to which those refugees belong, by strategy if not by force—the duty of bringing asylum to them, instead of permitting them to seek it. This was destined to bear fruit."

That fruit he finds in the Chilian imbroglio. The seizure of the *Itata* was "improper," because she was engaged in a "purely commercial transaction" and was "in no sense fitting out an armed expedition." And the sensational chase by the *Charleston* he declares to be "absolutely novel" in international practice. "A State at peace has no jurisdiction over the ships of other nationalities on the high seas, except on suspicion of piracy. Such a stretch of jurisdiction on the part of the most powerful State on this continent must necessarily appear an alarming matter to all its neighbors." Turning to the right of asylum demanded by Mr. Egan, under instructions from Washington, for the Balmacedists, Prof. Woolsey shows it to have been "excessive" when the almost

uniform policy of our Government is made the test. And the refusal to accept the findings of the Chilian courts, and the setting up of an *ex-parte* naval tribunal in San Francisco and basing action upon its findings, he characterizes as "a fresh example of the enlarged view of our rights of sovereignty to which we are fast accustoming our people, and in which we are training our navy."

It is this "attempt on the part of the Government to stretch its claim of jurisdiction unduly" that Prof. Woolsey finds to be the constant element and tendency in all the instances he has examined. Asking what this means and will involve, he closes his paper with words which ought always to be printed in parallel columns with Republican platform glorification of the honor won the "flag" by the present Administration, and with every valiant stump speech on the same subject:

> "It means in the first place a departure from the old and safe policy of the fathers. It means courting rather than avoiding foreign entanglements. It means one collision after another, each with its sulphurous war-cloud about it. It means the violation of former precedents, setting up new ones in their stead which may prove awkward, even dangerous. It will encourage aggressions upon weak neighbors. It will make this country hated and distrusted by its natural friends. It will weaken its commercial position on this continent, throwing trade into other channels than our own. . . . And again, what will this new policy, if persisted in, involve? If we assume an advanced position, we must be prepared to maintain it. We shall need a larger army; a navy of the first rank; an increase of taxation to pay for these; a reversal of our military and naval policy to maintain them."

We have not quoted the weighty words of this high authority simply because they confirm throughout the position taken by this paper in each of these controversies. Personal gratification goes for very little beside the sense of a great public service rendered by this honored son of an honored father. He speaks for the educated and sane opinion of the country. He represents that tribunal—the tribunal of history—before which all political intrigues and partisan scheming must ultimately be judged. Politicians may boast that they can carry elections and "make history" in spite of all the professors; but, after all, it is the professors who write history, and, just as in the pages of Adams and McMaster the little-great politicians of the past find their pillory, so will their fellows of to-day in the impartial records yet to be made by other college professors.

ROBERT LOWE, LORD SHERBROOKE.

LONDON, August 10, 1892.

HAD Robert Lowe died twenty-five years ago, his death would have been a political event of the first magnitude; but to-day hardly anybody under forty years of age knows who Lord Sherbrooke was, and the new generation wonder why their seniors feel any interest in the disappearance of an undistinguished peer whose name has long since ceased to be heard in either the literary or the political world. It requires an effort to believe that he was at one time held the equal in oratory and the superior in intellect of Mr. Bright and Mr. Gladstone. There are few instances in our annals of men who have been equally famous and whose fame has been bounded by so short a span out of a long life. No one who knew him ever doubted his abilities. He made a brilliant reputation at Oxford, where he was the contemporary and more than the peer of Roundell Palmer (now Lord Selborne) and Archibald Tait (afterwards Archbishop of Canterbury). When he left the University, where anecdotes of his ready and caustic wit were long current, he tried his fortune at the bar, but with such scant success that he presently emigrated to New South Wales, soon rose to prominence and unpopularity there, returned in ten years with a tolerable fortune, became a leading-article writer on the *Times*, entered Parliament, but was little heard of till Lord Palmerston gave him the place of Vice-President of the Committee of Council on Education, from which he was presently driven by an attack, now admitted to have been unfair, of Lord Robert Cecil (now Lord Salisbury). His fame dates from 1865, when he appeared as the trenchant critic of a measure for extending the Parliamentary franchise in boroughs, introduced by a private member. Next year, however, his powers shone forth in their full lustre. The Liberal Ministry, led in the House of Commons by Mr. Gladstone, had brought in a Franchise Extension Bill which excited the dislike of the more conservative or more timid among their supporters. This dislike might not have gone beyond mutterings but for the vehemence with which Mr. Lowe opposed the measure. He fought against it in a series of speeches which produced a greater impression in the House of Commons, and roused stronger feelings of admiration and hostility in the country, than perhaps any other political addresses have done in the present century. The new luminary rose so suddenly to the zenith and cast so unexpected a light that everybody was dazzled; and though many dissented, few ventured to criticise. The surprising effect of these speeches of 1866 can hardly be understood by any one who does not know how commonplace and practical the general tone of Parliamentary debating is in our time.

Parliament then contained, and even now contains, a great many capable lawyers, capable men of business, capable country gentlemen; many men who can express themselves with clearness, fluency, and good sense. Few, however, are able to produce finished rhetoric; still fewer have a range of thought and knowledge extending much beyond the ordinary education of a gentleman and the ordinary ideas of a politician; and the assembly is usually so intolerant of rhetoric, and so much inclined to treat, as unpractical, facts and arguments drawn from recondite sources, that even those who possess out-of-the-way learning are disposed, and rightly so, to use it very sparingly. In Robert Lowe, however, a remarkable rhetorical and dialectical power was combined with a command of branches of historical, literary, and economic knowledge so unfamiliar to the average member as to have for him all the charm of novelty. The rhetoric was sometimes too elaborate. The political philosophy was not always sound. But the rhetoric was so taking that no one could fail to enjoy it; and the political philosophy was put in so terse, bright, and pointed a form that it made the ordinary country gentleman fancy himself a philosopher while he listened to it or repeated it to his friends at the club. The speeches, which were not so much directed to the particular measure as an indictment of democratic government in general, had the great advantage of expressing what many had felt, but few had ventured to say, and of being delivered from one side of the House and cheered by the other. No position gives a speaker in the House of Commons such a vantage ground, because the phenomenon is comparatively rare, and because nothing so much annoys a party and gratifies its antagonists as when one of its own recalcitrant members attacks it in flank. When one looks back now at the contents of these speeches—there were only five or six of them—and is surprised at their success, this favoring circumstance, and the whole temper of the upper class, which was beginning to acquire those Tory habits of thought which it has since so much developed, need to be remembered. In themselves, as pieces of "civil wisdom," the speeches are not first-rate. No one would dream of comparing them to Burke's, either in originality or in weight. But for the moment they were far more appreciated than Burke's were by the House of his time, which thought of dining while he thought of convincing. Robert Lowe was for some months an intellectual idol. I recollect to have been in those days at a breakfast party given by an eminent politician and nominal supporter of the Liberal Ministry, and to have heard the leader of the *Saturday Review* set, an able writer who was a sort of literary and political oracle of the set, deliver, amid general applause, including that of the host, the opinion that Lowe was an intellectual giant compared to Mr. Gladstone, and that the reputation of the latter had been virtually extinguished. This period of glory, which was enhanced by the fall of Lord Russell and Mr. Gladstone from power in June, 1866, lasted till Mr. Lowe, who was now of course a force to be counted with, obtained office as Chancellor of the Exchequer in the Liberal Ministry which came in in the end of 1868. From that moment his position declined. He lost popularity and influence both with the country and in the House of Commons. His speeches were always able, but they did not seem to tell when delivered from the ministerial bench. His financial proposals, though often ingenious, usually roused opposition. Before he left office in 1874 he had ceased to be a force in politics. He did nothing to retrieve his fame during the six years of opposition that followed, and in 1880 was relegated to the House of Lords, because the new Liberal Government of that year could not make room for him. Very soon thereafter his memory began to fail, and for the last ten years he has been quite forgotten. There is hardly a parallel in our politics.

This sudden and complete obscuration of one whose reputation was genuine, because his intellectual powers were really great, requires some explanation. One cause was a purely physical one. He was excessively short-sighted, so that when he wrote, his nose was apt to rub out the words his pen had traced, and he was therefore shut out from all that knowledge of men and of audiences which is to be obtained by watching their faces. For social purposes he might almost as well have been blind; yet he did not receive that kind of indulgence which is extended to the blind. The other cause was moral. Without being ill-natured, he was a hard-natured man, never appearing to consider the feelings of others. He was not unkindly, and he certainly did not, as was believed of another brilliant contemporary, Lord Westbury, positively enjoy the giving of pain. But he had boundless scorn for the slow and the dull and

the unenlightened, and he never restrained his swift and scorching wit merely for the sake of sparing those who came in his way. Instances are not wanting of men who have maintained great influence in spite of their rough tongues and the enmities which rough tongues provoke. But such men have usually also possessed some of the arts of popularity, and have been able to retain the adherence of their party at large, even when they had alienated many who came into personal contact with them. This was not Lowe's case. He did not conceal his contempt for the multitude, and had not the tact needed for humoring it, any more than for managing the House of Commons. The very force and keenness of his intellect kept him aloof from other people and prevented him from understanding their sentiments. He saw things so clearly that he could not tolerate mental confusion, and was apt to reach conclusions so fast that he missed perceiving some of the things which are gradually borne in upon slower minds. There was also a certain harshness, perhaps a certain narrowness, about his views. Even in those days of rigid economics, he took an exceptionally rigid view of all economic problems, refusing to make allowance for any motives except those of bare self-interest. He professed, and doubtless to some extent felt, a contempt for all appeals to historical or literary sentiment, and relished nothing more than deriding his own classical training as belonging to an effete and absurd view of education. He left his own mark on our elementary school system by establishing the system of payment by results, but nearly every change made in that system since his day has tended to destroy the alterations he made and bring back the older condition of things, though no doubt in an amended form. His ideas of University reform seemed limited to the extension of the plan of competitive examinations for honors and money prizes—a plan which more and more displeases the most enlightened of our University teachers, and is felt to have done more harm than good to Oxford and Cambridge, where it has had the fullest play.

It would not be fair to charge him with the results of his vigorous action against the extension of the suffrage in 1866, for no one could have then predicted that in the following year the Tories, beguiled by Mr. Disraeli, would reverse their former attitude and carry a suffrage bill far wider than that which they had rejected a year before. But the sequel of the successful resistance of 1866 may stand as a warning to those who think that the course of resolute opposition is likely, because it seems courageous, to be the right course for patriotic men. Had the moderate bill of 1866 been suffered to pass, the question would probably have slept for another thirty years, and England would still be ruled in the main by middle-class votes. The consequence of the heated contests of 1866 and 1867 was not only to bring about a larger immediate change, but to create an interest in the question which soon prompted the demand for the extension of household suffrage to the counties, and in 1885 completed the process by which England has become a democracy. Thus to Robert Lowe, as much as to Disraeli and Gladstone, is due the tremendous change which has passed upon this country since 1866, and the compass of which is only now beginning to be realized, while its ultimate effects upon the government of the country no one can predict. Lowe himself never recanted his views, but never repeated his declaration of them, feeling that he had incurred unpopularity enough. He had a bitter personal enemy in Disraeli, who once went out of his way to inflict upon him a personal humiliation, when Lowe had made an indiscreet speech; nor was the latter slow to take every opportunity of making Disraeli the target for his own sarcasm. They were not unequally matched. Intellectually Lowe was for most purposes the stronger man; but Disraeli had a skill in manipulating men and assemblies which gave him a far more enduring success, while his foe is chiefly remembered as one of those whose careers illustrate the old dictum that mere mental power is one of the smallest elements in the highest kinds of success.

O. D.

GLADSTONE'S RETURN TO POWER.

LONDON, August 11, 1892.

THE debate with which the present Parliament opened had no importance until Tuesday afternoon, when Mr. Gladstone spoke and Mr. Balfour answered him, before a House crowded to its utmost capacity. Mr. Gladstone's voice was by no means what it used to be, or what it was even three years ago, when I heard him last; but whether this was the effect of advancing years, or of the cold from which he has been recently suffering and has not yet quite recovered, it was not possible for any one who does not see and hear him daily to judge. But even in a partially disabled condition, it is still a marvellous organ, for although he hardly raised it at all, it penetrated to every corner of the House, and was as audible to me in the gallery as if I were sitting beside him. But in another way I thought the effect of age was distinctly visible. The speech was, as regards matter, entirely worthy of his best days. The work he had to do was very delicate, for he had not only to "arraign," and "view with alarm," as we say, the doings of the Tories during the past seven years, but he had to produce something in the nature of an outline of what he would do himself when he came into office, more particularly touching the Irish question. All this called here and there for an emphasis of voice and manner which in olden times was never wanting, but which on this occasion he seemed to lack physical vigor to supply. The result was, that some of his best points were not driven home as they might have been, and in other days would have been, for his oratory has always abounded in fiery passages.

This defect was made the more apparent by contrast with the ringing tones in which Mr. Balfour, who followed, delivered his speech. His youthful, vigorous air when on his feet must, I thought, have suggested some rather melancholy reflections to the Liberals touching their own chief. For there is no getting away from the fact that, immense as Mr. Gladstone's value now is as a party leader, he has passed the period of those *longs espoirs et vastes pensées*, which are an essential part of the equipment of a statesman who supplies inspiration to a great political party. So that nobody can see or hear him without feeling deeply the cloud which his advanced age throws over the future of the English Liberals. The matter of his speech was admirable. It was as dexterous and eloquent as usual, and was marked by an elevation of tone and breadth of view which furnished its chief superiority over Mr. Balfour's reply. This reply was clever, I might say "smart" and incisive, but it was nearly all *tu quoque* and recrimination. He "cornered" the old man with real undergraduate truculence, by means of plenty of quotations from old speeches and letters. In fact, these quotations constitute the principal part of the Tory and Liberal Unionist ammunition. The importance attached to them is curious. Nearly all the English Liberals are recent converts to Home Rule, and ten years ago shared to the fullest extent the views on the Irish question now held by the Tories. Both sides of the House used to join with alacrity in passing Irish coercion bills, so that quoting old speeches against them is very like reminding a convert to Catholicism of the harsh things he used to say of the Pope in his Protestant days.

What has opened the eyes of the Liberal party, as well as Mr. Gladstone's, is the appearance in the House of Commons, under the extended suffrage, of the real representatives of the bulk of the Irish people, for the first time since the Union, and the demonstration that business cannot be done in a satisfactory way, in the existing state of British politics, as long as these eighty-five Irish members remain lodged as a foreign substance in the very entrails of the British body politic. That this would be one of the results of Home Rule if an Irish representation were retained at Westminster, as all are agreed must be the case, is now the chief Conservative argument against it. But the difficulty already exists. The Irish for the third time last night turned a British Ministry out of office on Irish questions. They turned Mr. Gladstone out in 1885. They turned Lord Salisbury out the same year. They turned him out again last night. So that one can hardly believe one's ears when one hears the cleverest men on the Conservative side predicting this state of things as one of the most-to-be-dreaded results of Home Rule, and therefore the strongest objection to it. On the Liberal side, on the other hand, it is, even in the minds of those who most dislike the Irish and are most indifferent to their wrongs, the strongest possible reason for setting them off by themselves in charge of their own affairs. What occurred last night was in fact a triumph and vindication of this view.

And a most exciting night it was. Only Mr. Gladstone, among the leaders, and Mr. Balfour spoke on Tuesday. The debate was adjourned, after some skirmishing, until Thursday, and it was agreed that the division should be then taken. The Ministry were all along anxious that the debate should be protracted, and the final trial of strength delayed, in spite of the eagerness of their rank and file to get away to the moors. The Liberals, on the other hand, were fully determined not to debate, to be content with Mr. Gladstone's statement, and to move on the enemy's works and compel a surrender at the earliest possible moment. Consequently last night they left all the talking to the Tories and the Liberal Unionists. Mr. Chamberlain opened the fray at four o'clock, before a House crowded to its utmost capacity, and there was a vague but ill-founded expectation that Sir William Harcourt would answer him. Mr. Chamberlain probably never did better in his life, and it was curious to see the delighted expectation with which the Tories, and especially the young "swells," watched his opening strokes, as he distributed little squirts of vitriol all around him, a drop or two on "Tim" Healy, a drop or two on Labouchere, on Harcourt, on Asquith, on Trevelyan, and a regular shower now and then on the Irish. A more perfect master of debate, in its lowest form, however, probably never was seen. All its tricks and devices are ready to his hand. Every interruption was

turned to account in the deftest manner. He had a whole arsenal of foolish or inconsistent remarks that his enemies in bygone days had made, ready in his hat, and, after rubbing a little poison on each arrow, discharged it at his old friends with wonderful effect, amidst the uproarious applause and mirth of the Tories. If hatred and contempt were or could become, in these democratic days, great political forces, Mr. Chamberlain would have a great future. His face—to be just a little personal—greatly increases the effectiveness of his peculiar style of oratory, for one rarely sees a human countenance express these passions more vividly. As he turned now and then on the Irish who were behind him, his look was literally baleful, and, in the days of the "evil eye," would certainly have blasted the whole delegation with some atrocious stroke of "bad luck." He spoke for over an hour, with extraordinary cleverness, but I do not think I exaggerate when I say that there was not in the whole of his remarks one word of hope or conciliation for either the Irish or his old colleagues; not one suggestion, solemn as the occasion was, looking to any amicable or harmonious solution of the Irish problem, or to any future for it but a steady application of brute force to bridle discontent. At the end he tried to infuse a lyric strain into his peroration by making a sort of appeal to the Liberals, for the good of the country, not to turn the Tories out or assume office themselves, but the effect was almost ludicrous. The waters of rhetoric, like other waters, cannot be made to rise higher than their source, and a dry, cynical, and mocking nature cannot produce either pathos or solemnity at will.

These remarks are in a measure true of Mr. Balfour also. There is nothing in which Mr. Gladstone's superiority to them both is better shown than in the breadth of view and elevation of tone he manages to infuse into his speeches. All his argumentation on this Irish question points directly to the conclusion that the present state of it cannot last; that "force is no remedy"; that, even if it were, it is impossible, as has now been proved, to apply it indefinitely, owing to the state of British politics; that, in the modern world, great masses of men must be conciliated and cannot be driven; and that, as Burke said, "Your measures must be healing." I am constantly struck here by the resemblance of some phases of the mental condition of the Conservatives to that of the Northern Conservatives about slavery before the war—that is, they maintain that they could settle the Irish question if the other side would let it alone, as if the unwillingness or inability of the other side to let it alone were not part, and a most important part, of the problem to be solved, and as if the ridicule and insult heaped on the Irish for cherishing national sentiment were likely to kill it in days which have seen the Bulgarians and Serbians, after 400 years of Turkish slavery, rise in twenty years into respectable nationalities.

After Mr. Chamberlain's philippic, the debate fell into the hands of the minor men on both sides, and was for three or four hours addressed to empty benches. Among these minor men was a very considerable man in the world of finance and science—Sir John Lubbock—but, as if to confirm the popular impression about the difficulty of making politicians out of scientists, he inflicted on the House about an hour of the dreariest platitudes I have ever listened to, half read and half spoken, in a singsong and hardly audible voice. The interest of the occasion did not return till about ten, when the House was again crowded, and Sir Henry James, who shares with Mr. Chamberlain the honor of leading the Liberal Unionists, to the delight of the Tories and the surprise of the Liberals, took the floor, evidently in a high state of irritation, and proceeded for one hour to pour on the heads of the Gladstonians, and especially Mr. Asquith, a stream of evidently long-pent-up wrath, in answer to the accusation of political "perfidy" and "apostasy" which has been freely dealt out to him and his associates. Sir Henry James is a very distinguished lawyer, who has been Attorney-General under Gladstone, but he is also a very attractive man of the world and an orator of remarkable polish. He gave friends and foes on this occasion a great treat by a defence of extraordinary fire and effectiveness, containing several pieces of invective of the first order, chiefly directed against Mr. Asquith and Sir William Harcourt. The latter was expected to reply, and when Sir Henry had finished, the shouts for him showed how keenly the House would have relished a set-to between two such renowned gladiators; but nothing could induce Sir William to depart from the Liberal policy of silence, and the disappointment was great.

The calls for a division now became very fierce, but the Tory whips reported that some of their men were still absent, and Mr. Chaplin, the Minister of Agriculture, was put up to fill the hour before midnight. What followed was extremely diverting. The House was crammed and the excitement was rapidly rising. The slightest incident called forth cheers and counter cheers, not hand-clapping or stamping, but the usual "Hear, hear!" roused into a prolonged roar of encouragement or defiance. Mr. Chaplin is a large, pompous Tory squire from Lincolnshire, with an immense sense of his own dignity and importance, as "a responsible minister of the Crown"; and the Liberals, and the Irish especially, rose at him as a lawful victim of their impatience. When he began another exposure of Mr. Gladstone's inconsistency by means of old quotations, there arose a tumult of which no description can give any idea. When he leaned over his notes or opened a book, a terrible wail of despair rent the air. When he wet his lips, the applause was frantic, and every sentence or clause of a sentence which could be twisted into a sign of conclusion brought down the house. The general mirth became finally overpowering, and not the least ludicrous feature of the scene was the solemnity with which a carefully attired row of foreign ministers and secretaries of legation, near whom I was seated, looked down on the riot. Either they did not understand English well enough to catch the humor of the occasion, or fancied they were witnessing the beginning of a revolution.

The fun grew faster and more furious as the hour wore on, Mr. Chaplin making a gallant fight. He could not make himself heard, but he did fill up the time, and at last Mr. Balfour pulled him down by his coat-tails, indicating that his men were all on the ground and the final moment was at hand. "Divide, divide," was shouted louder and louder from the Liberal side. The Speaker put the question, and was met by a mighty "Aye" and a mighty "No," in rapid succession. A division is called for, the tellers are appointed. Both sides file out to their respective lobbies. In a very few minutes, the result is announced—350 to 310—but everybody knew what it would be. Mr. Gladstone was one of the last to vote, and as he passed up the aisle to his place the Liberals all rose, most of them mounting the benches, and, hats in the air, gave him a tremendous and prolonged cheer, which, after welcoming him, took up the teller's announcement, and covered him with a storm of applause, through which he hurried somewhat shrinkingly to his seat, and which did not cease till Mr. Balfour rose to say what the Ministry would do. As he stood there, in the forefront of the crowd, a slight and nervous figure, evidently struggling to be calm, looking every inch a gentleman, with a half-shy, half-modest air, his followers gave him, all were pleased to see, the same kind of uproarious tribute Gladstone had received; and after he had moved an adjournment for a week, "after the very important division which had just taken place," the whole assemblage poured out into the cool night, the victors cheering Gladstone until the crowd outside took it up and roared him on his way home. But every one felt that he had witnessed one of the great historic scenes of English history—Gladstone returned to power for the fourth time, at the age of eighty-two, and an English Ministry driven from office for the third time by the Irish vote, which the Unionists have for seven years been trying to treat as a neglectable quantity.

E. L. G.

LEYDEN AND ITS ARCHIVES.

AUGUST 5, 1892.

FEW cities in Europe are more interesting to the historical student than that in which the founders of New England received their political training. Here, during ten years of peace, in the truce between the little fighting republic and giant Spain, dwelt the Pilgrim Fathers. Here they saw, under their own eyes and in actual working, political principles and institutions which they transplanted to virgin shores and a larger field. Here one finds abundant and overwhelming evidence of the existence, centuries before their arrival, of things which our local writers of American history imagine were "invented" in New England. Here in the municipal archives one finds material for a tolerably full history of the Dutch life of the Plymouth men.

From the gallery in the tall broach-tower of the City Hall in Leyden, we took a bird's-eye view of the history of the municipality. A fair day and bright sunlight enabled us to discern the mighty minsters of the towns far and near, and to note the lines of greenery and water that make up the natural map beyond the masses of red tiles. Below us ran the Broad Street, originally the old Roman road to the sea. In front was the Rapenburg, its semicircular canal enclosing the space between it and the Rhine. This formed the ancient city which first received its name of Leythen in 960 A. D. Close at hand is the Burg or round castle of brick-work dating from Saxon, possibly from Roman times. It stands on the hill at the junction of the old and the new Rhine. In front the site of the castle of the Counts of Holland is visible, though now occupied by other edifices. High over all rises Saint Peter's Kerk, under the shadow of which was the Pilgrim settlement of twenty-two houses. This church, begun in 1121 and finished in 1315, was venerable-looking when the Pilgrims first saw it in 1610, and the crossed keys of the holy apostle still form the "arms" of the city. The two canals first cut for the washing of the wool preparatory to the making of the cloth for which the city has always been famous, have been multiplied, while the Rhine River, feeder of them all, has been trained and curbed so as to make many more avenues of water than there are bars to a gridiron. The wide enclosing moat no longer reflects the crenellated walls and lofty fortified gates. These

were demolished a few years ago, but the great canal, with no fewer than fourteen indentations, shows where bastions formerly stood. Of St. Pancras Church, the University buildings, the old home of the Elzevirs, we have not space to tell.

Descending through the spider-like network of wires into the room where the rosy-cheeked player of the carillon is, with fists well sheathed in buckskin gloves, pounding the oaken keys of the music-board, we are soon below the merry bells which are just sounding "Auf Wiedersehen." The main part of the edifice was built several centuries before it received its present sculptured and heraldic front, which was entirely new when the Pilgrims first passed beneath it to declare intentions of marriage, or to consult land deeds and titles previous to purchasing property. Here are the large and numerous rooms devoted to the archives of Leyden, which are the richest of any city in Netherland, and possibly of any single city in Europe.

For the student of political and social science, these records are invaluable because so voluminous and so chronologically continuous. In the matter of the preservation of archives, Franklin's dictum holds good that "three moves are as bad as a fire." Amsterdam, for example, has suffered lamentably from both conflagrations and removals. Leyden, while undergoing siege, famine, gunpowder, explosion, and the ebb and flow of commercial fortune, has never moved her town hall or suffered loss by the flames. The various departments of municipal life, in monastic, feudal, imperial, republican, and monarchical eras, are here fully illustrated for the student. Already, though tons of papers have not been inspected, most of the matter has been arranged and classified by the accomplished Archivarius, Mr. C. M. Dozy. Of mediæval parchment landleases duly sealed there are about 5,000. In many instances one can trace back the titles of land to the original grantee in the thirteenth century. One casually admires the excellent quality of the hand-made Dutch paper and rich black ink, legible after four or five centuries. The story of the land purchases, transfers, and sales of the Pilgrim Fathers is here open and legible, as well as the diagrams and entries made by their Dutch predecessors in business centuries before. In a word, here are practically the registries which the Plymouth men are traditionally believed to have invented and given to the United States.

As to the existence in Leyden of public schools for the common folk nearly 300 years before Robinson's company set foot in the city, the record is no less clear. Entirely separate from church or monastic schools, or private enterprise in pedagogics, we find for the years 1357, 1392, and 1399 records of the appointment by the municipality of teachers and sub-teachers for the city schools. Here are noted the appropriations of public money raised by taxation for the erection of buildings, the maintenance of schools, and the payment of salaries. We read also of protection guaranteed the master against the parents of bad boys whose cuticle may have been welted by too energetic application of birch. These continuous notices of appropriations and various matters of public-school economy occur frequently until the present time. While the children of those able to pay were to bring weekly a small sum to the treasury of the school, poor children were admitted and instructed free. The object of this free education as well as that given at a merely nominal price was "not only wisdom and cleverness, but good manners in church and on the street." In various museums in the country from the Dan of Leuwarden to the Beersheba of Flushing, as well as in the Dutch books, notably one entitled 'A Peep into the Old School World,' I have enjoyed seeing and reading about the text books, rules, apparatus of correction and instruction, and general equipment of these public schools which were common in all Holland in the fifteenth century. Doubtless, also, the Pilgrims' children were trained in those of Leyden in the seventeenth century.

Among other treasures in the Leyden archives are a letter from the Pope in 1290, and an original copy of the Great Privilege of 1477. The records for 500 years and over of the tax-lists, public works, guilds, military and fire organizations, orphan asylums, alms-houses, homes for widows, widowers, and old men, aged couples, and that wonderful system of benevolence for which the Hollanders were and are still famous, are here for the examination of the student. They show that the Dutch were the teachers of Europe in systematic charity.

Those who would make researches into the history of federal government cannot afford to neglect Leyden. For, in addition to the magnificent and voluminous printed publications of the Resolutions of the States of Holland, there are rooms devoted to storage of the original papers illustrating the relation of the sovereign city of Leyden and of the state of South Holland to the central Government controlled by the States-General and the Stadholders. Somehow, to look at even a few of these documents made us remember that Mr. Freeman—possibly for reasons connected with the achievements of Grant, Sherman, Sheridan, and Thomas—failed to complete his History of Federal Government. We recalled, also, that Mr. Bancroft found that his personal knowledge of most European languages except that which most fully enshrines the actual history of a federal republic, did not avail for his treatise on the 'History of the Formation of the American Constitution.' He needed the Dutch and was obliged to have his work in Holland done by deputy. The historian who is yet to give us a worthy treatise on Federal Government cannot afford to neglect the country which gave us, as the framers of our Constitution expressly state, and repeatedly show in their writings, their "great example." To go from Leyden to dine at the house of the great-granddaughter of the Amsterdam banker who negotiated the loans, aggregating $14,000,000, to our country in 1780; to talk with the biographer of Van der Capellen, who, more than any one or many, secured the recognition of John Adams and of the independence of the United States; and to visit the great-grandson of Prof. Luzac of Leyden, the correspondent of Washington, Adams, and Jefferson, and the hearty advocate of American liberty—was but to emphasize to my mind the importance of Holland as the theatre of federal government.

From the record rooms where was the precious documentary history of the Pilgrims, showing not only their petitions, intentions of marriage, tax-lists, and business transactions, but also the proofs of their citizenship and political training in municipal and republican government, it was but a short walk to their old home. We shall not describe what is already familiar. In Clock Alley, alongside St. Peter's Church, one easily finds now the superb bronze tablet set in the outer wall, and unveiled last July with appropriate ceremonies, including a bilingual speech from the lamented Kuenen. Suffice it to say that this tablet is a memorial to the noble, self-effacing teacher, John Robinson, and the appropriate work of a single religious denominational body. It is not, nor was it intended to be, the tribute of the whole American people to the founders of New England. *That*, we trust, is yet to come. The city authorities of Rotterdam on July 11, 1892, at their own prompting, named the street in front of the spot at "Delfts Haven" whence the *Speedwell* sailed for America, *Pelegrim's Kade* (Pilgrim's Quay); and there, it is proposed, the memorial of the American people to the Pilgrim fathers and mothers shall rise. Delftshaven is now a component part of the great city of Rotterdam.

Since 1683, nearly thirty years after the last traces of the English Separatists had vanished from Leyden, the present edifice or Home for Aged Couples was erected by Jan Pesyn. Opening the gate, which is locked only at night, we step into a courtyard neatly planted with flowers, and lined on three sides with small brick houses in which the aged pensioners live. Just like these, though probably not so substantial, were the twenty-one houses in which Robinson's congregation lived, the pastor having the large house used also for a church. Here, in the flourishing city bustling with trade, and lively with English and Continental students (no fewer than 2,000 from Great Britain matriculating during the seventeenth century), tradesmen and soldiers (135 English families attending the English Presbyterian Church only a few rods away), the Pilgrim company lived in comparative comfort. They were lonely only as they may have chosen, for conscience' sake, to be so. "They stood on their own legs," as the librarian of the University remarked to me during one of several visits to Leyden. In this country, where most of the houses rest on piles and incline at any angle they please, the remark suggested independency of a radical sort. I notice that Baedeker speaks of Robinson as the "leader of the first *Puritan* (!) party banished from England," while in the corridor of the Houses of Parliament it is the *Mayflower* (!) that leaves Delftshaven for America.

To say nothing of the University library, the richest in Holland, there is now accessible to all Americans and others of Huguenot ancestry the Walloon library. It is situated at the head of the Kick Steeg, alongside of St. Peter's Church and close to the old Pilgrim's home. Besides the unique collection of books illustrating the origin, history, sufferings, and migrations of the Huguenots, there is a very full and minute slip-catalogue giving references to all known manuscript sources, such as church and town records of Walloons or Huguenots who have lived in Holland. To Americans interested in genealogical studies, or desirous of exploring their ancestry, this library, so accessible and well arranged, is invaluable.

With the archivist of Leyden, I walked down through the park where now stands the new monument to the heroic Burgomaster Van der Werff who ruled Leyden during the siege. On part of this field, long known as that of the Great Ruin—caused by the explosion of gunpowder in which the house of Elzevir was destroyed, and Luzac, the friend of Washington, Adams, and Jefferson, was killed—the University is now erecting new and spacious edifices. A few rods to the south is the gate and bridge first reached by the rescuing boats of the Water-Beggars, which had sailed over the farms flooded by cutting the dykes at Delftshaven. Close to this historic spot whence from the decks of the fleet were thrown up the herrings, cheeses, and loaves to the

famished citizens on March 24, 1574, rises the new fire-proof building which is to contain Leyden's archives. The appropriation by the city of $26,000 is sufficient for a four-story edifice of brick and iron. In each room the shelves will rise no higher than for comfort, as no ladders will be used. Here, probably before the end of 1892, the rich historical treasures will be stored. Very appropriately the building fronts on Boisot Kade, the quay or street named after the brave ecommander of the Water-Beggars who relieved the starving city after the famous siege. It was past this quay, and through the canal and gate also, that the Pilgrims left the city that had sheltered them for ten years, on their journey to Delftshaven, and thence to America. No more appropriate place could be chosen wherein to enshrine the treasures of the past.

W. E. G.

Correspondence.

RAMSAY'S 'LANCASTER AND YORK.'

To the Editor of The Nation:

Sir: May I be permitted to defend the delegates of the Clarendon Press from your censure for issuing Ramsay's 'Lancaster and York' without an index? No one regrets the omission more than themselves. They urged the necessity of an index upon the author with all the insistency they could command, but were unable to induce him to adopt their views. Sir James Ramsay particularly desired it should be understood he was responsible for the omission.—I am,

Yours faithfully,

Philip Lyttelton Gell.

Oxford, August 11, 1892.

"LITERARIAN."

To the Editor of The Nation:

Sir: A writer in last Saturday's issue of *Notes and Queries*, while taking it for granted that the above-named word is "atrocious," wishes to know whether it is "allowable on any grounds." Permit me to dispose of his assumption and to answer his interrogatory.

Lawless in formation, certainly, is *Tractarian*; and yet it will live in history, to the exclusion of *Tractite*, *Tractuist*, and *Tractator*, all which have been proposed in its stead. And every whit as bad as *Tractarian* is *vegetarian*, which, nevertheless, is ineradicably established.

But regular enough, etymologically, is *literarian*, as I had convinced myself, besides feeling that some such expression was wanted, when I first ventured it in print, which was certainly upwards of thirty-two years ago.

Together with the adjectives *centenary*, *disciplinary*, *necessary*, *sexagenary*, *valetudinary*, *veterinary*, etc., we have the substantives *centenarian*, *disciplinarian*, *necessarian*, *sexagenarian*, *valetudinarian*, *veterinarian*, etc.; and closely analogous to the words in the latter group is *literarian*.

To *literatus* and *literator*, for *literary person*, or a longer phrase of equivalent import, there are obvious objections; *literate* is preoccupied in signification; and *literary*, though parallels to it are numerous, has no more chance of acceptance than *literarist*. *Literarian*, however, if we can excuse its pentasyllabism, seems to recommend itself as supplying a desideratum. Very similarly, *obituary* being given, *obituarian*, as a derivative, would be eligible, and, except for its length, quite as eligible as *obituarist*.

It was some time in the fifties, though I cannot say precisely when, that I originally ventured *literarian*, with me an unborrowed fancy. More recently, or in 1873, I find that I wrote: "This being the case, it is no wonder that the thoroughness of the Hindu *literarians* has now become a poor thing in comparison with that of their predecessors who flourished in the ages of faith."—*Scribner's Monthly*, vol. vi., p. 464.

The querist whom I set out with quoting says, regarding *literarian*, "It is, I believe, pretty common in America." Is this the fact? And who introduced the alleged atrocity?

F. H.

Marlesford, England, July 29, 1892.

Notes.

A portion of Mr. Brander Matthews's recent magazine protests against colonialism in letters will be published by Harper & Brothers, under the title 'Americanisms and Briticisms,' in the pretty series of reprints from their magazines after Curtis, Warner, Higginson, Howells, etc.

Mr. Laurence Hutton gathers, under the title 'From the Books of Laurence Hutton' (Harpers), a few brief essays, published in periodicals, upon book-plates, extra-illustrated books, the portraits of Mary Queen of Scots, portrait inscriptions, poetical dedications, and poetical inscriptions. All of these little papers belong in the catalogue of a book-lover's recreations, and they contain a considerable proportion of that minute but not trivial detail which lies in the province of "the curiosities of literature."

Mr. William Winter adds another small volume of literary travel and criticism to those which have been received with so much favor, but the title, 'Old Shrines and Ivy' (Macmillan), justifies only that half of the book which is in fact concerned with foreign scenes. The sketches are written with the grace and sentiment that characterized so happily 'Gray Days and Gold,' and the shining thread of the author's Shakspearianism runs through them; there are tributes to personal friends and acquaintances whose lives or memories were associated with the localities; there is the always impending shadow of the yew. Only a portion of the pages, however, is thus occupied. The latter part of the book is devoted to some dramatic essays reprinted from Augustin Daly's privately issued stage versions of "As You Like It" and other plays; and, last of all, are a charming tribute to Longfellow, written at the time of his death, a few words on Cooper, and a brief eulogium of John R. G. Hassard.

Robert Louis Stevenson has gathered from various magazines a volume of miscellanies (Scribners) which takes its title, 'Across the Plains,' from the opening paper, the notes of an emigrant journey. It is needless to say that the writer had an unpleasant experience, and that the pages show anything but satisfaction with American ways, mingled with much respect for the Chinese, the Indians, and the negro servants, with whom, doubtless, he had a fellow-feeling as being himself an abused member of society. The rest of the volume, made up of travel abroad or of pieces of sentimental sermonizing, is rendered tolerable only by an occasional felicity in the manner. The book is one of the odds and ends that a popular author is sorely tempted to tag his real work with. Mr. Stevenson has not resisted the temptation at all.

F. Anstey's 'Travelling Companions,' another reprint from *Punch* (Longmans), maintains the level of his laughable 'Voces Populi,' from which it differs mainly in telling a connected "story in scenes." The humor is equally irresistible and original. We might fitly term 'Travelling Companions' a comic Baedeker, or, thinking of Clough, a jocose "Amours de Voyage"; or, again, of Henry James, an English portrait of "Daisy Miller," for the American girl abroad is the heroine, and the treatment of her and her "poppa" will not detract from the popularity of the work on this side of the water. Much cleverness is shown in making Miss Trotter's conversation racy of her native soil, as when, on the top of Monte Generoso, she describes the panorama as "just a real representative mass-meeting of Swiss mountains, with every prominent peak in the country on the platform, and a deputation down below from the leading Italian lakes." But she probably said, "I don't believe we *will* have time for Nuremberg," instead of *shall* (p. 35). Mr. Partridge's numerous illustrations harmonize well with the sprightly dialogues.

A new Life of Carlyle, by Prof. John Nichol, appears in the "English Men of Letters Series" (Harpers) without adding anything of interest, either in biography or criticism, to the mass already at hand. It seems to have been impossible for the author to digest into a clear, popular summary the many volumes which contain the monotonous story of his hero's literary and personal career; and the study which is offered in place of such a condensation is no more than a long-winded and involved essay on a thoroughly exhausted topic. Prof. Nichol takes his cue wholly from Froude, though he makes reservations in places where Carlyle's limitations are marked beyond the possibility of error; but the portrait is practically that drawn by the literary executor.

Mr. Albert H. Smyth has made a genuine contribution to local history in his careful account of 'The Philadelphia Magazines and their Contributors, 1741-1850' (Philadelphia: Robert M. Lindsay) during the period of literary activity in that city. The book has drawn wide attention, mainly as a reminder of the time when Philadelphia held the leading place in the country in what then passed for literature. The interest of the record is perhaps greatest because of the strong light thrown upon the exceeding humbleness of our beginnings. Much of an antiquarian flavor is to be found in its pages, and curious passages are to be met with; but the volume is most useful to the student of forgotten authors whose manes will not always come when summoned from the vasty deep.

Mr. William T. Davis publishes a thin volume of local interest, 'Days Afield in Staten Island,' in which he gives sketches of the nature-aspects of the Island, interwoven with some anecdotes of its men, houses, and past life. The book is agreeably written and is not overloaded with naturalists' notes.

Mr. George E. Hardy, one of our grammar-school principals in this city, has, by commission from the N. Y. State Teachers' Association, drawn up a valuable list of 'Five Hundred Books for the Young' (Scribners). It has two distinguishing features in that (1) its grading has been arranged not by years, which is illusory, but by progress at school, as "History and Biography: Second-Reader Grades, Books in one Syllable. Fourth-Reader Grades. Fifth-Reader Grades," etc.; and (2) books out of print have been eliminated. This

shows the author's intent to be to cater for school circulating libraries rather than to connect the school with the nearest public library. Mr. Hardy's annotations are somewhat naïve and familiar, and now and then, it must be said, ungrammatical. A note on p. 52 confounds an abridgment of Darwin's 'Journal of a Voyage' with the original. Mr. Hardy's preface will stimulate teachers and parents to ward off trash and corruption by actively putting sound reading in the way of the young.

Mr. W. M. Griswold, Cambridge, Mass., has extended his valuable "Descriptive Lists of Novels and Tales" with a volume for such as deal with life in France. These are largely, of course, but not exclusively, by French authors, and are all accessible, as being translations, to English readers. Mr. Griswold's method is well known—to help the reader in his selection by appending to each title the best critical or explanatory review obtainable, with occasional annotations by himself, *e.g.*, under 'Ursula': "The moral of the tale," says the *Critic*, "is good, and one is thankful that Balzac wrote one [Only one? See No. 2024] book that, like Zola's 'Rêve' [No. 784], can be put into the hands of a girl." This discrimination *pueris virginibusque* is not, as a rule, attempted by Mr. Griswold in the present volume.

M. Albert Soubies, to whom we owe the admirable series of the *Almanach des Spectacles*, now in its eighteenth year, has just written, in collaboration with M. Charles Malherbe, a sketch of comic opera in France, of which the first volume has recently been published—'Histoire de l'Opéra-Comique, 1840-1860' (Paris: Flammarion; New York: F. W. Christern). The authors outline briefly the origin and development of comic opera prior to its establishment in the Salle Favart, destroyed by fire five years ago. They give abundant dates, and supply a complete list of managers and of theatres. Thus, for the period from 1840 to 1860, they give a detailed history, year by year, with a full account of every novelty, so that one can see the growth of the tendency which threatens to change the light and laughing *opéra-comique* of the "Fra Diavolo" and "Crown Diamonds" type into the more serious and dramatic opera of the "Mignon" and "Carmen" type. This tendency has been accentuated of late years, as will be shown in the second volume of MM. Soubies and Malherbe's book. Oddly enough, a second tendency, to which they do not allude, will probably prevent the first from being harmful. This is the tendency of *opéra-bouffe* to become *opéra-comique:* Offenbach's "La Périchole," Lecocq's "Le Petit Duc," and Audran's "La Cigale," all approach the pure type of Auber and Adam. For the rest, this book is well made and is welcome. The history of a single theatre is like the history of a town or a county—an humble task, perhaps, but eminently useful.

In the *Revue Bleue* of July 16, M. Louis Miramon furnishes new evidence, if any were still needed, of the way in which France, who perhaps leads the world in most of the great arts, lags behind the world in the art of music. M. Miramon writes of Robert Schumann, whose music, he says, is just now coming into fashion in Paris. With the air of the scribe who brings new things out of his treasury, he relates some of the best-known facts of Schumann's life, especially the story of his engagement to Clara Wieck, and of the unsmooth course of their true love, and he quotes the familiar letters. Schumann's letters were published, he says, in 1886. Some of them, we should think, must have seen the light before that date, or, at the least, have been handed about in manuscript. At any rate, almost everything that M. Miramon brings forward now was known and talked about here twenty-five or thirty years ago by people who cared for music. In the same number of the *Revue*, M. Ernest Lavisse continues his valuable study of Frederick the Great, and M. Jean Ajalbert has some most interesting notes—unhappily too little philological—on the patois of Auvergne.

An interesting description of Rotti, one of the Dutch East Indian Islands, by Prof. A. Wichmann, is contained in the fifth number of *Petermann's Mitteilungen*. This island is about 50 miles long, and contains some 60,000 inhabitants, of whom about 4,000 are Christians. As a race they show some notable differences both from the Malays and the woolly-haired islanders. Their language, also, with from six to nine distinct dialects, differs from that of the neighboring islands, but has not yet been scientifically investigated. They raise cattle and cultivate the ground, which is owned by each community as a whole, while the trees are the property of individuals. There is no market, nor does money pass current among them, horses and buffaloes representing large sums and pinang nuts small ones. They choose their own rajahs, the dignity not being hereditary, but these must be acceptable to the resident magistrate. Their religion appears to consist simply of ancestral worship, in which the only known rites are dancing at certain times in a place supposed to be the abode of the spirits, and making offerings of food and ornaments. On receiving these the priests address the spirits, thanking them for the blessings of the past season, and imploring new blessings for that which is to come. Village schools in nearly all the communities are supported at the public expense. Rotti is further remarkable from the fact that it is the only place in the Timor Residency in which slavery is not suffered to exist.

In the sixth number of the *Mitteilungen* Emin Pasha's last expedition is described in some detail by his companion, Dr. F. Stuhlmann. It appears that he reached the great forest through which Stanley marched to his rescue, but, finding neither path nor food, was compelled to turn back. For eight days his people had nothing to eat but leaves and unripe corn. Near the Albert Nyanza, they were joined by some of Emin's former followers who had been left behind on his departure. Their report of the condition of affairs in the Province has a remarkable similarity to that of Stanley. A new mutiny had broken out among the soldiers, because their chief officer secretly invited the Mahdists into the country; in the course of this, many Egyptians were killed. None of the officers, of whom there are still a large number, seemed inclined to leave Equatoria, their ostensible reason being the fear of losing their present rank on reaching Egypt. Nor does it appear that they showed the slightest desire for Emin's return to his former post. The fertile country along the Nile has been reduced to an uninhabited waste by frequent raids and the cruel exactions of the Egyptian soldiers, who, according to Dr. Stuhlmann, are as grievous a scourge to the country as the Mahdists themselves. The return march to the German territory was made under great difficulties on account of hunger, exhaustion, and the smallpox among the people of the expedition, as well as the necessity for occasionally fighting their way through hostile tribes. The scientific results of the expedition, for which no motive or end is suggested in this report, were apparently very few.

In their report to the President and Fellows of Yale University for the year 1891-92, the Board of Managers of the Observatory place on record their high estimate of the generosity and personal worth of their colleague, Mr. E. M. Reed, who died in February last, and who had aided the institution by repeated gifts. The chief astronomical activity of the Observatory has centred in Dr. Elkin and Mr. Chase, who have been collecting the observational data requisite for a new determination of the mass of Jupiter, from a long series of intermutual positions of the satellites of that planet. Dr. Elkin still prosecutes his work on the parallaxes of the ten first-magnitude stars of the northern hemisphere, and he estimates that two years more will enable him to conclude this research. Next he will undertake a reconnaissance of all the rapid-moving stars which the heliometer will show, with a view to singling out those which are near enough to the earth to have a measurable distance. There are more than a hundred stars in the northern hemisphere with proper motions exceeding a half-second annually, whose parallaxes have not yet been adequately examined; and the investigation Dr. Elkin is proposing to himself will in any event be well worth the two or three years needed to complete it.

The oldest of the Scotch universities has not only determined, as has already been mentioned in these columns, henceforward to admit women "to any class or classes they may select, with a view to graduation in arts, science, theology, or medicine," but has also taken what, if we may judge by the action of some of our own universities, is the still more heroically generous step of offering to its women students a share in its pecuniary benefits. In the year 1893 a sum of upwards of £30,000 will become available for bursaries or scholarships at the University, "one-half of which is reserved for women students *exclusively.*" St. Andrews, moreover, emphasizes its attitude toward the medical education of women by the further statement that "those who intend to enter the medical profession will have a prior claim to these bursaries, although they are tenable while arts and science classes are being attended." Scottish women students will therefore have to thank their Alma Mater not merely for the crumbs which fall from her amply spread table, but for an honest and substantial half of the loaf.

—Educators will find much to interest them in 'Studies in Secondary Education' (Macmillan), consisting of an introduction by Prof. James Bryce, and twelve chapters or essays contributed by six writers, all or nearly all of whom are connected with the "National Association for the Promotion of Technical and Secondary Education." The separate chapters are, in great part, of a practical character, and full of useful details concerning secondary education, by which is meant all of education between the primary school on the one hand and the university on the other. By reason of differences of social organization, the problem of education in England involves considerations which have little if any weight among us; nevertheless, there are many things in this book which may be at least suggestive to Americans. Perhaps not the least suggestive is the great change wrought, within the short space of twenty-five years, in the public sentiment of the English people as to the proper attitude of the State in matters of education; a change which must, in the main, be

attributed to the elaborate and valuable report, accompanied by appendices filling twenty-one volumes, presented in 1868 by the Schools' Inquiry Commission and representing the results of three years of exhaustive labor. The Commission was a strong one, and was reinforced by a number of assistant commissioners, among whom were such men as Mr. Bryce, Matthew Arnold, and Prof. T. H. Green. A summary of the report forms one of the chapters of the work before us, but more than one-half of the book consists of detailed descriptions of the present condition of secondary education in a number of special, selected districts. It must be admitted that, although great improvements have been made, there is plenty of room for more. The editors of the book are convinced that it is useless to expect a good system of secondary education to be self-supporting, and that further legislation is required so that local governing bodies may be authorized to levy taxes for school purposes and to exercise control over the system of education. An act for the registration of teachers is also called for. What seems the most startling departure from traditional English policy is the demand that even private schools shall be subjected to some measure of public inspection.

—The tenth edition of Quain's 'Human Anatomy' (Longmans, Green & Co.) is largely a new work by Profs. E. A. Schäfer and G. D. Thane of University College. During the last two years there have appeared four parts, including Embryology and Histology, by Prof. Schäfer, and the Descriptive Anatomy of the bones, joints, muscles, and circulatory organs, by Prof. Thane. The remaining subjects will occupy the third volume, promised soon. Noteworthy and commendable features are the larger page, the bibliographical lists, and the new and often larger illustrations, the parts designated by their names instead of by numbers. Several embryological figures are from the recent works of His, and American anatomists will be pleased to recognize some from C. S. Minot's articles in the *Journal of Morphology*. A most encouraging evidence of the leavening influence of general biological considerations upon anthropotomy is afforded by the following paragraph:

"The words *anterior* and *posterior*, *superior* and *inferior*, and several others indicating position, are employed in human anatomy strictly with reference to the erect position of the body. But now that the more extended study of comparative anatomy and embryonic development is largely applied to the elucidation of the human structure, it is very desirable that descriptive terms should be sought which may, without ambiguity, indicate position and relation in the organism at once in man and animals. Such terms as *dorsal* and *ventral*, *cephalic* and *caudal*, *central* and *peripheral*, *proximal* and *distal*, etc., are of this kind."

—Prof. Newcomb, writing to the *Astronomische Nachrichten* from Aix-les-Bains, Savoy, a timely paper on the law and the period of the variation of terrestrial latitudes, directs attention to an early research of Euler demonstrating that if a free rigid oblate spheroid be set in rotation around an axis making a small angle with its axis of figure, and be not acted on by any force, the position of the axis of rotation within the spheroid will describe a circular cone around the axis of figure with a uniform motion. So long as the angle between these axes remains small, the period of one revolution of the axis of rotation is a constant, and determinable very simply as a function of the principal moments of inertia of the spheroid. To apply this principle to the case of the earth, this theoretic period was long since fixed at about 306 days, and the eminent German astronomer, C. A. F. Peters, was the first to discuss the question whether observations were sufficient to reveal the existence of a corresponding variation of terrestrial latitudes. Later, the investigations of Nyrén and others showed that if an inequality of this period existed at all, its amplitude could not exceed a few hundredths of a second—that is, a few feet on the surface of the earth. As, however, the earth is by no means a solid and rigid spheroid, but is partly covered by a fluid envelope and has perhaps the elasticity of steel, to adopt the conclusion of Sir William Thomson, Prof. Newcomb finds the theoretic period not 306, but 441 days. This is to be regarded as in remarkably good agreement with the period of 427 days, determined by Chandler from observation, and affords conclusive and independent evidence of the rigidity of our globe. We may therefore accept, says Prof. Newcomb, the conclusion that the pole of rotation of the earth describes a circle around its pole of figure in a period not differing much from 427 days, and in a direction from west towards east, as a result of dynamical theory.

—Observation alone will determine the exact length of the period and the radius of the circle; also, ultimately, whether the pole has moved uniformly in a circle of constant radius, as required by theory, or whether disturbing causes have so acted as to change this motion. A preliminary comparison of the results of observations at Washington, Pulkowa, Cordova, and Berlin, from 1865 to 1890, gives rise to a strong suspicion of an increase in the radius of this circle during recent years. As the possible viscosity of the earth and the friction of the ocean would make it slowly diminish, we have to look to motions in the matter composing the earth for causes which have produced the increase. Since the very nature of this phenomenon of variable latitude shows the interior of the earth to be rigid, the necessary motions are confined to matter on the earth's surface. Every change in the ocean or the polar ice-caps shifts the pole of figure of the earth; and the changes constantly occurring are of such magnitude that this pole may shift in an irregular way through a range of one or more decimetres. Evidently, then, the accumulated effect of these small motions, continued year after year, will tend to bring the poles of rotation and mean figure together, or to separate them, according to the way they chance to act. But here the poets have preceded the scientists, Emily Dickinson long ago exclaiming with no little agitation:

> "What if the poles should frisk about
> And stand upon their heads!"

Possibly the poles will never indulge in such license, but it is apparent that they have already been frisky enough to make the astronomers a lot of trouble.

—There has been of late years a very marked revival of the name and fame of Stendhal in France. Thirty years ago both seemed to be resting safely in an oblivion that was likely to be undisturbed. But Beyle was more truly prophetical than most of those who prophesy, when he wrote in 1832, "J'aurai quelque succès vers 1860 ou 1880." Balzac had known his books and admired them, but it was not till the decade of 1860-'70 that Stendhal was truly rediscovered by Taine and others. Since then he has been not without influence upon literature. It may perhaps be maintained that the modern school of literary "psychologues," of whom Paul Bourget is the type, derive immediately from him. Research has brought to light many of his unpublished writings which are now printed. M. Casimir Stryienski, for instance, discovered and published the curious manuscript 'Vie de Henri Brulard,' and also the 'Journal.' Since then, indeed within a few months, we have M. Louis Sarges's 'Stendhal Diplomate,' a work drawn from unpublished letters; and, lastly, the 'Lettres Intimes,' of which our Paris correspondent lately gave an account. While Stendhal's literary fame was suffering eclipse, his grave was also forgotten and neglected. This scandal has just been repaired, and on the morning of June 20 a little body of Stendhalians gathered at the newly-restored tomb. It is a monument of extreme simplicity—a plain slab of granite with a square headstone, in which is set a reproduction of David d'Angers's medallion of Stendhal, enlarged by M. Robert David d'Angers. The epitaph is the "paradoxical," or at least enigmatical, one written by himself at Milan in 1820, and beginning, "Arrigo Beyle, Milanese, Scrisse, Amò, Visse." Beyle was a Frenchman, born at Grenoble, but he always loved Italy more than France.

CAMPBELL'S PURITAN IN HOLLAND.

The Puritan in Holland, England, and America. An Introduction to American History. By Douglas Campbell, A.M., LL.B., Member of the American Historical Association. Harper & Bros. 1892. 2 vols., pp. lxxv, 1,097.

THIS is in many ways a remarkable book. Mr. Campbell has undertaken to prove that some of the most distinctive of American institutions are due to the influence of Holland rather than of England, and has established many of his claims. As a part of his argument, the author enters into an elaborate account of the history and civilization of Holland in the fifteenth, sixteenth, and seventeenth centuries, showing the high development of commerce and art, and the prosperity, education, and morality of its people; and he contrasts its state with that of England in the same period—a land which he declares to have been comparatively barbarous, uneducated, and undeveloped. Mr. Campbell's admiration for republican institutions is intense, and his dislike of a monarchy pronounced. His colors are without much shade. What he would extol is light, and what he would disfavor, dark; but his presentation is striking and in the main convincing. The extent to which he has retold the history of Holland, England, and Scotland during the era of the Reformation seems, however, unnecessary, especially as it is to a considerable degree a summary of Motley and Froude. Probably his thesis would be as effectively maintained if his book were reduced to half its present size.

The instrument by which the institutions that had been conserved and developed in Holland were transmitted to America, was the Puritan. By that designation Mr. Campbell does not indicate a peculiar class of Englishmen merely, but the like-minded, earnest, thoughtful men of England, Scotland, and Holland, whose impulse came forth from the Reformation and was primarily religious. These were the men who brought about Dutch independence. They poured into England during Elizabeth's reign, to escape the persecutions and wars of their home land. By 1562, 30,000 refugees from Flanders were domiciled in England. In 1568 over 5,000 were in Lon-

don alone. By 1587 they formed a majority of the population of Norwich. They were numerous in the Cinque Ports, and, Mr. Campbell thinks, were to be found largely also in the country districts of eastern and southern England (i, 488-90). They were industrious, and introduced extensive manufactures before unpractised on English soil; they also popularized the religious conceptions of Puritanism which had been disseminated among the upper classes by the returning Marian exiles, but which were spread among the people chiefly, the author argues, by these Dutch refugees and by the English who served in Holland during the struggle for independence, or who found a field for commerce and a refuge from persecution in the Netherlands. The Dutch represented, Mr. Campbell shows, a more advanced type of religious, political, and commercial development than the English in the sixteenth and seventeenth centuries; and, however averse to lessons drawn from other lands the average Englishman may be, the English Puritans, and especially the more active wing of the Puritan party which settled America, were quick to see the teaching of the Netherland republic.

Mr. Campbell shows that men instrumental in the planting and moulding of the early institutions of Massachusetts, Rhode Island, Connecticut, and Pennsylvania were brought into intimate contact with Dutch institutions on the soil of Holland. Not only the Plymouth Pilgrims, but Dudley Peters, Hooker, Mason, and Davenport had dwelt in Holland. Roger Williams was familiar enough with Dutch to be the teacher of Milton in that tongue (ii, 203-4); while William Penn was by birth half a Hollander, and preached in his mother's language to the Quaker congregations of the Low Countries (ii, 419). New York was, of course, Dutch in its origin.

If, now, the colonies founded by these men in America show certain institutions unknown to contemporary England, but existent in Holland, their presence, the author argues, must be due to Dutch influence. Mr. Campbell is perhaps most successful in making out a case for the Dutch origin of the American systems of land transfer and mortgage registration (i, 26, 27; ii, 454-464); of popular education (i, 30-35, ii, 340-342); of the written ballot (i, 51-53, ii, 430-440), and of the system of district attorneys and the right of counsel for prisoners (ii, 440-9). But the author by no means limits the influence of Holland to these institutions, and adduces arguments to prove that the township system itself was the product of Dutch example (ii, 427-430). He makes evident a strong probability that the peculiarities of the Connecticut Constitution were derived from the experiences of the founders of that colony in their sojourn in the Netherlands (ii, 421, 426). The Form of Government prepared by Penn for Pennsylvania was in many respects shaped by Dutch precedents (ii, 464), notably in the permanency of the upper house of the Legislature, only a portion of the members being changed at any one election; and in the Legislature's share in the power of appointment (ii, 423-5). From the Dutch institutions thus introduced into these colonies the constitution of the Senate of the United States has derived many of its characteristics.

Mr. Campbell's views of the debt of America to Holland are summed up as follows (ii, 465-6):

"First comes the Federal Constitution, a written instrument as opposed to the unwritten English Constitution. Next are the provisions of this instrument placing checks on the power of the President in declaring war and peace, and in the appointment of judges and all important executive officers. Then comes the whole organization of the Senate—a mutable and yet a permanent body, representing independent bodies politic, and not caste in State and Church. After these features of the national system, but not less important, follow our State constitutions, our freedom of religion, our free press, our wide suffrage, and our written ballot. With these come the free schools, for boys and girls alike, the township system (with its sequence of local self-government in county and State), the independence of the judiciary, the absence of primogeniture, the subjection of land to execution for debt, and the system of recording deeds and mortgages. Added to these are our public prosecutors of crime in every county, the constitutional guarantee that every accused person shall have subpœnas for his witnesses and counsel for his defence, the reforms in our penal and prison system, the emancipation of married women, and the whole organization of our public charitable and reformatory work."

Mr. Campbell is an enthusiast, not to say an extremist; some of his positions are open to question, and can be permanently established, if at all, only by further investigation. But these are comparatively few. In the main he has demonstrated the validity of his claims. His work is of special value in calling attention to factors in the institutional development of America whose importance has been generally overlooked, but which can be no longer ignored.

Not the least interesting portion of the work is the concluding chapter, really of the nature of an appendix, in which Mr. Campbell points out the extent and influence of the Scotch-Irish immigration into the Middle and Southern colonies during the eighteenth century. These "Puritans of the South" (ii, 471) did not originate republican ideas, but they were receptive. They permeated the southern half of the United States, and "it was mainly through their influence that, after the Revolution, republican institutions unknown in England were introduced into the South and West" (ii, 471, 72).

Mr. Campbell's work is evidently the fruit of painstaking labor and bears marks of care and extensive research. Some slips of the pen or of memory may be noted. Vermont was not one of the thirteen original colonies (i, 52). Mr. Campbell has Leyden in mind when he speaks of the University of *Franeker* as "famous as the home of Arminius" (i, 224); and his reference on the same page should be to Stevens's 'History of the Scottish Church at Rotterdam,' not Amsterdam. Bad as were the results of the Thirty Years' War in Germany, it is certainly an extreme statement to say: "When the war ended, everything like civilization was blotted out" (ii, 313). In speaking of the constitutional peculiarities of Connecticut, Mr. Campbell declares that the "system of town representation, in opposition to a representation according to population, prevails in Connecticut alone of all the American States" (ii, 422). It exists to-day in Vermont, where it was copied from Connecticut. The date 1528 (ii, 438) is clearly a misprint for 1628.

The mechanical execution of the work is excellent, and it is admirably equipped with an exhaustive table of contents and index.

THE WORK OF THE WAGE-EARNER.

Methods of Industrial Remuneration. By David F. Schloss. G. P. Putnam's Sons. 1892.

THIS book contains the result of inquiries made in many English factories, workshops, mines, and quarries as to the methods by which workmen are remunerated for their labor. The term "wages" is generic, and in these days of analytical political economy it is essential that the differentiæ of its species should be precisely defined. Nothing is more common than comparisons of wages paid in different countries, made generally for the purpose of founding arguments for or against protective duties. With few exceptions, these comparisons are worthless and misleading, for the simple reason that in them the differentiæ to which we have just referred are ignored. This is plain enough if we reflect that money wages represent only one side of a bargain, the other being some service, generally embodied in a material commodity, rendered to an employer. Any attempt to determine cost of production when only one of these elements is known, is as futile as trying to solve a problem containing two unknown quantities with only one equation.

The end of these inquiries, therefore, is really to ascertain not what wages the employer pays, but what service the employee renders for his wages, or, briefly, what work he does. In this inquiry Mr. Schloss makes a classification of the following kind, which comprehends substantially all the cases. A man is said to get time-wages when he sells to his employer, for a certain sum of money usually, or sometimes for other valuable considerations, the work which he does within a certain time. He gets piece-wages when he sells a certain quantity of work, irrespective of the time it takes him to do it. He gets task-wages when he sells the work which he does within a certain time, with a provision that its quantity shall not be below a certain amount. He gets progressive wages when, being in receipt of wages of any kind, he is further remunerated if his work exceeds a certain standard. These methods of determining the equivalent of wages are practically the only ones in use on any large scale, although several of them may be combined, and several of them may be adopted in the different branches of work in a large establishment.

Disregarding the quality of work (and perhaps in these days it is necessary to add, disregarding sentimental considerations), the interest of the employer, as employer, is to obtain the greatest possible quantity of work for the wages that he pays, or to pay the least possible wages for a certain quantity of work. The workman's interest is to do the least possible work for the highest possible wages, or to get the highest possible wages for a certain amount of work; the alternative statements being in neither case precisely equivalent. The interests of the two parties to the bargain are so far conflicting, but it is the supreme interest of both that the bargain should be struck. The employer *must* make interest on his capital, and at least some profit, or he will be driven out of business. The workman *must* make enough to keep body and soul together, and as a rule to bring up a family, or he will be driven out of existence. Between these limits there lies a debatable ground of considerable width, upon which the conflicts of capital and labor are fought, and which is divided between the opposing parties by their treaties of peace or *modi vivendi*.

This comparison, however, it is important to observe, is defective, for the following reason: It is impossible to treat modern industry statically. It is in a constant flux, and there is no business that can be long carried on without the adoption of improvements. In most departments it would be ruinous to go on without change for more than a few years. The

employer who reduces his cost of production is the one who prospers, and it is immaterial to him, in itself considered, whether this is attained by paying less wages for the same amount of work, or by getting more work for the same wages, or for wages that are not increased in the same proportion as the work; although for many reasons it is practically better to take the latter course if possible. So, too, the laborer is in a progressive state, and is continually able to do more work, in consequence of which he sometimes prefers to spare himself, doing the same amount of work with less exhaustion; but he generally prefers to work up to his abilities for increased pay. Hence what is to be divided between the parties is not a fixed space, but a quantity that can be increased if certain terms of division are adopted.

As to time-wages, they may be satisfactory to the employer in case the work to be done is of a kind in which shirking is impossible or easily detected, because he can then, theoretically at least, pay according to what he gets. But practically in many branches of industry it is not easy to enforce faithful work, and the expense of so doing, where operations are on a large scale, is considerable. Moreover, it is always difficult to reduce the wages of a particular workman on the ground of inefficiency, his dissatisfaction being apt to be so great that his work becomes even less valuable, and it is often, with the present organization, impossible to dismiss him. On the other hand, many workmen for these very reasons prefer time-wages, and they are supported by the modern passion for equality independent of desert. The system of task-wages is odious to workmen as enabling employers to drive them up to their full capacity, workmen being as a rule of the opinion that the rate of wages can be fixed by the employer, and that after he has found out what a man can do, he will insist upon getting that quantity of work for the same wages previously paid for a less quantity.

Still, disregarding quality, the system of piece-wages is, where practicable, most satisfactory to the employer. He knows just what a certain quantity of work will cost him and can shape his course accordingly. It is not so satisfactory to workmen, for the following reasons: The inefficient men are obliged to disclose their inferiority, or are tempted to work beyond their ability. Even the capable are tempted to overwork themselves, and thus shorten their lives or at least their period of vigorous life. And there is also the principle of natural equality, as well as the apprehension that if the pace is quickened, the pay may be after a time reduced. The danger of overwork is real, but of its extent we know, unfortunately, very little. The other objections are outweighed by the advantages of a system that proportions wages to work.

All of these calculations are altered by introducing the consideration of quality. We read in advertisements of houses for sale that they have been built by day's work, it being taken for granted that this makes them more valuable than if built by contract; and this is characteristic of time-work as compared with piece-work. The only object of piece-work is that more work may be done in a given time, and there is necessarily a danger that the work will not be so well done. It is the interest of the workman, and may sometimes be for the interest of the employer, that quantity should be secured at the expense of quality. The system of piece-work, therefore, is limited by the necessity of inspection. Where the quality of work can be easily determined, piece-work tends to establish itself; but where inspection is difficult or costly, it is generally necessary to adhere to time-wages.

We have in a summary way outlined some of the principles involved in this subject, and most of them are recognized in the book before us. The author's observations are in the main well founded, but he is sometimes not free from bias. It cannot be admitted to be true that "an employer who puts his men on piece-wage does so with the express object of forcing the pace"; he may wish only to put a stop to shirking. The failure to present evidence as to the injurious effect upon workmen of working by the piece is a serious defect in the treatise, especially as some evidence is given showing increases of production under the piece-work system ranging from 30 to 100 per cent.

Mr. Schloss is very hostile to the system of "profit-sharing," and his criticisms are deserving of attention. One ground of objection is all to which our space allows us to refer. The workman, if promised a share of profits, may do more work, but the employer may be unfortunate or incompetent, and make no profits, in which case the workman would have been better off on piece-wages, getting his bonus as he earned it. But it is plain that the employer would come to ruin quicker under this system than the other, and his ruin might cause greater loss to his men if thus hastened. The whole case, however, is pretty fairly considered by the author, and his remarks upon the much abused term "coöperation" are noteworthy. This is but a small book for so great a subject, but it is a step in the right direction. We need evidence, however, better authenticated and more precise than most of what is furnished here, and it must be far more extensive before trustworthy deductions can be established. Until this work is done it is idle to discuss the "labor problem." If the labor bureaus in this country were officered by statisticians, and not by politicians, they might supply most valuable materials to economic science, but we cannot expect much from them at present. We may add that Mr. Schloss gained his experience in the employment of a private person, Mr. Charles Booth, whose investigations in London have earned the highest praise.

GREECE OF TO-DAY.

La Grèce d'aujourd'hui. Par Gaston Deschamps. Paris: Armand Colin & Cie.

M. DESCHAMPS, in his 'Greece as it is To-day,' very aptly remarks that "this nation is composed of one small city and a great number of villages; but the city possesses in the Acropolis a priceless treasure, and the villages are inhabited by a clever and enduring race who have undergone centuries of oppression without losing vitality, and who possess the gift of remembering their former greatness with the power of unquenchable hopefulness." It is not the tourist who hurries through this country in an Easter vacation, irritated by the brutality of the custom-house officer, the dishonesty of the innkeeper, and the rapacity of the coachman who has taken advantage of his desire to see as much as possible in a short space of time, who can give a trustworthy account of this interesting people; they do not reveal themselves to the hasty traveller, and he does not begin to know anything about them. Nor does the diplomatist who frequents the gilded drawing-rooms of the rich Athenian bankers, who ape French manners and French luxury, and who, under a would-be gloss of Western culture, have lost all the characteristics and virtues of their race. Yet how frequently have the newspaper letters and magazine articles of such superficial observers estranged European sympathy from the Greeks, especially at moments when the Eastern question threatened to become prominent and Greek pretensions seemed to fan the flame. It is therefore all the more satisfactory to read a book about Greece as fair and impartial as that of M. Gaston Deschamps. We must acknowledge that he saw the country under exceptionally favorable circumstances, as an archæological student of the French School at Athens. This admirable institution, under the scientific direction of the Academy of Inscriptions and Belles-Lettres, gives a three-years' salaried residence in Greece. During the winter the young men spend their time in studying archæology and history; in the spring they excavate or travel in the interior of the country, or visit Constantinople, Smyrna, and the East. Besides being well prepared in archæology and history, our author had the further advantage of a very thorough knowledge of modern Greek, so that the fine shades did not escape him. He is gifted with excellent powers of observation, a fine sense of humor, and a praiseworthy self-restraint in not dwelling on the discomforts he had to endure during his excursions in the remoter provinces.

In modern Athens our author regrets that German architects under Otho have everywhere left their mark, reducing the capital of Greece to a poor copy of Munich. He congratulates the Greeks on having, in the teeth of all the good advice offered them, chosen their position under the Temple of Pallas Athene, for the establishment of their principal city. Ægina and Patras were suggested as being more practical sites for the purpose, but the enthusiasts who regarded the Acropolis as the centre of civilization, carried the day, and the position seems to have inspired even the Emperor of Germany with a degree of lyrical excitement which he gave vent to in telegrams. Gregorovius has recently remarked with great truth that the religion which has never perished from the human soul, but glows in it with continued fervor, is the worship of Athens. M. Deschamps acknowledges that the Acropolis is the one great monument which has not disappointed him, and which far exceeds any previous expectation founded on a photographic acquaintance; and this is owing to the exquisite color of its marble, its surroundings, the lovely atmospheric effects of changing light on the distant hills which form its background. Winter is soon over in this sun-favored land; already in February the days are springlike, and people turn from the feverish atmosphere of politics in the cafés and wander along the Sacred Way towards Eleusis, among scarlet anemones and lavender, or wander on the Acropolis, where asphodel, thyme, and wild sage are already in bloom. And the people are so easily satisfied, they need so little to amuse them. Renan, in his Life of St. Paul, has called attention to this characteristic of the race, its cheerful philosophic tendency, the sobriety of its pleasures, its good humor. Their chief amusement is to walk about for hours on fête days or Sundays; to remain quietly at home would imply mourning or being in trouble of some kind. The poorest workmen—sailors and such like—satisfy themselves with sitting on the turf of Lycabettus and singing their monotonous sing-song, while the better-off club together and buy a lamb, which they roast and

eat in the open air with a glass of resinate wine to wash it down. Our author remarks that they are ready enough to work when they are well paid, but they do not seek work with any persistence, nor do they stick to it long. He cites as an instance how a friend of his was employing some Greek workmen on a job which would have lasted a week. He paid them by the day, and after a few days they very respectfully informed him they were going home, as they had enough to live on for a whole month. The word in modern Greek signifying work is also synonymous with servitude, δουλεία.

The irresistible attraction that diplomatists have for Athenian society is also a sign of the times, for the Greeks pin their faith to the great Powers, always expecting some extension of territory, some help and protection from them in the hour of need. Another reason for their respect for diplomatists is that they are supposed with honeyed words to hide their meanings, and to the descendants of Ulysses this is a priceless charm. The fair Athenian's highest ambition, therefore, is to secure some diplomatic star in the matrimonial market as a means of shining at European courts. The beauty of the Athenian women does not call forth any enthusiasm on the part of our author. He says they have more likeness to Tanagra figurines than to the Venus of Melos. They are generally black-eyed, with thick black hair and long eyelashes, and at twenty they are very fascinating, but soon become faded and too exuberant in form for grace.

The entertainments given in Athens during the winter are chiefly due to the rich merchants who, having made their fortune abroad, in London, Manchester, Marseilles, or Calcutta, return to spend it in their native land. The finest houses are built by them, the hospitals, schools, and public monuments are the result of their munificence, and yet the deputies in the Chamber passed a law reserving for *autochthones* (the indigenous) all public offices and the salaries attaching to them. The professors of the University designated these benefactors as *heterochthones* (of another soil) and the street boys as χρυσοκάνθαροι (golden flies). It was only by a continuance of effusive hospitality that the newcomers healed this feud.

Politics have a great place in the life of the Greeks. A boy begins before he has left college to take part in political discussions, and goes on to the end of his days. There are many different political parties, and people take sides much more on account of their personal interests than for any other reason, for there is neither a religious question nor a social question. For many years the political see-saw has been between Tricoupis and Delyannis. Tricoupis was just out of office at the time of Deschamps's stay in Athens. He describes him very justly as a cold, silent, hard-working man, thoroughly Greek at heart, though English by education, manners, and appearance. He says that all trustworthy judges look upon him as the most remarkable man in Greece; even his enemies cannot but admire his zeal and his capacity for hard work. Deschamps rightly attributes his momentary unpopularity among certain classes to the question of taxation, which, in Greece as in all other civilized States, appeals more than any other to the poorer people. Tricoupis is also reproached with a desire to give a Western character to Greece, while it is a well-recognized trait of this people that, however much they may affect European habits and may desire to mould themselves to Western ideals, they still retain a love of local traditions. Those, even, who have seemingly become thoroughly Parisian by their extreme quickness at learning languages and their adaptability to the habits of those around them, when they return to their old homes present a curious contrast of extreme culture and simplicity of habits, "a mixture of the Boulevard loiterer and the pallikar, a sceptic and a fervent worshipper of the Panaghia" (the Madonna). Tricoupis has the haughty dignity of manner of a European statesman, and although he never for a moment gives up any of the pretensions of the Hellenic race, he likes to proceed in an orderly manner in Government matters, and has no sympathy with bluster and rhodomontade. He is a most distinguished orator, speaking always to the point, with great fervor and coolness, very convincing to his hearers, who cannot but feel that he has whatever matter he treats of well in hand. Yet there are some who pretend that his accent is not purely Attic, and that besides this he is not in touch with Greek character. We are continually told to remember that the Greeks have had only fifty years in which to educate themselves into a civilized nation, and Tricoupis expects them to take a place already among the Powers of Europe.

"In the early years of his Ministry he increased the roads, the railroads, had the seaports properly put in order, built lighthouses on dangerous shores, dressed the soldiers in cloth with shiny buttons. He decreed that the Hellenic navy should no longer manœuvre on land, nor should the cavalry go on foot as in former times. At first the people were delighted at these improvements. The pallikars took the train and climbed on to the promontory of Munychia to watch the evolutions of their light torpedo-boats in the bay of Phalerum; they admired also, on the days of the reviews, the march by of their valiant army, and smiled with contempt as they thought of the rags the Turkish soldiers were dressed in. But alas, their good humor did not last long. When they came to pay for all these fine things, the shepherds of Arcadia were exasperated, they hid their drachmas between their skin and their vests, and made for the mountains. The tax-collectors were received in the villages with abuse and lamentations. The dogs were turned on them, and many of these functionaries were able to feel, notwithstanding their trousers, that Homer was right when he calls the Molossus of Ætolia hard of tooth. This good Greek people, notwithstanding its brilliant qualities, is more democratic, more fond of equality, more imperious than our own; it wants to control, without respite or measure, its own mandatories. It pays its taxes most unwillingly and only when forced to do so. Then when they are paid it remembers neither the arrears nor the debt, nor the functionaries who have to be paid, nor the thousand expenses a budget has to bear. One day my servant, the Cretan Janni, said to me in a tearful voice: 'Oh, sir, under Delyannis we paid fewer taxes, and yet we bought many warships nevertheless.' 'Oh, stranger!' a schoolmaster of Lidoriki in Doris said to me, 'we are heavily laden like donkeys, and we can carry no more.'"

Our author is too just to allow himself to say much about Delyannis, whom he considers the representative of the pallikar feeling. He remarks that the Delyannis party very disingenuously made use of the Cretan question to excite popular feeling against Tricoupis at that moment.

With regard to brigandage, a subject which naturally concerns travellers, M. Deschamps tells us some amusing stories. He says that, thanks to the laws Tricoupis enforced, one can travel with great security all through the country. It is only as an electioneering agent that the brigand is formidable, when he takes across the frontier, and detains for the necessary time the number of voters whose absence from the poll will insure the election of the candidate he favors. After an exploit of this kind he retires to Rumelia to empty his pockets in peace, as he may be certain that the Turkish police will not interfere with him. There seems to be an interesting brigand chief whose exploits have attracted some attention during the last few years, a certain Athanasius, or Capt. Thanasi, as his familiars call him, of picturesque appearance, who with a few pallikars stopped the train between Constantinople and Adrianople, carrying off several of Cook's tourists, besides a banker named Israel. The same Thanasi captured a very important Turk, a nephew of the Sultan, who on his return told wonderful tales of the habits of this mountain king, and who for his ransom had to give the revenue of his lands for a whole year. Among other customs it seems that Thanasi subscribes to three newspapers, one French, one English, and the third Greek; the two former are to keep him abreast of passing events and to inform him of important travellers who may be within reach, while the third is to satisfy his feeling of patriotism, for Thanasi is Greek by birth as well as Greek at heart, has an extreme aversion to Jews, and, although it sometimes happens that he kills one, he never condescends to rob them. This hero will doubtless be immortalized in the klepht songs, if his exploits are as remarkable as the stories we read would seem to show him to be.

The orthodox faith has been for ages an all-powerful factor in preserving Greek nationality in the Turkish provinces. Our author devotes one of the most interesting chapters of his book to demonstrating the attachment of the Greeks to their religion. The politicians who made the treaties supposed that as soon as the limitations of the fatherland had been defined, its children would give up their homes under Mohammedan rule and return to Greece. Such, however, was not the tendency, nor has it been since the fall of the Byzantine Empire. The Greeks have always remained where they were, retaining, notwithstanding, every feature of their nationality, under whatever despotic and hated foreign rule. So it was of old in Naucratis and Bubastis in Egypt; so it is even now in Smyrna, Thasos, Halicarnassus, and Sattalieh. In some remote regions of Asia Minor, Deschamps relates that they have lost all knowledge of the Greek language—in Isbarta, in Caramania, for instance, where the priest repeats the service in Turkish. These people are so ashamed of no longer knowing their own language that they tell a tale of the Turks having cut out the tongues of all the inhabitants so that the children were obliged to learn the language of the conquerors. Capo d'Istria, in giving a definition of Modern Greece to Mr. Willmot-Horton, said: "The Greek nation is composed of men who, since the conquest of Constantinople, have not ceased to practise the orthodox faith, to speak the language of their fathers, and who have remained under the spiritual or temporal jurisdiction of their church in whatever part of Turkey they dwelt." The Prime Minister has therefore, besides governing Greece, to consider the interests of the Greeks dwelling under Turkish rule, who, notwithstanding diplomatic fictions, are under his protection. This makes his position a very difficult one.

The orthodox ritual has remained quite or almost unchanged since it superseded polytheism, and some of the old pagan ceremonies are intermixed. For instance, on the site of an old temple of Apollo (the sun-god) the peasants of Attica go to pray to St. Elias and hang

branches of olive and myrtle, bits of stuff, zinc eyes, and other ex-votos, to obtain cures or to have their prayers answered. The old temples have been turned into Christian chapels, and afford a rich field for the archæologist when he comes on the ruins of such a church. Byzantine icons take the place of pagan idols, and are endowed with the same powers. The church ceremonies appeal to the soul through physical sensations. They are always planned from an effective and picturesque point of view. The gloom of the churches, the lighted tapers and odor of incense, the continual genuflections and signs of the cross the faithful are in the habit of making, impress one more as mechanical and traditional customs than as anything really felt.

Education also takes an all-important place in the organization of Greece. There are thirty-five gymnasia, more than 300 secondary schools, 1,569 primary schools for boys, 332 primary schools for girls. Besides these, in which education is free, there are innumerable independent institutions, among which is the Arsakeion, a college for women, which furnishes school-teachers not only for Greece, but for all the Greek schools in Turkey. This college was endowed by a rich Greek of Epirus, and Greeks from every part of the East send their girls to it. The University also, which is free, is chiefly due to the generosity of the Greeks of Turkey, since their contribution (422,000 drachmas) surpassed that of the Greeks of Hellas, who contributed 308,000 drachmas. This institution is conducted very much on the plan of German universities. It is said that on the day of its inauguration one of the old heroes of the war of independence, being present with all his pistols and yataghans stuck in his belt, turned to his neighbor and remarked: "This place will do more for the salvation of our country than all the sabres of the pallikars." His appreciation was a just one, but there is no doubt that at the present moment, as our author very justly remarks, the liberal professions are overcrowded, and this drives many into the field of politics. It is to be hoped that this difficulty will be solved in time.

"An old legend related by an Icelandic monk who made a pilgrimage to Jerusalem in 1102, tells that in the church of the Parthenon before the image of the Panaghia Atheniotissa there was a miraculous lamp burning whose flame never went out although the oil was never renewed. In the same manner during long centuries, to the great surprise of the barbarians and for the consolation of the conquered nations, the suffering soul of Hellas has endured bright and unquenchable."

The book deserves careful reading. It is amusing throughout, and contains descriptions of the author's journeys in the provinces, excavations in Amorgos, and adventures by the way.

Sir Walter Raleigh: A Biography. By William Stebbing, M.A. Oxford: Clarendon Press; New York: Macmillan.

RALEIGH is the impersonation of the Elizabethan age, the close of which his death marks with singular distinctness, and of which his poem, composed on the eve of his execution, is the dirge. His character is preeminently Elizabethan in its adventurousness, its versatility, its restlessness, its unbounded aspirations, its union of culture with the force of the politician, of the soldier with the sailor, of the practical with the poetical and the romantic; we must add, in the looseness of its morality. For between the moral code of the Catholic Middle Ages and the moral code of Protestantism there was an interregnum marked in the lives of most of the Elizabethan heroes and heroines, and notably in that of "Gloriana" herself. When Raleigh laid his head upon the block, Nature broke a noble and memorable though not a perfect mould. The man's versatility was most marvellous, as were the varying phases of his character and the vicissitudes of his life. "To keep at once independent and in unison the poet, statesman, courtier, schemer, patriot, soldier, sailor, freebooter, discoverer, colonist, castle-builder, historian, philosopher, chemist, prisoner, and visionary," is, Mr. Stebbing says, the biographer's perplexing task. He might have added to the catalogue "member of Parliament" and "ship-builder"; for Raleigh was skilled in ship-building as well as in navigation. In the whole Life there is not a moment of repose or languor. Prison hours are spent in writing history or making chemical experiments. Even disease brings no cessation, and when Raleigh fights for his life against his enemies, he is struggling not for existence but for power to act.

He was so constantly on the stage in all the movements and enterprises of his time, and the interest which he excited caused him to be so often mentioned by his leading contemporaries, that the materials for his Life are pretty copious. Mr. Stebbing seems to have made diligent, skilful, and critical use of them; and unless further search in the Simancas Archives should bring something new to light, his work will probably be accepted as final. Considering that he has always to be picking his way, he has succeeded in giving us an interesting and flowing narrative. One riddle he does not solve: he does not make it clear why Raleigh, till court persecution turned popular feeling in his favor, was so intensely hated. That so restless a schemer should be mistrusted among his own set is intelligible; still more intelligible is it that he should have been excluded from the Privy Council, where he would certainly have tried to dominate, by the jealousy of the Cecils. But the Cecils and the rest of his own set were his rivals. Why should the people hate him? His antagonism to Essex seems hardly a sufficient cause. His services to the nation in the struggle with Spain had been brilliant. His buccaneering tendencies would only enhance his popularity. His orthodoxy was suspected, though apparently without much reason; but belief was then in a general state of confusion, there seems to have been a tendency to free thinking among the higher classes, and the only strong religious feeling among the lower classes was hatred of Rome. Even want of sympathy with the masses, which is imputed to him, would hardly, unless manifested in some way of which we have no record, have raised the mob against him in the streets and made them pelt him as he passed. Something, apparently, is lost to our sight in the mist of time.

With regard to the conduct of the great adventurer in the last tragic episode of his life, there is some difference of opinion between Mr. Gardiner and Mr. Stebbing. Mr. Gardiner takes the severer, Mr. Stebbing the more favorable view. At such a distance of time fine points elude decision. It is vain to think that Raleigh can be made out to have been strictly virtuous or veracious, while on the other hand his lapses from virtue and veracity were not inconsistent with the heroism of those days. Was not Capt. John Smith a hero, and did he not on occasion draw the long bow? Nothing, however, in Raleigh's conduct, taken at the worst, can palliate that of James and his advisers, among whom it is sad to have to number Bacon. The execution of Raleigh upon a State conviction of treason, itself monstrously unjust, when in the meantime he had been commissioned and employed by the Crown as commander of the expedition to Guiana, was of all judicial murders the vilest. Its iniquity was only enhanced by its literal conformity to law. Suppose his commission was under the Privy, not under the Great Seal, and suppose the phrase "trusty and well beloved" was omitted; these subterfuges only betrayed premeditation. To suppose that James and Cecil did not know what they were doing when they sent forth Raleigh into Spanish territories and waters is preposterous. He was sacrificed to the growing inclination of James for a Spanish connection. The signal reaction of sentiment in his favor which followed his murder was a public verdict which posterity has with one voice endorsed, and which no criticism of Raleigh's acts or words in the Guiana expedition or its sequel can affect in the slightest degree. Perhaps the nearest parallel to the murder of Raleigh is the murder of Lally; but even this lacks the element of hypocritical legality which renders the murder of Raleigh so supremely odious a crime.

Schools and Masters of Fence. By Egerton Castle. London: George Bell & Sons; New York: Macmillan. 1892. Pp. 355.

WITH the aid of numerous illustrations, reproduced from volumes which have become inaccessible to the general reader, Mr. Castle has traced the gradual changes in the art of fencing from its remote origin in the sword and buckler play of the middle ages down to the refinements of the present century. An appendix contains a number of plates showing all the known forms of the sword, from the great two-handed weapon of the fourteenth century to the duelling sword of the eighteenth. As new masters arose and invented new methods of attack and defence, the armorers produced improved weapons adapted to the changed order of things, and so this chronological gallery of typical swords becomes a history of swordsmanship.

Paradoxical as it may seem, the development of fencing was largely due to the invention of gunpowder, and that development has reached its perfection in these latter days when fencing is practically valueless except as an exercise. After gunpowder had made armor worse than useless, it became apparent to the fighting men that the heavy sword must give place to the rapier, and that the deadly thrust would soon take the place of the slashing and cutting with which these gentry had amused themselves for centuries. In Shakspere's time the rapier had come into general use, and with it was carried a dagger which was held in the left hand for the purpose of parrying the adversary's thrusts. Hence, in "Romeo and Juliet," we read how *Mercutio*

> . . . "with one hand beats
> Cold death aside, and with the other sends
> It back to Tybalt."

Fechter, Mounet-Sully, and other actors who have appeared in the character of *Hamlet* in recent years, have taken much pride in their performance of the fencing scene, which they carried out in accordance with the rules of modern scientific fencing, but without regard to the fact that in the play *Hamlet* was challenged to a trial of rapier and dagger play. Dumas, Ainsworth, and other novelists have been guilty of similar anachronisms in applying modern terms to combats supposed to have taken place in the seventeenth cen-

tury, when such terms were entirely unknown.

Carranza in Spain and Marozzo in Italy were among the earliest masters of fence in the sixteenth century, while Giganti and Capo Ferro, who wrote voluminous treatises in the early years of the seventeenth century, were the first to explain the advantages of the lunge, and may therefore be regarded as the forerunners of the modern school. It is curious to note how fencing, like so many other avocations, has run in families. The original Angelo came to London about 1750, and he and his descendants taught fencing there for a century. The Cavalcabos taught in Italy and France for a similar period, while the Kreusslers were well-known masters from the first quarter of the seventeenth to the end of the eighteenth century. Mr. Castle stops short of the modern school of fencing, so that his book cannot be regarded as of special importance to the beginner, but it is full of curious information, and, in comparatively small compass, gives a sufficient history of the evolution of swordsmanship.

Specimens of Old French, IX.–XV. Centuries. Edited by Paget Toynbee. Oxford: Clarendon Press; New York: Macmillan. 1892.

We have here an excellent collection of extracts for students of Old French, probably the best, taken all together, of the various *Choix* and *Selections* covering the period in question; for, apart from the Strasburg Oaths and the Cantilena of St. Eulalia, which perforce represent the IXth century, we find sufficiently long specimens of the 'Chanson de Roland,' the Romance of 'Reynard the Fox,' the 'Roman de Brut,' and the 'Roman de Rou' of Wace, the 'Roman de Troie,' Chrestien de Troye's 'Perceval le Gallois,' Jean Bodel's 'Chanson des Saisnes,' and 'Les Douz Amans' of Marie de France for the XIth and XIIth centuries. All the leading names of the next three centuries are found, accompanied, in the great majority of cases, by such selections as evidence Mr. Toynbee's judgment and taste. It is true that the reader will look in vain for more than one favorite piece, especially among the poets of the XVth century, but he has been warned in the prefatory note that, save in rare cases, pieces which have done duty before in other collections have been omitted. This of itself is scarcely a sufficient reason for leaving out passages which possess great literary merit as well as linguistic interest; and while Mr. Toynbee's object is to show the growth of the language in the first place, and, in the second, to give the preference to such specimens as bear upon either the literature or the history of England, we nevertheless hold that a work like this should not exclude an excellent piece simply because it has already appeared.

This reservation made, and the object of the book being borne in mind, there remains nothing but praise for the manner in which Mr. Toynbee has carried out his purpose. He has covered the ground very thoroughly, and there is scarcely a work of any real importance or an author of any note unrepresented in his collection. He has made a judicious choice among the lesser lights, and fairly enough divided his space between the various forms of literature at different epochs. The *chanson de geste*, the *roman*, the *chronique*, the *ballade*, and even the farce and the mystery, are well exemplified, and in this respect the book is valuable to the student of literature. The introduction comprises a brief sketch of the origin of the French language and a *précis* of the characteristics of the Norman and Anglo-Norman, the Picard, and the Burgundian dialects, all of which are, further on, illustrated in the body of the work. A summary compendium of the grammar of Old French completes this part and speaks well for Mr. Toynbee's ability to compress essentials within a small compass. The notes are very full, scholarly, and to the point; they fill one hundred and ten closely printed pages, and, while exhibiting thorough knowledge, are not overloaded with mere erudition for erudition's sake. A glossary of two hundred and five pages, in two columns, completes the work, and makes the study of the numerous specimens a comparatively simple matter. The whole book is one which will surely be appreciated by lovers of Old French, and which can be recommended to those who desire to become acquainted with some of the literary riches of the middle ages.

The Philosophy of Spinoza. [Series of Modern Philosophers. Edited by E. Hershey Sneath, Ph. D.] By George Stuart Fullerton. New York: Henry Holt & Co. 1892.

The idea of this series of books is to present the substance of the leading systems of modern philosophy in selections from the original works. Its object is to facilitate the study of the history of philosophy in colleges, as well as to meet the wants of clergymen and others who desire to make a pretty thorough, but yet not a professional, study of philosophy. Whether the plan, although it is skilfully executed in this volume, attains its ends as nearly as careful and extended but free expositions would do, may well be doubted. A student who does not want Locke's 'Essay Concerning Human Understanding' (which he can easily procure for about the price of the abridgment) on his shelves, nor Hamilton's 'Reid,' nor Kant's 'Critique of the Pure Reason,' is a person who will not understand selections from these works, and whose wants would be better served by such expositions as modern scholars to whom the several works are specially sympathetic would be able to set forth.

Of no writer is this nearly so true as Spinoza. Nobody but a ripe philosopher, profoundly versed in the history of thought, is fit to read Spinoza's 'Ethics.' A collegian will be sure to miss the essence of it, and any amateur metaphysician whose ideas have not been matured on a special side by deep reading in theology will be almost sure to fall into the same error. The reason is that Spinoza did not understand himself—that may be said of nine out of ten great thinkers, but above all of Spinoza—and consequently was a miserable expositor of his own ideas. That which will chiefly attract the attention of any inexperienced reader of the 'Ethics' is its argumentation and its pseudo-mathematical form; and if he is well versed in modern logic, these can only excite his scorn. If he is not so versed, the kernel of the book will remain still more completely shut away from his apprehension.

Another fault of this series is that not sufficient attention is given to the biographies of the philosophers. Light may be thrown upon any doctrine from the life and personality of its author; but this is particularly true of Spinoza's. Imagine a not very little but rather short Jew, somewhat shabby, but scrupulously neat and almost prim, too formal, though in forms of his own, walking with short steps, talking in short-clipped syllables, of colossal conceit. His morality is stern, not to say narrow. He so values his self-respect that he not only will not accept a pension from his own people, on condition of living like a respectable member of the synagogue, but he will not accept a pension from Louis XIV. without conditions; he refuses his consent to a fortune being left to him, and when the will of the proposed giver enjoins his heir to take care of Spinoza, the latter reduces the yearly payment from 500 florins, which the heir himself had proposed, to 300. In fact, Spinoza carries his love of independence and detestation of being under obligations so far that he will not accept any employment proper to an educated man, but practises a handicraft. He lives his life among artisans and the lower middle class, and meets no other persons except his own devoted admirers. To a man of genius, such a life would have been utterly unendurable; but Spinoza, however extraordinary his ideas, was a sluggish mind. He passed his days in a narrow circle of ideas, concerning which he was continually inventing quillets or catches, more or less puzzling, which he took for arguments. The great ideas of pantheism could not have come to him in that way; but how they did come he does not tell us. He thought that a matter of no consequence, and would have been unable to give any accurate account of it. Nobody has yet elucidated the real nature of pantheistic thought, nor shown its relation to matters of experience. The account usually given, like Spinoza's own, remains on the surface. But we cannot go further into such a subject here than just to remark that the service he performed was to render certain conceptions, as that of the Absolute, more sharp and clear than they had before been, but not to prove any truth.

Prof. Fullerton repeats doubts concerning Spinoza's love affair which appear to us perfectly gratuitous. He did not practically leave Amsterdam when the lady was twelve years old, but when she was seventeen; and the whole history seems to be from every point of view exceedingly probable.

Illegitimacy, and the Influence of Seasons upon Conduct: Two Studies in Demography. By Albert Leffingwell, M.D. With maps and diagrams. Imported by Charles Scribner's Sons. 1892.

It is the avowed ambition of these two essays to make statistics in regard to illegitimate births and to periodicity in human conduct and mental disease, not only easily intelligible, but also interesting. With this double purpose in view, nothing has been omitted which could be gained for clearness and picturesqueness by colored maps, diagrams, a generous distribution of statistical tables throughout the text, and numerous statistical summaries and suggestions in the appendix. Moreover, the style is amiable, and there is something contagious in the enthusiasm of the author—the love of statistics as such, and the buoyant confidence in their ultimate utility which sometimes atones for present inconclusiveness.

The study of illegitimacy relates chiefly to the United Kingdom, with a liberal use of corroborative evidence in regard to other countries. Much of the material comes first-hand from official reports, and conclusions as to local or national peculiarities are drawn from detailed analyses of annual returns covering a considerable number of years. A glance at the returns of the Registrar-General of

Births, Deaths, and Marriages reveals the social import and the local peculiarities of illegitimacy in each of the three principal divisions of the United Kingdom. The number of births registered as illegitimate in England was 42,189 in 1879, and 40,627 in 1889—nearly three times the whole number of children born in Birmingham and Liverpool each year; in Scotland the numbers for these twelve years vary from 10,727 in 1879 to 9,643 in 1889; while Ireland for the same period shows a decline from 3,367 to 3,049. The real significance of these figures is seen in the proportion which these illicit births bear to the total number of children born. In 1878 the proportion of illegitimate to all the children born was, in Ireland 23 to the thousand, in England 47, and in Scotland 84; while the corresponding figures for 1889 are, Ireland 28 to the thousand, England 46, and Scotland 79. In other words, year after year, of each thousand births in Scotland almost twice as many are illegitimate as in England and Wales, and more than three times as many as in Ireland. So persistent are these figures, and so constant is their relation to one another, that the author not only feels warranted in predicting to a nicety the rate for the remainder of the present century, but also feels bound to assume the same local characteristics for earlier centuries, about which there is no available evidence. Indeed, each great political division of Europe seems to have its special illegitimacy average, repeated with considerable regularity from year to year. From the statistical summary covering the years from 1869 to 1889, it appears that Russia is the only European country which in any way disputes with Ireland the honor of the lowest rate of illegitimacy. Holland stands next, with Switzerland pressing close upon the rate given for England and Wales; Italy, France, Belgium, Prussia, Hungary, and Norway approximate more nearly the rate assigned to Scotland, while Denmark, Sweden, Saxony, Bavaria, and Austria follow in order, with 93, 101, 125, 141, and 147 illegitimate children per thousand births in 1889.

Passing now from these larger political or national units to still smaller ones, we are confronted with the still more remarkable fact that not only each country, but each department, county, city, and neighborhood, has its own peculiar tribute of bastardy, yielded with almost unfailing regularity to the sum total of the nation. The evidence on this point is given in detail. Ireland does not differ more widely from England and Scotland than the Irish counties differ from one another; and the same is true of England, Scotland, and Continental countries. In England it is hardly fifty years since the first attempts were made to get at these figures; but the persistence of local standards of morality is forcibly illustrated by the fact that the very counties where an abnormally high rate of illegitimacy prevailed in 1842 have retained their unenviable preëminence for half a century. If we adopt still another test, and state the proportion of illegitimate births to each thousand unmarried women (spinsters and widows) between the ages of fifteen and forty-five, the average during the ten years from 1878 to 1887 is over 21 per thousand in Scotland, 14 per thousand in England and Wales, and rather less than 5 per thousand in Ireland —a proportion about five times greater for Scotland than for Ireland.

How are these variations to be accounted for? What, in short, are the causes of illegitimacy? Poverty, it is often alleged, is the chief cause. Yet how, upon this supposition, shall we explain why the rate in Ireland is so much lower than in England and Scotland? Nay, even, how account for the still more striking fact that in Ireland, a section of the prosperous county of Ulster yields an average of fifty-one illegitimate children per thousand births—greater even than England and Wales—while a wretched barren in Connaught shows what is perhaps the lowest ratio of illegitimacy in Europe? Is, then, illegitimacy but a part of the demoralization of modern city life? Alas for bucolic virtue, even when allowances are made for faulty registration, London, Birmingham, and Liverpool would seem to have a much lower proportion of illicit births than North Wales, Westmoreland, Cumberland, and Shropshire. In certain secluded sections of England and Wales "every sixth or seventh or eighth child is a bastard," and the rate in certain counties increases with the distance from the metropolis. Doubtless there is faulty registration in large towns, and unfathomed dissipation; but the rural standard of sexual morality suffers strangely in this superficial comparison of official returns. In like manner, the variations are not to be accounted for by differences in secular education. Good morals and a high standard of elementary education do not always coexist: witness the high rate of illegitimacy in Denmark, Norway, Sweden, Prussia, Saxony, and Scotland, as contrasted with the minimum in Russia and Ireland.

Does religious training furnish any key to the mystery? Our author thinks it does. Yet the inadequacy of such an explanation is seen in the immense local variations in the same country and in different countries with the same religion. Nevertheless, it is in religion, and in legislation and legal impediments to marriage, that he finds a partial explanation. For the rest, the irreconcilable differences in regard to the local prevalence of illegitimacy are referred to the convenient limbo of "heredity." The result is a somewhat fantastic tracing back of the lines of local ancestry to Celts, Romans, Angles, Jutes, Saxons, Danes, and Normans, "to the different strains of English blood making themselves felt in individual conduct even after a thousand years of unity as a nation." At all events, we are told, this hypothesis "possesses one remarkable advantage: it explains phenomena otherwise inexplicable." All this indictment of piratical ancestry is supplemented by numerous statistical tables and colored maps, which make the mingling of fact and fancy interesting. Brief discussions of remedies, of the tendency to improvement, of the ages and occupations of the women involved, and of the alleged compensations for illegitimacy in the way of great names, complete the study.

The second essay of the volume, the influence of seasons upon conduct, is likewise dedicated to the proposition that it is the unexpected which happens. It is not the gloom of winter and the season of poverty and distress that goads men oftenest to suicide, insanity, violence, and murder. It is the gradually increasing light and heat of spring and summer that swells the birth-rate, legitimate and illegitimate, rouses the passions, precipitates divorce, murder, assaults, duels, riots, love, suicide, and revolution. The theory is not a new one. It is the planets which control our destinies—or perhaps the spots upon the sun. The American Revolution is reduced to "cosmic" influence, and the patriotic frenzies of July Fourth but coincide with other rash emotional and mental aberrations. Unfortunately, the author has confined himself largely to the morbid aspects of "cosmic" influence, though it is evident that the emotional exaltation and quickening life of spring is not confined to criminal and pathological channels of expression. The suggestions as to seasonal activity in reproductive instincts add nothing to Westermark's discussion of the subject. The statistics, however, are interesting, and are presented with a naïve enthusiasm characteristic of the book.

A Text-Book of Physics. By Edwin H. Hall and Joseph Y. Bergen, jr. Henry Holt & Co.

THIS little book has been prepared on the basis of the Harvard College "Descriptive List of Elementary Physical Experiments," of which it may be regarded as an expansion. In 1886 the College decided to establish a requirement of laboratory work to be recommended in place of text-book work, though the latter, considerably increased, remained as an alternative for those who could not command laboratory facilities. A special course of experiments, carefully thought out and described in detail, was necessary to make the new plan a success; and this was furnished in a pamphlet issued by the College in 1887, which has been very successful. The work before us is a supplementary text-book, which contains the full text of the College pamphlet, with minor experiments, discussion, and problem work. The book itself is in all respects excellent, and must exert a marked influence on the teaching of physics in this country.

We note a few omissions which may be worthy of consideration. The method of weighing by vibrations is not too difficult for the beginner, and is now almost universally adopted, especially by chemists. A good spring balance, with a strip of brass moving stiffly in its slot, so as to register the maximum extent of motion of the index, and a kilogramme weight, may be made to give very clear ideas of inertia under different conditions of velocity as well as of so-called centrifugal force. Some of the statements are only approximately true in cases in which the exact truth is not difficult of comprehension. This applies, for instance, to the statement of the law of Boyle. The experiment of Archimedes should be followed by the complementary experiment, easily made with a platform balance, a tumbler of water carefully balanced, and a weight suspended from a fixed point by a string. These are perhaps trivial criticisms, but such books ought to require none.

BOOKS OF THE WEEK.

Bastable, Prof. C. F. Public Finance. Macmillan. $4.
Bazán, Emilia P. A Christian Woman. Cassell. 50 cents.
Bernhardt, W. Hauptfakta aus der Geschichte der deutschen Litteratur. Boston: Schoenhof. 75 cents.
Bissell, Prof. E. C. Genesis Printed in Colors. Hartford: Belknap & Warfield. $1.25.
Bristol, G. P. Ten Selected Orations of Lysias. Boston: Allyn & Bacon. $1.
Browning Year Book. E. P. Dutton & Co. $1.
Cave-Browne, Rev. J. The History of Boxley Parish. Maidstone, Eng.: E. J. Dickinson.
Chapin, Rev. A. C. Manzoni's I Promessi Sposi. Paris: Hachette; Boston: Schoenhof. 75 cents.
Chardenal, C. A. Complete French Course. Boston: Allyn & Bacon. $1.
Dickens, Charles. Martin Chuzzlewit. Macmillan. $1.
Dickens, Charles. Old Curiosity Shop. Macmillan. $1.
French, H. W. The Lance of Kanana. Boston: D. Lothrop Co. $1.
Garner, R. L. The Speech of Monkeys. Charles L. Webster & Co. $1.
Genone, Hudor. The Last Tenet. Chicago: Charles H. Kerr & Co. 50 cents.
Keasbey, E. Q. The Law of Electric Wires in Streets and Highways. Chicago: Callaghan & Co. $3.50.

Lee, Rev. J. W. The Making of a Man. Cassell. $1.50.
Parker, Theodore. Lessons from the World of Matter and the World of Man. Chicago: Charles H. Kerr & Co. 50 cents.
Payne, E. J. History of the New World Called America. Vol. I. Oxford: Clarendon Press; New York: Macmillan.
Reddall, Frederick. The Sunny Side of Politics. St. Paul: Price-McGill Co. 50 cents.
Williams, Prof. S. G. The History of Modern Education. Syracuse, N. Y.: C. W. Bardeen. $1.50.
Wood, J. S. Gramercy Park: A Story of New York. Appletons.

HENRY HOLT & CO.'S (29 West 23d Street, New York)

EDUCATIONAL WORKS,

LATELY PUBLISHED:

ALLEN'S LABORATORY MANUAL OF ELEMENTARY PHYSICS. By CHARLES R. ALLEN, S.B., of the New Bedford (Mass.) High School. Pupils' Edition, pp. 208, 12mo, by mail, 88c.; Teachers' Edition, pp. 277, by mail, $1.10.

Most of these exercises exact of the pupil measurements of some sort. They are carefully adjusted to the usual text-book study and lecture-table demonstrations. They are planned for young beginners, employ no elaborate and unduly expensive apparatus, and are so framed that the pupil can prepare himself beforehand to make the most of his time there with the least help from his instructor. The teachers' edition contains much suggestive matter upon the simplification and home construction of apparatus, time-saving devices, etc.

AUBERT'S COLLOQUIAL FRENCH DRILL, PART II. By Prof. E. AUBERT of N. Y. Normal College. 16mo. By mail, 70c.

BALDWIN'S PSYCHOLOGY—FEELING AND WILL. By Prof. J. MARK BALDWIN of Toronto University. 8vo, pp. 344. By mail, $2.16.

BENDIX'S DR. WESPE. Ein Lustspiel. 12mo, boards; by mail, 28c.

BLACK & CARTER'S NATURAL HISTORY LESSONS. Part I., for Primary Grades. By GEO. ASHTON BLACK. Part II., for Grammar Grades. By KATHLEEN CARTER, Assistant Teacher of Botany in Barnard College. 12mo (handbooks for teachers), 108 pp. By mail, 54c.

BRIGHT'S ANGLO-SAXON READER. Edited with Notes and Glossary, by JAMES W. BRIGHT of Johns Hopkins University. 12mo, 385 pp. By mail, $2.10. Contains graded texts, from the easiest to the more difficult prose, with several admirable poems, all carefully edited and annotated. The glossary defines all the words in the texts, furnishes much grammatical information, and gives etymological hints.

BRONSON'S COLLOQUIAL GERMAN. By T. B. BRONSON of Michigan Military Academy. A handy book for student or tourist. A collection of English sentences to be put into German. These sentences are remarkably natural, and embrace nearly all the needs of ordinary, necessary, or chance intercourse in a foreign land. 16mo, pp. 174. By mail, 70 cents (Key, 70 cents).

BURNETT'S STORM'S IMMENSEE. Novelette, with introduction, notes, and vocabulary. Ed. by A. W. BURNETT. 12mo, boards, 109 pp.; by mail, 28c.

HYDE'S PRACTICAL ETHICS. By Pres. WM. DEWITT HYDE of Bowdoin. 12mo, 219 pp.; by mail, 89 cents. While this book was written primarily for schools, it is not unsuited to the uses of the two lower classes in colleges.

There is no metaphysical deduction from first principles, but simply the presentation, in a rational and intelligible order, of the concrete facts and consequences of conduct. The aim is practical throughout. Duties and virtues are commended, not by exhortation, but by showing the place they occupy and the part they play in a coherent system of truth and a symmetrical development of character.

VON JAGEMANN'S ELEMENTS OF GERMAN SYNTAX, with Special Reference to Composition. By Prof. H. C. G. VON JAGEMANN of Harvard. 12mo, 175 pp. By mail, 89 cents. The author presents German syntax from the point of view of the English language, instead of that of general descriptive grammar. His treatment is based upon a carefully prepared list of difficulties which he has found pupils most frequently meet in translating English into German.

JAMES' PSYCHOLOGY—BRIEFER COURSE. By Prof. WM. JAMES of Harvard. American Science Series, 12mo, 478 pp. By mail, $1.68. Two-fifths rewritten; the rest taken from the Advanced Course. (2 vols., 8vo, 1,393 pp. By mail, $5.32.)

MANNING'S SPANISH GRAMMAR. By Prof. E. W. MANNING of De Pauw. A concise and practical handbook with many exercises. The only book of its kind in English. 16mo, pp. 242. By mail, $1. 6.

SHAW'S ENGLISH COMPOSITION BY PRACTICE. By Prof. EDWARD R. SHAW of the University of the City of New York. 12mo, illustrated, 215 pp. By mail, 83 cents. Complete apparatus for High School work. Attractive stories and sketches are studied, and the pupil led to observe the application of the simplest principles of composition. Rules are then formulated on the basis of this observation. Considerable space is given to exercises for original compositions.

SNEATH'S SERIES OF MODERN PHILOSOPHERS. Extracts from their works (translated when necessary), with lives, bibliographies, and notes, under the general supervision of E. HERSHEY SNEATH of Yale University. 12mo. cloth.

RUSSELL'S JOHN LOCKE. By Prof. JOHN E. RUSSELL of Williams College. 160 pp. By mail, $1.10.

TORREY'S DESCARTES. By Prof. HENRY A. P. TORREY of the University of Vermont. 367 pp. By mail, $1.62.

FULLERTON'S SPINOZA. By Prof. GEORGE S. FULLERTON of the University of Pennsylvania. 210 pp. By mail, $1.30.

SNEATH'S REID. By Dr. E. H. SNEATH of Yale. 375 pp. By mail, $1.62.

WATSON'S KANT. By Prof. JOHN WATSON of Queen's College (Canada). 366 pp. By mail, $1.87.

WHITNEY'S INTRODUCTORY FRENCH READER. By WM. DWIGHT WHITNEY and M. P. WHITNEY. 16mo, pp. 245. By mail, 71 cents. Can be begun after a few lessons in grammar. Composed of easy pieces, ranging from the simplest fairy tales to the more difficult prose of history and fiction. All the matter is easy enough to present no unnecessary obstacle to rapid reading, interesting enough to hold the attention, and varied enough to serve as an introduction to any reading that will be apt to follow. There are ample notes, including grammatical references and a vocabulary.

WHITTLESEY'S (M.) VON HILLERN'S HÖHER ALS DIE KIRCHE. With notes, vocabulary, and frontispiece. Edited by MILLS WHITTLESEY of the Lawrenceville (N. J.) School. New edition, carefully revised. 12mo, boards, 96 pp. By mail, 29 cents.

For list of Henry Holt & Co.'s forthcoming educational works, send for their Educational Catalogue (which contains further particulars about the works in this advertisement) or see next week's *Nation*. Liberal terms for introduction and exchange. Catalogue of Miscellaneous Works free.

GROSBY'S VITALIZED PHOSPHITES

The *only* Brain and Nerve Food from the phosphoid principle of the *ox brain* and embryo of wheat.

Largely used, with best results, for *preventing*, as well as curing nervous breakdown.

It restores weakened mental and physical vigor.

It is a *vital* PHOSPHITE, not a laboratory PHOSPHATE.

Pamphlet, with full information, free.

F. CROSBY CO., 56 WEST 25TH ST., N. Y.

Horsford's

ACID PHOSPHATE,

Recommended and prescribed by physicians of all schools

FOR

DYSPEPSIA, NERVOUSNESS EXHAUSTION,

and all diseases arising from imperfect digestion and derangements of the nervous system.

It aids digestion, and is a brain and nerve food.

Descriptive Pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

Our new **Book Catalogue** not only gives the size and price of all the standard works on Homœopathy, but an interesting description of each, together with opinions of the press and of physicians. Mailed free.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 1, 1892.

The Week.

THE correspondence between Secretary of State Foster and Mr. Herbert, the British Chargé d'Affaires, narrows itself to the single question whether the promise of the Canadian Government to abolish the discriminating rebates after the close of the present season ought to be taken as a sufficient concession on their part, and whether the President ought therefore to have withheld his proclamation regarding tolls on the Sault Ste. Marie Canal under the recent act of Congress. Mr. Foster shows that no option was left to the President by the act referred to. If he was satisfied that the discrimination existed, he was to issue the proclamation. He had discretion as to the amount of the toll to be levied at the Sault Canal, but not as to the levying of some amount. It would have been mere affectation for the President to say that he was not satisfied of the fact of discrimination when that fact had been admitted by the other side, and was sought to be defended on various grounds. Being convinced of the fact, he had nothing to do but to determine the amount of the tolls to be imposed on Canadian vessels or property passing through the Sault Canal, and in this he was certainly moderate. It would have been better, in our view, if Congress had made the act prospective in its operation. If it had provided for the imposition of tolls at the Sault after the close of the present season, probably all friction would have been avoided. As the matter is of small moment any way, it would have been worth the taking of some pains to avoid a difficulty.

Premier Abbott inherited this embarrassment from Premier Macdonald. That thrifty statesman found it necessary, in a certain political emergency, to conciliate the town of Kingston in order to get votes. He accomplished his end by making a discriminating rebate of canal tolls, the effect of which was to make Kingston a better transshipping point than Ogdensburg. The discrimination was in violation of the spirit of the treaty of Washington, if not of its letter. That treaty secures "to the citizens of the United States the use of the Welland, St. Lawrence, and other canals of the Dominion on terms of equality with the inhabitants of the Dominion." The refund of tolls to Canadians after the vessels have passed through is a violation of this provision, and the Canadian Government has acknowledged that it is such by promising to discontinue it at the end of the present season. Still, as a matter of comity, we should have preferred that our own Congress had taken a little more time or left a little more room for Premier Abbott to "crawl out."

President Harrison made a short speech at Malone on Friday. The greater part of it related to the restoration of our ocean-carrying commerce, which he believed was an event not far distant, and a consummation greatly to be desired. "I take great delight," he said, "in the contemplation of the fact, which, I believe, is now assured, that before another year has rolled around one of the swiftest and best of all the great lines of steamships that go out of the port of New York will bear the American flag at the fore." The President's naïve delight arises from the fact that Congress, in violation of the great principle of protection and of our wonderful navigation laws, has admitted two foreign-built steamships to American registry. Of course this might have been done before, in which case Mr. Harrison's heart might have been cheered years and years ago. In his remarks at Malone he had the grace to say that by the restoration of our ocean-carrying trade we should merely recover a position that we formerly held. "We have been deprived," he said, "of our once proud participation in the ocean carrying trade of the world. I think we should now resume it." The thing which has mainly prevented us from resuming it heretofore has been the prevalence of an opinion that a cheap coat makes a cheap man, and that a cheap ship makes a cheap country. The gradual disappearance of such crude notions will no doubt cause the United States "to step into the position of power and influence among the great commercial nations of the world" which Mr. Harrison now so fondly predicts.

There appears to be a commendable disposition at the State Department to go slow and be sure of the facts in the case of the six Venezuelans forcibly taken from an American merchant-ship in Puerto Cabello. Venezuelan affairs are in such a chaotic condition at present that it is difficult to say who was the representative of the legal authority over that harbor at the time; but it seems clear that the seizure was made by proper legal process under the *de-facto* authorities. If this proves to be the fact, the parallel between this affair and the Barrundia case will be close, and it will be interesting to note whether our Government is again prepared to assert its jurisdiction in foreign waters. The test question to put to Americans in such a dispute is the one asked by Prof. Woolsey in his recent article: "Suppose the *Trent*, with Mason and Slidell on board, had sailed into New York harbor, would the right of their seizure have been questioned by any power on earth?"

It was only a few days ago that the Washington correspondent of the Philadelphia *Ledger* was severely rebuked by the *Press* of the same city for telling the truth about the condition of the Treasury. He was reminded that it ill became a man who had been "honored" by the Republican party (meaning that he had been made Clerk of the Ways and Means Committee) to call attention to the fact that the Treasury was bankrupt, even if the fact were so. But he returned to the subject in Friday morning's *Ledger* undismayed, saying that his "facts and figures may not be relished by partisans, but it is due to the public that they should be fairly stated." He reaffirms the bankruptcy of the Treasury in the sense that "the appropriations made by Congress for several years have been in excess of receipts," and that Secretary Foster has been forced by lack of funds to "defer" "claims against the Government" and appropriations for "the construction of public works." This has been no secret, of course, in spite of Mr. Foster's perfunctory denials, but it is well to have the truth thus frankly set forth by a Republican authority who thinks it his first duty to be honest. He quotes Senator Allison as saying that "after this year we are likely to have a deficiency, which must be met by an increase of taxes." This seems a good place to recall a remark made by Senator Hale, when he was protesting, in the name of Mr. Blaine, against the removal of the sugar duties: "I do not, for one, Mr. President, envy the future of any party that takes off taxes this year and is obliged to reimpose them next year."

The reason assigned by Mr. Sweeney, the leader of the switchmen at Buffalo, for declaring the strike "off" was, that "we can't fight 8,000 militia and twelve powerful railroad corporations." This short sentence comprises the whole philosophy of the strike and of most strikes in this country. It implies that the strikers could carry their point if they were allowed to take possession of the property, burn cars, throw trains off the track, and kill or maim all persons seeking employment in the places they have abandoned. But if the officers of the law do their duty, if they afford that protection to life and property which it is the main object and purpose of Government to supply—which is nine parts of the functions of civilized society—then Mr. Sweeney and his troop of a few hundred men are compelled to acknowledge themselves beaten. When the outrages at Buffalo began, we were assured by Sweeney that they were

the work of roughs and tramps who are always ready for a disturbance in every large city, and that the switchmen were models of good deportment. They were ready even to mount guard over the property of the companies and prevent the disorderly elements from doing any damage. But now it appears that the strike is off simply because too many men had mounted guard over the property and too much coercion had been applied to the disorderly elements. The protection was altogether too complete and thorough. It must be said for Mr. Sweeney that he was not solely to blame for what took place at Buffalo. The strike was ordered by the switchmen as a body, and not by the Grand Master on his own responsibility.

The failure of Hugh O'Donnell, leader of the Homestead strike, to draw a crowd to hear him in Cooper Institute last Thursday, is an encouraging indication. Only a handful of people attended, and O'Donnell got scarcely more than enough money to pay the rent of the hall. Various reasons are given for the slim attendance: the weather was very bad, and it was announced in advance that in addition to an admission fee of twenty-five cents a collection would be taken up at the close. Both these reasons may have been sufficient to keep many people away, but they would not have operated in that manner a few years ago. The real cause of the meeting's failure is undoubtedly the change of public sentiment which has taken place even among the workingmen themselves towards strikes and the leaders of them.

The excellent conduct of the militia at Buffalo is deservedly calling forth praise from all quarters. Their duty has been far from a pleasant one, but they have performed it without complaining and with really remarkable steadiness and self-control. The service was entirely novel to them, yet they have gone through it like veterans rather than like green troops. Taken in connection with the equally commendable behavior of the militia at Homestead, the experience at Buffalo affords ample assurance that in its citizen soldiery society has a safe and sure protection against outbreaks of anarchy in any form.

The observations by Mr. T. V. Powderly upon the workingmen's expectation of benefits from the protective tariff, will furnish food for a good deal of solemn Republican thought. Mr. Powderly says that "our Government has enacted protective legislation in the interest of labor," and that, having done this, it "quiescently allows the manufacturer to absorb the bulk of protection." As authority for this view he points to Republican Congressional speeches, saying that "in discussion on the tariff laws it was never advanced as a reason why they should be passed that capital would be protected—the argument always was that labor should be protected." He declares that the Homestead troubles would have been averted if, when the managers of the Carnegie concern sought to absorb all the protection, Government had interfered in behalf of the workingmen. "If we must have protection," he adds, "let us see to it that it protects the man who works." Is Mr. Powderly right or wrong in his claim that he finds authority for his position in the speeches of Republican Congressmen? Everybody must admit that those speeches have for years been teaching the same doctrine which he insists upon now—namely, that the high tariff is designed primarily to keep American wages above the level of the pauper labor of Europe. In the current number of the *North American Review* Senator Morrill preaches the same doctrine when, in reviving the old "free-trade scare," he says: "Free trade builds up a few great important cities on the seashore, and creates millionaires in foreign trade. It depopulates the rural districts, and has nothing but lip-service to offer those who toil for their daily bread. *It would give to the latter the dearer cost of living and the 77 per cent. less of wages* which free trade in England offers to those who labor." The same doctrine has in every Presidential campaign for years been displayed on countless Republican banners in the familiar form: "American Protection for American Homes—American Wages for American Labor." Small wonder if Mr. Powderly and his associates, having accepted it as truthful, now turn about and demand its enforcement by its inventors.

The *American Wool and Cotton Reporter* has a sarcastic article entitled "The Political Arlington Mills." These are the woollen mills presided over by Mr. William Whitman. The *Reporter* finds it a matter for wonder that, if Mr. Whitman is able to make only 6 per cent. per annum out of his tariff combination with the Ohio wool-growers, he should continue in that combination. Other woollen manufacturers, who are not in the combination, make 10 per cent. dividends. How does it happen that Mr. Whitman makes less? The explanation is that Mr. Whitman's "participation in law-making has recently put more than 6 per cent. into the assets of those mills in such form as to be available as quick capital, if not practicable for immediate withdrawal as dividends." That there is something mysterious either in the company's financial statements or in Mr. Whitman's personal statements, the *Reporter* shows by publishing the financial statements for two successive years, namely, 1891 and 1892. Mr. Whitman has explained that the profit and loss balance in the 1892 statement (viz., $932,809) was an accumulation of former years; but the profit and loss balance of 1891 (viz., $984,769) was actually larger than that of 1892. This would show a decrease instead of an accumulation, but somehow the Arlington Mills stock rose in the market from 82½ to 108, and Mr. Whitman himself has been in the market as a buyer of it, having increased his own holdings from 514 shares in 1889 to 1,164 shares in 1891. The *Reporter* points out the true sources of the Arlington's prosperity. It says:

> "The facts are that the Arlington Mills were financially weak in 1889, and have become financially strong in 1892 *through the ability of Mr. Whitman to frame certain phrases of the McKinley Bill in the interest of his mills.* Mr. Whitman was able to do this by swallowing his previously announced convictions at the behest of Messrs. Lawrence and Delano, and by allying himself with the Ohio clique. He has achieved a considerable measure of prosperity thereby, but he might have achieved the same measure of prosperity by a tariff law which would have benefited the great mass of wool manufacturers as well as the Arlington Mills."

It is evidently worth while to be President of the American Wool Manufacturers' Association if by that means you have the last hack at the bills which are nominally prepared by the Committee of Ways and Means.

The importance which the Republican press attaches to Peck's report shows its desperate poverty in argument. The figures simply give the statements alleged to be made by 6,000 firms engaged in sixty-seven "industries," representing 1,121 "trades," as to the amount paid by them for wages in the year from September, 1889, to September, 1890, and in the following year, and the value of their products during those years. As to what has taken place during the year that ended yesterday, no information is given. Mr. Peck says that these industries "give employment to 285,000 workingmen and women," but his summary contains no figures upon this point, nor do we know to how many persons these industries gave employment during the former of the years taken for comparison. The figures show that $6,378,000 more was paid for wages in the second year than in the former, but as we do not know how many persons were employed in the former year, it is impossible to tell anything about average earnings. From what we know of the previous work of this "statistician," we incline to think that he has simply divided the increase reported in wages by the number of employees in the second year taken. If he has not done this, his figures ought to show that these "industries" are employing scarcely any more men in the second year than in the former. As to the increase in the value of products reported, it is impossible to judge of its significance, as we do not know the gross amount for either year or the quantity of goods to which this value is attributed by their anonymous producers. Meanwhile we must say that destiny has already marked Mr. Peck out as the Superintendent of the next census, should the Republican party be then in power.

There appears to be no doubt that the Republican managers in Maine, led by "Joe" Manley, have been guilty of a disreputable piece of trickery in the printing of the ballots which are to be used in the approaching election. The new ballot law of the State is to be tried for the first time. It provides for a party-group ballot, in accordance with modifications of the Australian adopted in several of the States. The names of all candidates are to be arranged in party groups upon a blanket ballot, and the voter can indicate his choice either by placing a mark opposite the party name at the top, or by placing a mark against the name of each candidate for whom he wishes to vote. In all laws of this kind, except that of Maine, the blank spaces for the marks are placed *before* the names of the candidates—that is to say, to the left of them. In the Maine law, the direction is that the blank spaces shall be placed at the right of the names, that is, after them. In printing the ballots according to this direction, the Secretary of State in Maine has arranged them as follows:

REPUBLICAN.		DEMOCRAT.	

As the natural place for marking or checking a name is before, not after it, the effect of this arrangement would be that careless Democratic voters would put their marks in the space following the names on the Republican ballot, and their votes would thus be registered and counted as Republican. No other similar law in the country has such an arrangement. Some of the laws have the marks placed after the names, but the blank spaces are so arranged that a mistake is impossible. To understand how such a trick happened to be provided in the Maine law, it is necessary to recall the fact that the Republican Machine there, under Manley's lead, fought the adoption of the reform law in the Legislature, and yielded their opposition only in obedience to the demands of overwhelming public sentiment. Not content with this, the Secretary of State has had the ballots printed on such flimsy paper that the voter's mark on it can be seen easily through it, even after the ballot has been folded, so that the secrecy of the ballot is impaired, if not completely destroyed. The Democrats have discovered the marking trick in good season and are making every effort to warn their voters of the dangers of it; but they are likely to lose many votes in consequence of it.

There is a pretty loud demand in certain newspapers that the President shall issue a proclamation prohibiting immigration while the cholera continues in Europe. Those who make such a demand seem not to be aware that the President has no more power to prohibit immigration than he has to prohibit importation or exportation. Moreover, how is he to distinguish between immigrants and American citizens returning to their own homes as steerage passengers? Are people to be excluded from their own homes merely because they are not able to travel in the cabin? Nothing, we venture to say, will be gained by mixing the questions of immigration and of quarantine together. What is desired on all hands is to keep out cholera-infected persons, whether native or foreign-born, whether citizens or immigrants. How to do this is a medical question purely, and is to be decided by the faculty, and not by the President or any political authority. There is no occasion for getting in a panic on this subject. No person infected with the cholera germ can go five days without being sick in such a way as to disclose the true character of the disease. No ship can cross the ocean in five days. Therefore, no quarantine officer can be deceived. The outbreak has already had a deleterious effect on our export trade. One of the largest houses in the city in this line reports that it has not booked a new order in ten days. No shipowner wishes to send his vessel to an infected port. No captain or crew desires to tempt fate in that way. Hamburg is one of the world's great entrepots. It is the chief distributing point of northern Europe. Business is completely paralyzed there, and many of the merchants have fled from the city. Havre is likewise a great port, a most important one for our foreign trade. Antwerp is likewise of much importance to us. The reported presence of cholera in Antwerp is contradicted, but as long as a doubt exists no ship will solicit a cargo for that port, except the regular liners. Thus, a temporary glut of the markets in certain lines may be looked for here, and a corresponding dulness of general trade due to the caution which accompanies every disturbance of the settled course of things. Fortunately, the period of frost is not far distant.

The success of Mr. John Morley at Newcastle is one upon which the Liberals may congratulate themselves for several reasons. In the first place, he is Mr. Gladstone's right-hand man and chosen instrument in all home rule matters, so that his defeat would have been taken to argue Liberal lukewarmness on the Irish question. Of course he would have had a seat made for him elsewhere if defeated, but that would have been a mortifying expedient. His triumph, and by a larger majority than was hoped for, cannot fail to strengthen and solidify the new Cabinet. Its determination to put Irish affairs first has now this new and cheering endorsement. Moreover, his election is a fresh dashing of Conservative hopes, as their unexpected success in winning one seat at Newcastle in the general election made them confident of beating Morley on Thursday.

The memorandum concerning the coinage of silver addressed by Dr. Soetbeer to the International Monetary Conference is subjected to rather destructive criticism by a correspondent of the London *Economist*. Dr. Soetbeer's principal suggestion was that no gold coins or bank-notes payable in gold under the value of twenty francs should be hereafter issued, and that those now outstanding should be withdrawn. He puts the amount of small gold coins at about £82,000,000, the total amount of such coins and of small notes being estimated by other authorities at £150,000,000. Dr. Soetbeer's critic points out that this is far below the quantity of full-rated silver already circulating, or more properly, we should say, held by Governments as available for monetary use. The United States and France alone have from £220,000,000 to £250,000,000, and the total in all countries is probably not less than £600,000,000. If the silver-using countries were to adopt the gold standard, using silver as suggested by Dr. Soetbeer, there would still be a vast surplus of silver. Dr. Soetbeer says these countries might be able to get rid of a portion of this surplus in time, but he does not say who is to take it.

M. Paul Leroy-Beaulieu has attacked vigorously the project for resuming work on the Panama Canal. He believes that all the new money put into it will be lost as the former amounts were. That France has any peculiar interest in cutting the isthmus, whereby patriotic feeling ought to be enlisted in its favor, he denies. On the contrary, he maintains that "the cutting of this isthmus will favor the United States at the expense of Europe as regards trade with the entire Pacific Coast and the waters of China and Australia." French prestige and *amour propre* are not concerned, he thinks, in the fact that a certain number of French citizens have undertaken a great enterprise and have failed in it. "No harm has resulted to the French name," he says, "and this check is no reason for pursuing indefinitely an enterprise singularly hazardous. It concerns only a matter of business purely financial, very risky, and which should be examined without getting excited." M. Leroy-Beaulieu evidently thinks that it is the weakness of the French character that it cannot look at Panama without getting excited, for he goes on to sketch a plan for getting the money if it must be done. In the first place, he dismisses the idea of a Government subsidy or guarantee as too idle to be considered. The work must be carried on by private subscription if at all. The smallest sum of new stock subscription that would serve as a basis for new loans would be $60,000,000 to $80,000,000 cash. Whether this amount can be raised as a speculation (as it might be invested in a lottery), he expresses no opinion.

THE READING RAILROAD COMBINATION.

THE decision of Chancellor McGill of New Jersey, enjoining the operation of the Central Railroad by the Philadelphia and Reading, could hardly have been unexpected by the managers of these companies. The Chancellor examines the statute of 1885 prohibiting the leasing of domestic to foreign corporations without legislative sanction, which the companies failed to obtain, and declares it constitutional. It follows that the lease of the Central Railroad, a New Jersey corporation, to the Port Reading Company, was not only without legal sanction, but in direct defiance of the legislative prohibition. As we understand the decision, if these companies had secured the passage of an enabling act, the lease would have been valid, but Gov. Abbett's veto disappointed their expectations, as well as those of the legislators who voted for the bill on the understanding that he would approve it.

Such being the case, the consideration of the other features of the transaction does not seem to have been indispensable, but the Chancellor devotes much space to a review of the situation. He expresses the opinion that the Central Railroad has acted in a manner prejudicial to the interests of the public in order to make undue gains for its stockholders, and holds that, in such a case, the Attorney-General of the State may properly institute a suit in equity to restrain a corporation. The prejudicial action consists in leasing its lines to a corporation interested in a business that should be competitive, the transportation of coal. It is true, the Chancellor says, that neither of the railroads concerned owns any coal lands or deals in coal. But they own the majority of stock in two great coal companies, so that their allegations as to ownership of coal lands are "but disguise and evasion." "To say that these conditions do not tend to a disastrous monopoly in coal," Chancellor McGill declares, "would be an insult to intelligence." He adds :

> "The commodity in which these companies deal is a necessary of life in this State. It is the principal fuel of its homes and factories. The slightest increase in its price is felt by a population of hundreds of thousands of persons, for their necessity compels them to pay that increase. If once a complete monopoly be established by the destruction of competition, whether that be through lease or co-operation, the promoters and sharers in it may have whatever price their cupidity suggests. The disaster which will follow cannot be measured. It will permeate the entire community, furnaces, forges, factories, and homes, leaving in its trail murmurs of discontent with a government which tolerates it, and all the other evil effects of oppression."

It is obvious that in this portion of his opinion Chancellor McGill travels outside of the realm of law into that of economics. It is quite too hasty a conclusion that there may not be a saving of expense arising from the combination of competing agencies, although, of course, the saving of expense need not be made a gift to the public, either in whole or in part. And it is absurd to say that the promoters of the combination, if they could establish a complete monopoly, may obtain "whatever price their cupidity suggests." On the contrary, every rise in the price of anthracite coal tends to reduce consumption, and the point is very soon reached where the sale of the reduced quantity at the higher price brings in less profit than the sale of a greater quantity at a lower price. It is those who ignore this law that "insult intelligence." The history of the copper syndicate is an admirable illustration of its working. Those speculators controlled the world's production of copper, and they thought they had the world at their mercy. They put up the price to an extravagant figure, thinking they had made their fortunes, and they found themselves suddenly ruined. Some of those who used copper ceased to use it, some used other materials, some used old copper instead of new, all economized, and M. Secretan and his ring were hoist with their own petard.

Anthracite coal is not a commodity that will endure arbitrary fluctuations in price any more than copper. It is exposed to a steady and formidable competition from bituminous coal, to a considerable competition from wood, to a great possible competition from oil and gas. It is also, we rejoice to believe, in immediate danger of competition from the coals of Nova Scotia, which will be admitted free as soon as the Republicans are turned out of office. Every rise in its price makes this competition more effective. Every rise limits domestic consumption. People of small incomes do not waste so much coal when it is dear as when it is cheap, and people of small incomes are the great majority of consumers. Some of them will calculate that a wood fire will answer their purpose better than one of coal, some will decide to put in a gas-range or depend upon an oil-stove, and nearly all of them will pay only the same amount for coal that they paid before, because they can pay no more. The ability and the disposition of consumers are a perpetual check to the greed of monopolists.

After all, the controversy is a battle of abstractions. As Chancellor McGill admits, and as President McLeod defiantly asserts, what was intended to be done by a lease may as well be done by an understanding. The corporations are mere legal fictions. What is real is the body of men who own the coal and the railroads. These men have generally acted upon a tacit or secret understanding, and the fact that their understanding is now more perfect and extensive than before will make little difference. President McLeod says that the traffic arrangements between the Reading and the Central will not be changed, being mutually advantageous. The titles borne by certain officers will be changed, but not their functions. And, what is most important, the price of coal will not be changed, at least in consequence of this decree. As Mr. McLeod points out, the price for which that commodity sells is beyond the jurisdiction of a Court of Chancery, and he adds that it would be possible for the Reading Railroad to dispose of all its coal without entering the State of New Jersey. This is rather foolish talk, and Mr. McLeod's course is perhaps not altogether a wise one. The price of coal was probably abnormally low last year, but it has been advanced at so rapid a rate as to produce irritation.

PECK'S REPORT.

A REPORT was given to the press on Monday from C. F. Peck, the ridiculous person who holds the position of Chief of the Bureau of Labor Statistics of New York. It is entitled the "Effect of the Tariff on Labor and Wages," and it is hailed by the chief Republican organ as a great campaign document for that party. We do not think it will have the effect ascribed to it, because it is impossible for anybody of Peck's calibre to do any great amount of harm. It requires a man of considerable ability to handle statistics so that he will not contradict himself, or contradict higher authorities than himself. Peck became the laughing-stock of statisticians when he made his first report five or six years ago. Since that time he has scarcely been noticed, having fallen beneath contempt. His present publication is noticeable only as a studied attempt to help the Republican party over a difficult piece of road. Even here its only significance arises from the suspicion that it was put forth at this juncture at the instigation or with the connivance of Gov. Hill himself, who was in Albany on Saturday. The *World's* Albany correspondent says: "Yesterday Senator Hill and Chairman Murphy of the State Committee held a conference here, and last night the order was given to release the report for Monday, August 29." We profess to have no knowledge on this delicate subject. We merely say that the report itself will be harmless; but if it is an indication of what Gov. Hill and his crowd are about, then it behooves the National Democratic Committee to take the campaign in this State into their own hands exclusively, and without the least delay.

The reason why Peck will not produce the harm to his own party which he evidently intended is that he has tremendously overdone his job. He has contradicted Senator Aldrich, the chief Republican wage statistician, to such a degree that if we were to take both of them as true, we should be driven to the conclusion that the McKinley tariff was devised to benefit New York at the expense of all the rest of the country. Mr. Aldrich showed, or attempted to show, that there had been an average increase of wages since the passage of the McKinley Bill of *three fourths of one per cent.* That was the extent of his claim, founded upon the investigations of the Senate Committee, which had taken

a vast deal of sworn testimony, the witnesses all being subjected to cross-examination. Senator Carlisle, in his reply to Aldrich, showed that the only increase of wages had taken place in the non-protected industries, while there had been a decrease in the protected industries. What Peck meant to say the percentage of increase of wages in this State had been during the same period, cannot be made out of his jumbled statement. We print it, however, in parallel columns with Aldrich's:

PECK'S REPORT.

"Of the sixty-eight industries included, 75 per cent. of them show an increased average yearly earning in the year 1891, while the total average increase of yearly earnings of the 285,000 employees was $23.11 each. The average increase of yearly earnings of the employees in fifty-one trades showing an increase was $43.96 each in 1891 as compared with 1890."

ALDRICH'S SPEECH IN SENATE, JULY 26.

The investigation by the Senate Finance Committee into wages from June, 1889, to September, 1891, showed an average increase for the occupations included in the inquiry of three-fourths of one per cent." — *Congressional Record, page 7,530.*

To complete the record, we add what Senator Carlisle said in reply to Mr. Aldrich:

"The Senator from Rhode Island stated generally, as will be seen from his printed speech, that the Committee had found that, while there had been a decline in prices, there had been an increase of seventy-five hundredths of one per cent. in wages, whereas I assert now, with the tables before me, that the only instance in which any increase of wages occurred, taking the whole together, was in these fifteen substantially unprotected industries; and I will show presently that in the fifteen highly protected industries in which the rate of wages had increased before the McKinley Bill passed, *there was a decrease after it passed.*"

Peck's jumble is evidently intended to have a resounding noise and to affect the imaginations of those who take the general purport of words without weighing them or examining their basis. It is worth recalling that Mr. Powderly, the head of the largest labor organization in the country, in a recently published article, differs radically from Peck as to the effect of the tariff on wages.

Let us now glance at the sources of Peck's information. He sends out a lot of blanks to the protected manufacturers, asking them certain questions about wages. Of course they all see the point and frame the answers to suit themselves. There is no cross-examination, indeed there is no examination in chief, but merely an exchange of letters by mail. The answers are not sworn to, and, even if they were, no prosecution for perjury could be had since the parties are not giving any evidence which the law requires from them. Moreover, Peck himself tells us that the evidence is altogether of a private nature, that it has been given in confidence, and that he cannot submit it to the test of verification or rebuttal. Here is his colloquy with the *Herald* correspondent:

"'Are the original letters on file in your office?' I asked.

"'They are, every one of them,' was the reply, 'but they cannot be thrown open to the public. They are in many cases confidential letters from business men who would only agree to furnish me statistics on the assurance that the private facts concerning their business should not be made public.'"

If Mr. Carroll D. Wright, or Prof. Richmond Smith, or Gen. Francis Walker, or any other statistician of recognized character and ability should publish a mass of statistics having a decided political cast, no other statistician would feel bound to accept them as conclusive without testing their accuracy; and if the means of testing it were denied, they would simply say that they must be judged wholly by our knowledge of the person collecting and preparing them. If we apply this reasoning to Peck, the whole mass goes to the garbage heap at once, along with his other reports, except that probably this one will go a little faster than the others on account of its political character. It was evidently put out at this time to damage Mr. Cleveland and to prevent a Democratic victory in the nation. If this had not been the object, it would have been withheld until after the election. Any merely scientific aim that had been evolved in the brain of Peck would have been as easily secured two months hence as now. But the political aim could only be accomplished now.

It might be pointed out that if Peck's statistics were to be taken as correct, instead of Aldrich's or Carlisle's, it would still be incumbent on him or on somebody to show the connection between the tariff and wages. If this task were successfully achieved, the fact would remain that an artificial increase of wages in some employments must be gained at the expense of other people in other employments. But it will be time enough to go into these branches of the inquiry when some evidence is advanced to sustain the statistics.

FARMING IN MAINE.

A RECENT census bulletin gives the results of the investigation into the ownership of the farms and homes of Maine and into the encumbrances upon them. This inquiry was entirely distinct from that into the recorded indebtedness of the country. Each of the family schedules furnished the enumerators contained the following questions:

"Is the home you live in hired, or is it owned by the head or by a member of the family? If owned by head or member of family, is the home free from mortgage encumbrance? If the head of the family is a farmer, is the farm which he cultivates hired, or is it owned by him or by a member of his family? If owned by head or member of family, is the farm free from mortgage encumbrance? If the home or farm is owned by head or member of family, and mortgaged, give the post-office address of owner."

From the answers to these questions, it is possible to determine how many families cultivated farms and how many did not, the number of families who owned the farms they cultivated or the houses they occupied, the number of those owning the farms they cultivated or the houses in which they lived free from encumbrance, and the number of those upon whose farms or houses there were mortgages. Whenever the answer showed that the farm or home was mortgaged, the Census Office has sought to obtain by direct correspondence with the head of each family the value of the farm or house, the amount of encumbrance upon it, the interest paid on such encumbrance, and the object for which the indebtedness was contracted.

Maine is the first complete State for which the results have been published, although in response to an inquiry of Senator Peffer of Kansas the Census Office some months ago compiled the returns from some ten Kansas and an equal number of Ohio counties. A farm in the meaning of the census returns includes, besides what are commonly known as farms, all considerable nurseries, orchards, and market gardens cultivated for pecuniary profit, and employing as much as the labor of one able-bodied workman during the year. Cabbage and potato-patches, family vegetable-gardens, and ornamental lawns, not constituting a portion of a farm for general agricultural purposes, are excluded. No tract of less than three acres was reported as a farm unless at least $500 worth of produce had been sold from it during the census year.

Out of the 150,355 families residing in Maine on June 1, 1890, 62,123 are returned as cultivating farms as above defined. It must be borne in mind that the families of hired farm laborers who do not own or rent farms are not included in the number of those cultivating farms, while many families some of whose resident members may have other than agricultural pursuits are included, so that the proportion which these families bear to the total number of families in the State is not necessarily the same borne by what are commonly termed the agricultural classes to the total population.

The returns show that in Maine more than 92 per cent. of the families who cultivate farms own them, and nearly 72 per cent. own them free of encumbrance. If the selected counties in Kansas and Ohio, the returns for which have been published, are fair samples of the rest of their respective States, the proportion of tenant farmers is less than one-fourth as great in Maine as it is in either of the other States, as 33 per cent. of the Kansas and 37 per cent. of the Ohio farmers rent their farms. In the proportion of mortgaged farms Maine, while very much better off than Kansas, in which 43 per cent. of the farmers have mortgages on their land, is not quite so well off as Ohio, in which State the places of but 13 per cent. of the farm-cultivating families are mortgaged.

In Maine the average value of the mortgaged farms occupied by their owners was, according to their owners' estimate, only $1,449, while the mortgages upon them averaged $532, or about 37 per cent. It is noticeable that in all three States the ratio

of encumbrance to gross value of encumbered property is substantially the same, varying in the different States less than 2 per cent. The average mortgaged farm in Kansas or Ohio, however, was worth, according to its owner's statement, more than twice as much as in Maine, the Ohio average being $3,848, and the Kansas $3,694. The mortgages were also proportionately larger, averaging $1,422 in the former State and $1,402 in the latter. The Maine farmer pays less for the money he borrows, the rate of interest on his mortgages averaging 6.26 per cent, including in the interest all bonuses and commissions he had to pay for the loan, while the average rate in Ohio is 6.85 per cent., and in Kansas as much as 8.12 per cent.

More than 64.79 per cent. of the mortgage debt of the Maine farmers was incurred for the purchase of real estate and for that alone, and 75.12 per cent. for the purchase and improvement of real estate. In Ohio the percentage of debt incurred for the objects named is 74.75, or almost precisely the same as in Maine. In Kansas, however, only 53.79 per cent. of the debt was incurred for the purchase and improvement of real estate uncombined with other objects. In all three States a much larger percentage of the farmers than of the other classes of the population own their homes. Thus in Maine only 48.02 per cent. of the families not occupying farms own their homes, as against 92 38 per cent. of those occupying farms; in Ohio the respective percentages are 30.36 and 62 90, and in Kansas 51 69 and 66.75. Home ownership is least common in the larger cities; thus, in Hamilton County, Ohio, which includes the city of Cincinnati, only 21.95 per cent. of the families live in their own houses, as against 50.24 per cent. in the other nine counties the returns for which have been compiled. In Maine, in the eight cities having 8,000 inhabitants each, 36.23 per cent. of the families own their homes, while in the rest of the State the percentage is 53 11. In Maine the mortgaged homes of families not cultivating farms have a higher average value than the mortgaged farms, while the contrary is true in Ohio and Kansas. In Maine and Ohio about the same proportion of homes and farms occupied by their owners are mortgaged, while in Kansas a much larger proportion of owned homes than of farms are free from encumbrance.

REFORM OF ENGLISH LEGAL PROCEDURE.

It is not without surprise that Americans read that the entire body of English judges have agreed upon a report which exposes numerous defects in the present system of administering justice, and recommends a scheme for its improvement. We have so long been accustomed to speak of British conservatism that it is hard to realize how much more rapid the rate of change has been in the mother country in recent years, not only in political institutions, but also in the substance and the practice of the law. In certain respects we were already so far in advance that we may still look back upon the progress of English reform, but in others it cannot be denied that we have been distanced. The very fact that no body of American judges reports upon the methods of administering justice, or effects any material change in these methods, is an indication of itself that our system is defective. Judges are especially qualified by their experience to suggest improvements in legal procedure, and under an enlightened system of jurisprudence this would be one of their regular functions. The English judges seem to be able not only to suggest changes, but to a considerable extent to initiate them without legislative assistance.

Most of the reforms proposed by the English judges are of purely technical interest, but there are a number of general importance, some of which deserve imitation in this country. Some twenty years since, the Judicature Acts were passed in England, under which changes were made similar in a general way to those effected more than forty years ago in the State of New York. The old distinctions between law and equity were to be abolished, the old forms of common-law pleading were to be done away with, and practice was to be so simplified as to enable every man to be his own lawyer. What the result has been in New York is well known and need not be dwelt upon. It is enough to say that the very evils that took place here in consequence of the adoption of our code have taken place in England in consequence of the Judicature Acts. The old forms of pleading had a quaint, not to say repulsive, aspect, but they had resulted, after centuries of use, in making pleading a science. What it has become under a system which encourages the pleader, as Mr. O'Conor said, "to tell his story just as one old woman would to another," every one knows who has had to answer a rambling, illogical, and unintelligible complaint according to its folly. So far as simplifying pleading goes, the criticism of an English judge is applicable to both countries :

> "The reformers of the Judicature Acts found no difficulty in charming the public with the idea that it would be an excellent improvement to substitute a less rigid and less formal method, under which a simple man—so ran the thought—might tell his own unvarnished tale without any of the artifice and verbiage of the lawyer. Experience, unfortunately, soon showed that the artists who draw the narratives of litigants are not often simple; and it may be added that their tales are frequently not unvarnished. The ancient severity of the common-law pleading was replaced by lengthy statements on behalf of plaintiff and of defendant, from which the points could only be extracted by painful and (generally speaking) useless industry. Expense was doubled and simplicity was not promoted."

But whatever claim is made in favor of the modern system, or lack of system, of pleading, no one can deny that the introduction of the Code in New York was followed by a prodigious increase in the number of steps in a litigation. Under the old system the rules of practice were known to the bar and the bench, but when the Code came, both had to learn their business over again, and take up their time with inquiries as to whether the practice prescribed in the Code was the same as before or different. However it be explained, we have the fact to deal with that there has been an enormous multiplication of interlocutory applications and appeals in this State, and that is precisely what has taken place in England since the Judicature Acts. By rendering the machinery of Chancery applicable to actions at law, these acts made available to litigants generally such weapons as interrogatories and bills of discovery, to the great increase of trouble, delay, and expense. On the Chancery side there has been some improvement, but the last state of the common-law litigant is worse than the first.

These evils are dealt with in a drastic manner by the judges. It is proposed that within a fortnight of the beginning of an action a "summons for directions" shall be taken out, under which the parties shall appear before a master, who will investigate the cause of action. He is to be empowered to settle the preliminaries of the trial, to direct as to its mode and place, to put a cause into a special list for immediate trial, to allow and disallow pleadings, to prescribe the kinds of evidence for particular points and the manner in which it shall be obtained and presented, and in general to give such directions as to procedure as will prevent delay. It is believed that in this way the evil of incessant summonses, which correspond with our notices of motion, will be checked. The end is desirable enough, for at present the order of the master is taken on appeal to the judge, and from him appeal lies to the Divisional Court, thence to the Court of Appeal, and finally even to the House of Lords. The manner of dealing with this question of appeals we need not enter into further than to say that the time for interlocutory appeals is shortened to eight or fourteen instead of twenty-one days, and appeals from final judgments must be taken within two months instead of a year. This reform might well be imitated in this country.

Other improvements proposed by the judges are: special calendars for commercial cases and special judges for work of this kind, changes in the method of administering estates, and other matters to which we cannot refer. Two subjects, however, are of so much importance as to deserve notice. At present, civil causes are tried at fifty-six circuit towns twice a year. But during the last four years there have been no causes for trial at one of these towns, only one case a year at a number, and at forty of them the number of cases is insignificant. By reducing the number of assize towns to eighteen, such an economy in the time of the judges will be effected as will enable

at least eight judges to be always present in London.

A more interesting reform, which is not without its lessons for us, is the proposed formation of a court of appeal in criminal cases. At present the Home Secretary practically acts as such a court, but appeals are pressed upon him by all sorts of influences, and his position is an odious one. The proposed court is to be empowered to increase or to diminish punishment. Apparently the court is to be competent to quash convictions, but no new trial is to be granted. While the administration of the English criminal law differs so radically from our own as to make any analogy imperfect, there seems to be no reason why we should not follow suit in instituting a court of criminal appeal. We have never been able to understand why, with all the complaint of the excessive burdens thrown upon our Court of Appeals, there has never been any movement to relieve it of the review of criminal trials. It would be a perfectly simple and satisfactory arrangement to constitute a court out of a certain number of Supreme Court justices which should meet whenever there were appeals to be heard. In this way a very considerable relief would be afforded to the Court of Appeals, while the public would gain by the prompt application of justice in criminal cases. The present delay between sentence and execution in murder cases does much to diminish the exemplary effect of the death penalty.

THE QUESTION OF THE COLONIES.

PARIS, August 17, 1892.

THE question of the colonies is the order of the day. The events in Dahomey take up considerable space in the daily newspapers. Before its adjournment three weeks ago, the Chamber discussed two interpellations in reference to the colonies, one of which resulted in the fall of the Minister of the Marine, M. Cavaignac. This retirement, as, indeed, the discussion that took place upon the interpellations, is in certain respects very significant.

The work of the Third Republic, so far as concerns the colonies, has been in some points of view of considerable importance. Algeria and Cochin-China have been respectively enlarged by the addition of Tunis and Tonkin; and when, during these last few years, the various European Powers set about parcelling out to themselves the African Continent, France assured herself a considerable share, inasmuch as she placed Madagascar under her protectorate, and extended greatly the limits of the territories she had already acquired there, to wit, Senegal and Gaboon and sundry factories on the coast of Guinea. The Government of the Republic found itself in many respects in a favorable position to extend its possessions beyond the seas. The colonial enterprises of a country are always in a very large measure subordinate to its relations with other Powers. The desire of intervening in European questions naturally prevents the employment of large forces in far-off regions; and the necessity of conciliating the susceptibilities of allies who are also colonizing Powers may exercise a certain influence in preventing the annexation of one or another territory. Thus, for instance, the whole history of French colonization during the present century is subordinated to the state of its relations at any given date with its sister Power, England. That country, jealous of any rival to its maritime and commercial supremacy, looks with unfavorable eye upon the different posts established beyond the seas by any other nation than itself. The Government of the Restoration undertook to add new colonies to those that the treaties of 1814 had left to it. It directed important enterprises in Madagascar and set itself the task of conquering Algeria. The Revolution of 1830 came to put a sudden stop to its attempts. As a matter of fact, the Government of Louis Philippe, from the very beginning of that king's reign, saw itself obliged to rely for support on Great Britain. While on the one hand the Restoration, entering into friendly relations with Russia, had been able to disregard English protests, on the other hand Louis Philippe was obliged to take account of them. Madagascar ceased completely to occupy the Ministerial mind, and for many years the question could be reasonably asked, "Is Algeria going to be evacuated?"

During the period of understanding with England which lasted all through the reign of Louis Philippe and through a part of the reign of Napoleon III., the French Government was able to create a few colonial establishments. This was due to causes of a special nature. For example, when treaties had been signed, at the instigation of England, by which France undertook to help in the repression of the slave trade, and consequently to maintain cruisers on the coasts of Africa, it was necessary for the ships to have certain calling-stations assured to them, and, to this end, to occupy a number of strategic positions. In this way the establishments at Gaboon were created, and the various factories on the Guinea Coast (1835-1845). Reasons of another order brought about the conquest of Cochin-China in 1862.

After the disastrous war of 1870, France, renouncing for the time being all interference in European affairs, was on that account the more easily able to direct a part of her activity towards her possessions beyond the seas. Her work here was also the more facilitated inasmuch as circumstances peculiar to the time allowed her to occupy fresh territory without thereby provoking any conflict with other Continental Powers. Not that England was disposed to regard such attempts with any more favorable eye; but besides that France had no longer any special reason to conciliate the susceptibilities of England—as was the case in the time of Louis Philippe and of Napoleon III.—she was no longer to struggle alone against the ill-will of her neighbor. Germany first, and afterwards Italy, desired also to have colonies of their own; and England, having opposed to her not simply France, but also a number of Powers which in these matters were often united by community of interest, showed herself very much more accommodating than in the past.

The achievement of the work that the French Government had planned out was yet further helped by the excellent materials which it had at its disposal. Explorers such as M. de Brazza, Capt. Binger, Lieut. Mizon—the last of whom returned to France only a short time ago—succeeded, in spite of the small and oftentimes utterly inadequate resources they possessed, in holding their own against the powerful colonizing companies belonging to England and the Congo State. They succeeded, almost without escort and almost without striking a blow, in opening up roads of communication and in establishing French influence over large tracts of territory. So far as this kind of work is concerned, we have managed to do as well as any other nation.

The success, however, is by no means so brilliant wherever it has been necessary to organize the possessions we have gained, or when an armed struggle has had to be undertaken against the natives. French administration, costly and complicated in its working does not know how to adapt itself to circumstances, and would fain introduce its habits of routine into colonial government. In particular, the civil and the military element do not get on well together. Dissensions break out between the Minister for War and the Minister of the Marine. The coöperation of these two departments is a prime necessity to the carrying out of even the smallest operation, and yet each administration often keeps exclusive direction of the men under its orders. Each Minister, fearing more than aught else to compromise his responsibility, gives the minutest instructions to his subordinates, and as the result we see captains in the navy obliged to refuse help to their brother officers in the army, even when this help is urgently demanded. It must, however, be recognized that if such things happen—which all must regret—the fault is not to be exclusively attributed to the executive power. For a long time the Government had to contend, almost unceasingly, against a very violent Parliamentary opposition. Monarchists and Radicals, ever seeking opportunities to overthrow the successive cabinets, used to reproach the Government with weakening France by scattering her effective forces all over the globe; and whenever a difficulty arose, or a demand for money was made, the necessity of evacuating the new colonies without delay was preached with never-varying refrain.

If this systematic and relentless opposition was never strong enough to cause the Government to make a complete change in its policy, it nevertheless contributed a great deal to paralyze it and to prevent it from acting with the energy it ought. Harassed without ceasing, never knowing what the morrow might bring forth, and never definitely assured of the support of Parliament, the Government tried often to carry out a colonial policy while seeming to be doing nothing. Instead of preparing with care the necessary means of action, and of quietly pursuing the realization of a largely conceived plan, it nearly always sought to dissimulate the importance of the enterprise that it meditated, as also of the obstacles that it would have to overcome. The credits first asked for were always insufficient to assure an energetic action, and from the fact of these enterprises not being conceived as they ought, the resources actually furnished, inadequate in themselves, were often squandered by reason of the bad management referred to above.

It would, however, seem that the respective positions of the Government and Parliament in reference to colonial matters have at least undergone a certain modification, and the recent Parliamentary incidents of which I spoke at the beginning indicate that the Chamber is now showing on such questions a more just appreciation of events. A foraging company having fallen into an ambush in Tonkin, an interpellation was made in the Chamber, and the discussion that followed revealed the deputies in a new light—viz., as frankly realizing that such incidents are inevitable in a newly conquered country, for nobody spoke of evacuation. Still more, it would appear now

that Parliament sees into colonial policy more clearly even than the Government itself, and, far from hampering its efforts, points out to it the course to pursue. In the campaign that is about to be opened against the King of Dahomey, the Minister of the Marine, M. Cavaignac, wished to maintain the deplorable traditions of the past and keep the command of the sea forces absolutely independent of that of the land forces. Rendered wise by experience, the Chamber invited the Government to unite in one authority the command of all the expeditionary forces. The vote embodying this desire caused the resignation of the Minister in question, but it is impossible not to recognize that this time it is the Chamber which was right.

Another proposition, also voted in the last days of the session, is still more significant. Bearing the signatures of MM. le Baron Reille, Lockroy, and Reinach—that is to say, of a Conservative, a Radical, and a Moderate Republican—it seemed to make plain that the Opposition is disarming on matters distinctively colonial, and that soon these questions, like those of national defence, will be placed above the quarrels of party. As for the tenor of the proposition, it simply invited the Government to push on with the formation of the colonial army. Yet such a vote as this is already a great progress. Indeed, to leave aside technical considerations into which it would be too long to enter here, the formation of a colonial army, the principle of which was voted so long ago as last year—that is to say, the creation of regiments made up of special elements and charged exclusively with the defence of the various colonies, instead of the troops sent at the present time from France—would isolate the colonies more from the metropolis, at least in certain respects, and would thus be a first step in the direction of a real colonial organization. Moreover, it would show that France has a firm intention of entering more and more upon a steady policy of colonization, and this is why it is interesting to remark that it is now the Chamber itself that is urging the Government to form this army.

S.

AN EXTRA-TERRITORIAL ITALIAN CITY.

TRIESTE, August 1, 1892.

WE left Venice as the splendid marine band, playing in the Piazza San Marco under the windows of the popular Rear-Admiral, Prince Thomas of Savoy, struck up a warlike march. Sheet lightning illuminated the Piazzetta, extinguishing at intervals the electric lights there and on the deck of the Lloyd steamer *Maximilian*, on which we had taken tickets for the yonder shore of the Adriatic Sea.

Venice may celebrate her silver wedding, for just five-and-twenty years ago she gave herself a glad, enthusiastic bride to one Italy, as yet uncrowned in Rome. A quarter of a century has passed, yet the memory of those days is still fresh. To the Venetians it seemed as though the Austrians would never take themselves off. "I vai? I vai?" (Are they going? are they going?) was the eager interrogation every morning until the glad day when the last white uniform vanished and the population, with one great sigh of relief, shouted, "I ze andai!" (They are gone). For the rest of Italy, though gladdened by the liberation of Venice, the outlook was gloomy. The catastrophe of Custozza, the shame of Lissa, saddened the hearts of all. The "useless Alps," as Carlo Cattaneo called them, were and (alas) still are in the hands of the foreigner—France encamped on the heights of Mont Cenis; Austria, a stone's throw from Verona, Bassano, and Udine. That the Tyrol will gravitate to the mother country sooner or later no one doubts, but it must be in virtue of some extraordinary pressure that Austria will cede Trieste, her one great port on the Adriatic, the port till yesterday the most flourishing of all the ports on the Adriatic or Mediterranean shores.

Reared and fostered by Austria at the expense of Venice, which never for an hour or an instant concealed its hatred and contempt for Austrian rule, Trieste in 1848-'9 gave no sign of her relationship to the rest of Italy. On the contrary, when, the war between the Milanese, the Venetians, and their ally, Carlo Alberto, against the Austrians being at its height, the Sardinian fleet, commanded by Admiral Albini, with the Neapolitan and Venetian squadrons, entered the Adriatic, forced the Austrian fleet to take refuge at Pola, and on the 23d of May arrived in the Gulf of Trieste, the soldiers of the garrison, the civic guard, and the militia took up position along the shore ready to repulse "the invaders" if they should attempt a landing. The cannon on the forts were ready, the treasure was carried into the castle. The consuls of the various nations protested that Trieste was a commercial city in which all nations were interested; that any offence against Trieste would be considered an offence against all nations represented by the resident consuls. Two days passed, then the ships weighed anchor and left the Adriatic, the Admiral being recalled by a despatch from Turin, as Germany had protested against "the eventual occupation of Trieste." The Emperor Ferdinand, when the catastrophe of Novara decided the fate of Lombardy, and when famine and cholera, more than the incessant bombardment, had compelled Venice to hoist the white flag, handed over these rebellious provinces to the tender mercies of Radetzky; but "Trieste the loyal," "Trieste the faithful," was rewarded with a lavish hand. In 1849 a special and separate constitution was granted to Trieste, which *statuto* the Triestines still look upon as their greatest treasure. "To the city of Trieste, city of the Empire, is guaranteed her absolute autonomy within the limits fixed by the Constitution of the Empire. The colors and the coat of arms of the city of Trieste are reserved intact." To this city of the Empire "is guaranteed the right of sending two deputies to the first chamber of Parliament. The elections of the representatives of the city of Trieste in the second chamber will be regulated by the law of the Empire." The number of the municipal councillors was increased from forty to fifty-six, the city detached from the Litorale and constituted into a separate province with the territory which extends from Rosanda in the valley of Zaule to the village of Santa Croce in Carsia. But all these new and important privileges were nothing in comparison with *the* privilege of *porto franco* granted by Charles VI., by which the city was exempted from custom-house dues outside the walls; ships laden with merchandise could enter and quit the port, transfer their freight from one to the other, deposit their imports and exports in the warehouses on the Quay of San Carlo or in private stores, without paying duty or tax. And this privilege was maintained until 1888, when, some say to second the doctrines of the Austrian economists, others to punish the city for its late liberal manifestations, it was abolished, and grievous are the lamentations of the citizens.

Not that it would be just to attribute to this material fact the deep and ever-widening increase of Italian feeling among the Triestines. The sentiment of their Italian origin, the prompt reply to the "What is the city's fatherland?" has always existed more or less; but until Rome was freed from the French and the temporal power of the Pope abolished, the unity of Italy was not credited, and the annexation of Trieste to the "kingdom of upper Italy" was never regarded as a desideratum. But since 1870 the feelings of the Triestines towards Italy and of the Italians towards Trieste have become more intense and of more daring manifestation. True, "unredeemed Italy" has been the watchword for factious demagogues who seek only to embarrass every government, and who have no intention to risk their necks in attempting the redemption; but here, as there, a strong and deepening conviction has spread that without Trieste and Trent, without the Alps and the Adriatic, Italy will never be strong or safe from invaders. This conviction it is which has brought many thorough haters of Austria to tolerate and even favor the Triple Alliance, believing that, in the case of any war with foreign Powers, Italy's assistance or even her neutrality will lead to the peaceful cession of "one at a time" or even of both of the provinces.

These speculations were rife among the many voyagers from Venice to Trieste, between which cities constant intercourse is maintained. On board there were a number of *mandolisti*, young Venetians of good families who have formed a club, and who, with their mandolins, were going to give a gratuitous concert at the bathing station of Bagnolo. A heavy storm, accompanied by thunder and lightning, stopped their performances on deck, but below they made night weary with their scrapings and squeakings, which just now are all the fashion, so that it was a relief when dawn broke and we were able to distinguish in the distance the Gulf of Trieste on the eastern shore of the extreme Adriatic, with the mountains of Catinara and Opcina (the mountains of the Vena, as they are called), to the left, and the Julian Alps towering behind at some distance, while hamlets and villages strew the shore to the right and left of the city. The horns of the Gulf extend, as though offering a welcome, from the station and St. Andrea. The city has an imposing aspect, and, with its villas nested among the verdant slopes and its rugged mounts, bare, stony and barren, reminds you of Genoa; and of Genoa it has all the life and activity—the joyous sounds of hammer and anvil, the flags of all nations, and the business aspect at every turn, so wanting in faint and feckless Venice. The Lloyd steamers lie at the Quay of San Carlo, so there is no need for boats or gondolas; the porters are decent and evidently in well-kept order; you deposit your few traps at the nearest hotel, and away in a tram for "anywhere it goes to."

The first "anywhere" was Barcola, now a flourishing bathing station, bright, gay, and clean as a Dutchman's house. Everywhere the cleanliness of the streets, the public buildings, and especially of the charitable institutions, strikes one. At Barcola, an old Roman colony, the explorations for Roman remains have been carried on successfully. In the civic museum of antiquities an entire room is paved and walled with splendid and perfect mosaics. The remains of a vast thermal edifice with the plan intact have been discovered, and the municipality votes annually the necessary sums for the continuation of the works.

The Triestines, in familiar conversation, use

the dialect, and the *zezete* of the soft Venetian tongue prevails; but the language written and taught in the schools is pure Italian, and the burning question is the maintenance of the Italian language, for which Austria has vainly attempted to substitute the German. But the commune builds its own school-houses and pays for the education of the poor; on its shoulders fall all the expenses for higher education, and the number of educational establishments is remarkable. Until the grant of the *porto franco*, the German language was unknown. When the Emperor Frederic III. wrote for the first time to the city in German, a translator had to be found, and the Government opened an office, *Translatador delle lettere tedesche*. In 1524 the Council sent commissaries to Ferdinand I. to implore that the judges who adjusted the questions between Carniola and Trieste should use the Latin language, saying, "The mother tongue of the Triestines is Italian. No one born in Trieste understands the German language." After the introduction of the free port, and especially towards the close of the last century, the number of Germans, the employees and the military—German all—did their utmost to change the language, and Joseph II. decreed in 1786 that within three years the use of the Italian language in Government offices should be abolished. Next it was to be introduced into the schools, so that the people from their infancy should be familiarized with the German tongue. But all these efforts failed; the "old city" held its own. In the tribunals, in the Chamber of Commerce, in the municipality, Italian only is spoken. German, French, English, and Greek are taught, but the attempt to substitute German has failed utterly, and in 1868 the Emperor decreed that "all the nations forming the Empire have equal rights, and that every single nation possesses the inviolable right to preserve and to cultivate its own nationality and its proper idiom."

This right, however, has to be paid for. The municipality alone spends 600,000 florins (about $300,000) for public instruction, half of this for the popular elementary schools. There are infant schools in every district, and these are really child-gardens, all the children receiving a good meal a day. The gymnasia, lyceums, and superior schools are excellent. The female lyceum has eight classes and is thronged with students. The libraries, museums, and other institutions are many and good, and the sum spent by the municipality does not represent the actual outlay. The gymnasia and realschulen are subsidized by the State; their chief purpose being to prepare students for the universities and technical high schools. It is a standing grievance that Trieste has no university, while in Austria-Hungary there are eleven. Before the annexation of Venetian Lombardy to Italy, the Triestines frequented the universities of Padua and Bologna; now, in order to obtain diplomas for the exercise of their respective professions, they are virtually compelled to attend one of the Austrian universities. Neither does Trieste possess a technical high school, of which there are seven in Austria for various branches of engineering and technical chemistry. Many schools in Trieste are endowed or subsidized by private contribution. The Jews and Slovenes maintain schools of their own. The latter is the troublesome element, detesting the Italian supremacy, and the priests from their pulpits enjoin on the parents to abstain from sending their children to the schools. In Austria, though there is no poor-law entitling all to shelter, food, and clothing, the right to poor relief is defined by an imperial statute; but the regulations for the apportionment of the cost are varied, and made by the separate provinces. In Trieste the charitable institutions are many and well regulated. The municipality spends now some 700,000, as the abolition of the free port has thrown hundreds of families out of employment. The civic hospital is a magnificent building, containing 2,000 beds; the wards are bright and airy, and the wooden floors are white and clean as the deck of a man-of-war. A maternity ward has been opened lately, and the women are received without question and assisted on leaving to suckle and maintain their babes. There is no real foundling hospital, but waifs and strays are put out to nurse when found destitute. Infanticide, nevertheless, is a crime almost unknown; the "unfortunate" mothers in need being assisted at home.

There is a general direction of public beneficence, and its arrangements are worthy of study and imitation. Starting with the "poor fund," augmented by private subscriptions and the grant by the Government of 5 per cent. on the wine duty, the General Institute for the Poor was set on foot, and in 1862 the Pia Casa for the poor was erected, capable of housing 800 individuals. Old men and women unable to work are received, fed and clothed; orphans and poor children are also admitted, instructed and taught a trade, and kept, the boys until sixteen, when they always find employment, and the girls until a situation is provided. Here again the perfect cleanliness delighted one, the peaceful harmony prevailing, the smile of welcome that greeted the kindly and devoted Inspector wherever he passed, so different from the cowed aspect of the inmates of charitable institutions in Naples, where the funds belonging to the poor are squandered by the "administrators" (governors employed for electioneering) and sundries. Some 50,000 florins are distributed annually as out-door relief, and now the soup-kitchen is, alas, crowded with men and women and children who a year or two ago were industrious members of the community. The kitchens of both hospitals and this poorhouse are splendid; the food exquisitely cooked and abundant, especially for the aged and infirm. To these is given wine three times a week; to the able-bodied who work, once a week. As the wine of the Istrian district is dear and scarce, while beer is cheap and abundant, I asked why the latter beverage was not substituted for the healthy inmates. "Beer is a *tedescheria* [Germanism]," said the administrator quite naturally. One branch of the house is set aside for the poor Jews with separate kitchen, and this is just, as the Israelites contribute largely to the maintenance of public charities, and the Baron Elio Morpurg figures at the head of most public subscriptions. In a ward the beggars are kept apart until the managers can ascertain whether they are really indigent or ne'er-do-weels.

In a separate building and with a quite distinct management is the reformatory or workhouse for boys found on the streets or declared by the parents to be incorrigible. Here the fare is Spartan and the sleeping arrangements are certainly not luxurious. The lads are all drilled and have a fine band; they receive an elementary education and are taught trades, and in both the houses the work of the youths is remunerative to the institution and to themselves. So open and honest is, and I am assured ever has been, the administration that not a sou is squandered. Out of 800 waifs and strays taken in at six and kept till fifteen years of age, 80 per cent. may be called "redeemed"; 106 left the establishment last year. Of these, thirty are skilled workmen earning good salaries; thirty-six manage to earn their living; three have been sent to the Pia Casa; only eight are seemingly gone to the bad.

Every public department depends on the municipality. The Magnifico Podestà is the real and venerated representative of the city. The communal electoral right is possessed by every inhabitant over twenty years of age who has paid taxes for two years. The Podestà is also head of the diet which represents the Government of the territory. He must be elected by at least two-thirds of the members present, and these must in Trieste be twenty-eight. The election must be confirmed by the Emperor, and the confirmation communicated to the Council in public by the counsellor of the Lieutenancy. The present Magnifico Podestà, Dr. Ferdinand Pittari, elected by 51 out of 52 counsellors present, and at once confirmed in office, belongs to a well-known and much esteemed family of Liberals, and his son Richard is one of the literati of the city. The speeches that accompanied the inaugural ceremony were noteworthy for the pervading leaven of Italian sentiment. The "Magnifico," on his elevation to the highest civic dignity, was congratulated on being a "Triestine by birth and at heart," independent, liberal, *and Italian*; and in returning thanks, after dwelling on the disastrous conditions of Trieste at the present moment—a well-directed sentence to the pressmen, whom he exhorted "to keep in mind their high mission, to exert their widespread influence for the benefit of the well-beloved Trieste, to avoid party struggles and civic strife" —he promised the citizens present to "promote to the uttermost the instruction and the education of our people in the language of our forefathers, the mother-tongue that is yours and mine," which pledge was received with "rapturous applause." Soon after his election, a rumor spread that, in a tour of inspection, the Magnifico had addressed the populations in an alien tongue. He took the earliest opportunity to "refute the fable," saying, "In my tour of inspection throughout our territory, I spoke to all and everywhere in Italian, nor could I have done otherwise or spoken in an 'unknown tongue.' Although my principles in the question of nationality are deeply rooted in my heart, and their sincerity has been proved by my whole past, I gladly embrace this opportunity to affirm that the integrity of my sentiments, of my love for our mother tongue and for our national culture, increases with increasing years, and that I hold it my highest duty to promote the advance of both."

Such public expressions of sentiments by public functionaries in Trieste itself are proofs beyond all doubt of the Italianism of the citizens. During my too brief sojourn in the beautiful city, Dr. Attilio Hortis, the noted writer, most popular citizen, and the director of the civic library, was our courteous and intelligent cicerone. Politics were naturally eschewed between us. Since the suppression of the Pro Patria society by the Government, the National League has taken its place, and its members are numerous and patriotic. Certain it is that *if*, whensoever and howsoever, Trieste gravitate to Italy, the noble city and territory will bring a vast and valuable contribution of civic virtue, of talent, industry, and self-government, in the Anglo-Saxon sense of the term, to the mother country, which will welcome it with open arms. J. W. M.

BARDOUX'S LAFAYETTE.—II.

PARIS, August 16, 1892.

ON the 21st of October, 1778, Congress gave Gen. Lafayette leave to go to France and to fix for himself the date of his return. The *Alliance*, the best ship in the navy, was chosen to convey him to Europe. Lafayette had a long journey to make on horseback, to go to Boston, where he was to embark; he fell ill on the way, but he succeeded in reaching Boston, and put to sea on January 11, 1779. He arrived at Brest on the 20th of February.

He had left France as a rebel; he returned to it triumphantly. He had to undergo *pro forma* a week's arrest for his desertion; he was allowed to spend the time at the Hôtel de Noailles. All the ladies of the court wished to kiss him. Marie-Antoinette gave him a regiment. The French Government gave the command of the corps which was sent to America to Rochambeau. Lafayette was only twenty-two years old; Rochambeau had served brilliantly in the Seven Years' War. Lafayette remained in the service of the United States and became a sort of negotiator between the French and the American forces. He embarked on the *Hermione* on February 11, 1780. Two months before, Madame de Lafayette had presented him with a son, who was named George after Washington, his godfather. A French squadron, with 5,000 men, reached Rhode Island on July 17, after seventy days of navigation. The French fortified themselves, and Lafayette informed Rochambeau of the project which Washington had formed against New York. "The officers and soldiers of the American Army," wrote Lafayette to M. de Vergennes on July 23, "have not a shilling. The former receive only a ration, and get no clothes, nor have they, as the soldiers have, the hope of receiving clothes from France." M. Bardoux gives us an interesting correspondence between Lafayette, who was ardent for immediate action, and Rochambeau, who stuck to Rhode Island. "It is always old Father Rochambeau who speaks to his dear son Lafayette, whom he loves and will always love and esteem to the end of his life."

When Gen. Phillips, by the order of Clinton, left New York to join the traitor Arnold, who had landed in Virginia with English troops, Lafayette was sent by Washington to Virginia with a force which numbered hardly 2,000 men. They had neither shoes nor shirts. The merchants of Baltimore lent Lafayette 2,000 guineas to buy cloth. The women whom he saw at a ball given in his honor undertook to make up the shirts. The young men of Baltimore formed a squadron of light cavalry. Lafayette marched with great rapidity towards Richmond and arrived before Phillips. After the death of this officer, Lord Cornwallis came to make a junction with Arnold. Speaking of Lafayette, he wrote: "The boy cannot escape me." The boy escaped him, nevertheless, and was always on his flank or his rear. Writing to his wife, Lafayette says: "It was not reasonable to confide to me such a command; if I had been unlucky, the public would have treated this partiality as blindness. . . . However, the campaign has taken a better turn than we could have hoped." The end, in fact, was near. Cornwallis's plan is now well known, as well as Washington's. A new French force was expected; Admiral de Grasse arrived with 3,200 men, and the memorable siege of Yorktown began. Cornwallis had to capitulate on the 19th of October, 1781. "The play is over," wrote Lafayette on the 20th to the Comte de Maurepas, "and the fifth act is ended."

Lafayette arrived in Paris unexpectedly on the 21st of January, 1782. M. de Ségur, the new Minister of War, announced to him that the King had appointed him "Maréchal de Camp" of his armies. The return of Lafayette created a real enthusiasm. Verses were made for him on the stage; he figured in "L'Amour Français," a play of Rochon de Chabannes. M. Bardoux forgets nothing. What do you think of this? "The eighteenth century always claimed its rights, and this model husband none the less inspired a very tender passion, which in time changed into faithful friendship, in the most charming person at court, and the handsomest, said her contemporaries—Madame de Simiane." Then comes a long eulogy of this lady; the climax is in these words: "To be beloved by Madame de Simiane seemed in the eyes of the old Duc de Laval to be as difficult a conquest as that of the principles of 1789." Really we could not have expected to see the principles of '89 in this affair. To be sure, M. Bardoux ends this little episode by saying the worldly successes of M. de Lafayette "were never of the same value to him as the pleasures of home."

Lafayette had become a representative man. "Surely it was much in the eyes of the nation to have beaten the English, on land and sea, for the first time since Louis XIV., and to have thus avenged a century of humiliation. But there was another sentiment in the popular favor: public opinion felt instinctively that Lafayette had fought for a noble and just cause, the liberty of a people. It was the Revolution that came back from America, and the General represented at the same time the triumphs of the present and the hopes of the future." Lafayette's letter to Washington (February 5, 1783) after the signing of the preliminaries of peace, is well known and has justly been admired; it is that in which for the first time he touches the question of slavery. "Now that you are going to have peace, allow me to propose to you a plan which might become very useful to the negro portion of the human race. Let us join and buy a small estate where we can try to give liberty to the negroes." Lafayette was always in quest of some great and noble purpose. He embarked in June, 1784, on his third journey to America, and was received triumphantly wherever he went. Washington met him at Richmond and took him to Mt. Vernon. He had a formal reception in the Congress; his name was given to various towns; he became a citizen of the United States. His first act on his return to France was a campaign for the Protestants, who had no civil status at the end of the eighteenth century. Their marriages were not legitimate, their wills had no legal force, their children were bastards. It is certainly curious to see that at first Lafayette found no echo. "Nobody," he writes to Washington, "is willing to give me a written line or to help me in any way."

In these years which preceded the French Revolution, Lafayette received many Englishmen and Americans. He had for his *coureur* an American Indian in his original costume, who called him father. He received Marmontel, the Abbé Morellet, the writers and the philosophers. He lived with great simplicity. When the state of the finances determined the convocation of 144 Notables, he was chosen one, and he played an important part in the meetings of this pseudo-parliament. He examined boldly all the reforms which could be made, and stood by the principle that retrenchment was to precede the creation of new taxes. Calonne proposed to the King to shut him up in the Bastille, but Louis XVI. was sincerely inclined to the policy of reform and of retrenchment. Lafayette was the first to pronounce in the Assembly of the Notables the word "States-General." The effect was extraordinary. "What," said the Comte d'Artois, "you ask for the convocation of the States-General?" "Yes, Sir, and even something better." The "something better" was a national and representative assembly.

Lafayette obtained civil equality for the Protestants, and it is only just to say that his chief supporter was the Bishop of Langres. "He has," said the latter, "spoken as a philosopher. I speak as a bishop, and I will say that I prefer the temple to the *prêche* and ministers to *prédicants*." Lafayette was elected deputy of the order of nobility for the *sénéchaussée* of Riom in the States-General at the very moment when Washington had accepted the Presidency of the United States. His career in the difficult years of the Revolution is well known. He had illusions, but not too many. He knew that the Tarpeian rock was near the Capitol. On the very day when he arrived in Paris at the Hôtel de Noailles, for the assembling of the States-General, he told this story to his family: He had made in 1785 a visit to the great Frederick at Potsdam, and in their conversation he had maintained that America would never have either noblemen or kings. "'Sir,' said a moment afterwards the old King, fixing on me his penetrating eye, 'I have known a young man who, after having visited countries where liberty and equality reigned, took it into his head to establish all that in his own country. Do you know what happened to him?' 'No, Sire.' 'Sir,' continued the King with a smile, 'he was hanged.'" Lafayette would not have been hanged, he would certainly have been guillotined if he had not fled the army at the moment when he had become the *bête noire* of the Jacobins.

It will ever be a sad and painful thing to go over those agitated years which followed the convocation of the States-General, and which ended in the establishment of a bloody and organized Terror. Events follow each other in quick succession, but their direction is always the same. The Constitutional party, the party that thought of establishing in France a government similar to that of England, has soon to give way to the Republican party; the deputies of France become the mere tools of the clubs of the capital; the clubs themselves devour each other—after the Girondins, the Jacobins.

When we read this second half of the work of M. Bardoux, we are struck by the great hatred which Queen Marie-Antoinette felt for Lafayette. At a time when there was a question of choosing between him and Pétion for Mayor of Paris, she preferred Pétion; she thought he could manage the popular party better than Lafayette. Lafayette was a gentleman, a nobleman, and the Queen resented what she considered as his defection more keenly than she did the folly of a Pétion. It is unbecoming and cruel to say a word against the unfortunate Marie-Antoinette; but the historian may deplore that she would never place confidence in a man like Lafayette, who was not a real enemy of monarchy, and who, at any rate, could always be trusted and was incapable of treason. Lafayette, as commander of the National Guard of France, became the real gaoler of the King and Queen. Such are the terrible fatalities of history. His turn came soon afterwards; he, also, had his "flight to Varennes," but he was luckier than the

King and the Queen: his life was spared, but he knew the bitterness of exile and the languor of captivity in an Austrian prison.

Correspondence.

RAPHAEL'S HOURS AND GALATEA.

To the Editor of The Nation:

Sir: Your correspondent calls attention to the resemblance between the "Third Hour of the Day" in Raphael's "Hours" and the "Galatea" in the Farnesina fresco. This resemblance, which is so close as to make it impossible to doubt that one figure was copied from the other, was long ago pointed out by Passavant in his book upon Raphael ('Rafael von Urbino und sein Vater Giovanni Santi'). Oddly enough, in the original (the German) edition of his book Passavant, by a species of heterophemy, ascribes the origin of these figures of the Hours to the enthusiasm excited by the discoveries in Pompeii. I am writing away from my books, but I believe that in the French translation of the 'Rafael' "the Baths of Titus" is substituted for "Pompeii."

The action of the arms and hands is precisely the same in the "Galatea" and in the "Third Hour," but Galatea holds in both hands the reins with which she guides the dolphins attached to her sea-shell chariot, while in the Hour a censer with burning incense is substituted for the dolphins, and the chains it swings by take the place of the reins. Another point to notice in the Galatea fresco is, that the Cupid lying on the dolphin in the foreground is as nearly like as possible to the infant Christ in the Bridgewater Madonna. Of these two figures also, it may be said, it is impossible to doubt that one was copied from the other. Which of the two figures thus repeated, the Galatea and the Cupid, was the original? Were they first used in the Farnesina fresco, or were they employed in that picture after they had done service elsewhere—the one in the Vatican, the other in the Bridgewater Madonna? The figure of the "Hour" is so well balanced in design and so logical in composition that it looks made expressly for the place it fills. The "Galatea," when compared with it, has rather the air of an adaptation. The Cupid, on the other hand, seems at home on his dolphin in the "Galatea," while as a sprawling lusty infant in the Madonna picture he has certainly an incongruous look. C. C.

Fishkill-on-Hudson, August 22, 1892.

THE PROCESS OF AN ERROR.

To the Editor of The Nation:

Sir: I wish to make a few observations on a point which your review of Mr. Samuel Ramsey's *English Language and English Grammar*, in No. 1410, leaves untouched.

With regard to "the expressions of which 'the house *was being built*' is a type," Mr. Ramsey writes:

"According to Mr. Kington Oliphant, this form of expression came into common use about 1770, although he cites two examples more than 300 years older. How many examples escaped notice we cannot say; but so much is clear, that the expression has been in the language more than 400 years." P. 473.

First we find Mr. Oliphant saying:

"The new-fangled *tea is being made*, or any such-like construction, was not in vogue until about 1770." "Owing to this confusion, a wholly new English idiom was produced about 1770." *The Old and Middle English* (1878), pp. 337, 389.

Mr. Oliphant is here indebted to me, though I am unmentioned, and not even alluded to. In my *English Adjectives in -able* (1877), p. 28, foot-note, I quote "there *is* a good opera now *being acted*," and, "Sir Guy Carlton *was . . . being examined*," from letters of Mrs. James Harris (1769), and her husband the famous philologist (1779), respectively.

Desiring to be quite sure about these passages, I addressed a note to the late Earl of Malmesbury, the editor of the work in which they occur, begging him to look at their originals. The Earl thereupon wrote to me: "In reply to your note respecting the diction of the First Lord Malmesbury's letters, I beg to inform you that the manuscript was copied literally, and in no degree altered."

In *The New English* (1886), vol. ii., p. 188, foot-note, Mr. Oliphant says of me: "He seems unaware of the fact that the idiom was anything but new." Its antiquity he professes to have shown in vol. i., p. 273, and vol. ii., p. 58.

The "two examples more than 300 years older" than 1770, which Mr. Ramsey refers to, I have proved, in this journal, vol. xliv., p. 447 (1887), to be forgeries of Mr. Oliphant, if interpolation is forgery. This matter, I may add, has been examined by Mr. R. O. Williams, in *Our Dictionaries*, etc. (1890), pp. 40, 41 and p. 138.

Again, in this journal, vol. xlv., p. 313 (1887), I have pointed out that Mr. Oliphant was misled, by unscrupulous editing, in his representation that "Italy *is being held* dangerous" fell from the pen of a letter-writer in 1611.

My discussion of English Imperfects Passive, in *Modern English* (1873), pp. 321–359 and 368, seems, by the by, to have escaped Mr. Ramsey's researches.

Anticipating, it may be, the emergence of constructions like those in question is, "we *'re* still *a being robbed*," quoted in this journal, vol. xlv., p. 156 (1887), from *The Villain*, by Thomas Porter (1663).

Earlier, by upwards of a century, than the quotations given above from the Harrises is the following, which, if clear of corruption, is critically in point:

"Thence Creed and I, by water, up to Fox Hall, and over against it stopped, thinking to see some Cock-fighting; but it *was* just *being done*, and, therefore back again to Spring Garden." Samuel Pepys (June 3, 1667), *Diary*, etc. (1875-79), vol. iv., p. 357.

This sentence, taken from the Rev. Mynors Bright's edition of Pepys, does not appear among the excerpts previously published by Lord Braybrooke.

The Rev. Prof. Skeat, with his never-failing kindness, informs me, in reply to an inquiry relating to the sentence, that he believes Mr. Bright has been dead some years,* and adds: "I do not know who now can read Pepys' cipher." He also says, in the letter from which I am quoting: "I quite believe that *is being* can boast of no 'early instances.' I know of none."

In Mr. Williams's book which I have already named, Miss Austen's "for, as to Frank, it *was* more than *being* tacitly *brought up* as his uncle's heir" is cited as if it exemplified locutions like *is being built*. But Miss Austen's "being brought up," instead of forming part of an imperfect tense, is a passive gerund, forming part of a phrasal nominative after "was," the nominative before which is "it."

From "it is not shooting, but being shot, that I object to," who would think of extracting "is being shot," as an imperfect?

Further remarks on the style of construction about which Mr. Ramsey has repeated an exploded misstatement, I postpone to another occasion. F. H.

Marlesford, England, August 4, 1892.

* Mr. Bright died in 1883.—Ed. Nation.

Notes.

Henry Holt & Co. have in press the second volume of Ten Brink's 'Early English Literature'; 'German Literature in its Chief Epochs,' by Prof. Kuno Francke of Harvard; a translation of Prof. R. Falkenberg's 'History of Modern Philosophy,' from Nicholas of Cusa to the present time; 'Hume,' by Prof. Aikens of Trinity, N. C.; 'Hegel,' by Prof. Royce of Harvard; a 'Dictionary of Botanical Terms,' popular as well as scientific, by A. A. Crozier; and 'Physics,' by Prof. George F. Barker of the University of Pennsylvania.

G. P. Putnam's Sons announce that they have in preparation an edition of the writings of Thomas Paine, edited by his latest biographer, Mr. Moncure D. Conway. It will make two or three volumes uniform with the Life, with divisions (1) political and sociological, and (2) religious and literary; and the reprint will be from the original publications. Mr. Conway will furnish notes. The undertaking is much to be commended.

The Shakspere Society of New York propose a four-text edition of "Hamlet," to be sold to 750 subscribers. In exact facsimile the texts of 1603, 1604, 1623, will be paralleled with an eclectic modern text, and accompanied by a translation of the German version performed in Dresden in 1603. The volume will be luxuriously got up.

Macmillan & Co. have in press 'Children of the King,' a new novel by F. Marion Crawford. The 'Letters of Charles Dickens,' which originally appeared in three octavo volumes, are to be compressed by the same firm into one volume, uniform with their current popular edition of the novels.

Ginn & Co. promise in the fall 'An Introduction to Narrative Greek Composition,' by Prof. Morris H. Morgan of Harvard.

The letters, etc., of Columbus have been collected in English version by Mr. Paul Leicester Ford, in a volume called 'Writings of Christopher Columbus,' which will shortly be published by Charles L. Webster & Co., who announce also 'Autobiographia; or, the Story of a Life,' selections from the prose writings of Walt Whitman, by Arthur Stedman.

The Century Company's fall list includes, besides Mr. Cole's 'Old Italian Masters,' several other reprints from the *Century*, viz., Mrs. Van Rensselaer's 'English Cathedrals,' illustrated by Joseph Pennell—in two editions; 'Plays in Provence,' by the same artist in collaboration with Mrs. Pennell; Dr. Weir Mitchell's 'Characteristics'; Dr. J. M. Buckley's 'Faith-Healing, Christian Science, and Kindred Phenomena,' and a new edition of Frank Stockton's works in five volumes, sold only in sets.

The Hakluyt Society are about to issue, in two volumes, Pietro della Valle's eight letters from India, edited by Mr. Edward Grey, late of the Bengal Civil Service. The same society will issue next year, also in two volumes, the voyages of Capt. Luke Foce and Capt. James to Hudson's Bay, edited by Mr. Miller Christy. Mr. Clements Markham, the distinguished President of the Society, has lately been stay-

ing at Genoa and studying the Columbian records. He has promised to contribute a collection of unpublished early voyages to America —fragments relating to Cabot, Cortereal, Vespucci, and Verrazzano. Mr. Delmar Morgan, the genial Honorary Secretary of the Hakluyt, has in contemplation the publication of an edition of the letters of Peter Martyr d'Anghiera, the chronicler of the great events of the reign of Ferdinand and Isabella. Meanwhile, Dr. Robert Brown's edition of Leo Africanus is nearly ready for the printer; and the same may be said of a book on early English voyages to the Levant, with some account of the Levant Company, by Mr. Theodore Bent. Mr. Everard im Thurm, who is now in England on leave of absence from British Guiana, hopes to devote two months of work at Torquay this autumn to his edition of Schomburgk's very admirable volume of Sir Walter Raleigh's 'Empire of Guiana.'

The latest step in the popularization of critical views about the composite structure of the Pentateuch is taken in Prof. E. C. Bissell's 'Genesis Printed in Colors' (Hartford: Belknap & Warfield). Each supposed documentary source or fragment has its own color of type, and the result is a typographically well-executed and graphic presentation of the scheme of textual analysis adopted by Kautzsch and Socin. Prof. Bissell himself does not go with the critics, and in a brief introduction makes an assault upon their methods and results. This lends a curious impression to his book, as if it were a testimony to the robustness of his own faith: he reasserts the old opinion in the face of the demonstration that it is no longer tenable.

'Poor's Manual of the Railroads of the United States' (New York: H. V. & H. W. Poor) rounds out its twenty-fifth year with its present issue. In the quarter century the task of the editors has grown from dealing with 39,250 miles of road to dealing with nearly four times that number (170,601 on January 1, 1892). The tonnage in the same period has increased fifteen fold. When to these simple figures we add the capital invested and the number of persons dependent upon or immediately affected by the railroad system, the folly of strikers who think the fiat of a "lodge" can withstand the weight of such an interest, becomes apparent. The Messrs. Poor themselves succumb to it, for in order to keep their volume within bounds they are constrained to separate some matters for issue in a new form, viz., 'Poor's Directory of Railway Officials' and 'Poor's Handbook of Investment Securities,' which must share the authoritative character of the older publication.

Two bibliographies are on our table, one a "List of Books relating to Aaron Burr," by Hamilton Bullock Tompkins (Brooklyn: Historical Printing Club). This fills eighty-three pages and as many leaves, and indicates in what public libraries the books may be found. The other work is a 'Homœopathic Bibliography of the United States (1825-1891),' by Thomas Lindsley Bradford, M.D. (Philadelphia: Boericke & Tafel), a work of large proportions—nearly 600 pages—and seemingly conscientiously executed. It deals not only with books, and with books *con* as well as *pro*, but with societies, colleges, hospitals, dispensaries, pharmacies, and, synoptically, medical legislation in the several States.

In reprints, we have 'Three Feathers' and 'Madcap Violet,' in the Harpers' uniform series of William Black's novels; 'The Old Curiosity Shop,' with 'Master Humphrey's Clock,' and 'Martin Chuzzlewit,' in Charles Dickens 'the younger's reproduction of first editions of his father's works (Macmillian); and two final volumes in Roberts Bros.' edition of Jane Austen. The first call for no special remark. The Dickens volumes have a particular interest for America, since the original scheme of 'Master Humphrey's Clock' involved a journey to the United States in search of material for that ill-conceived periodical, and 'Martin Chuzzlewit,' if not a product of the journey, profited by it, and was laid to the charge of Dickens along with the 'American Notes.' The introductions give all necessary bibliographical information, and the original illustrations are reproduced. The posthumous 'Lady Susan' and 'The Watsons,' together with Mr. Austen Leigh's memoir of his aunt, fill one of the pretty volumes of the Messrs. Roberts. The other consists of a selection of letters of Jane Austen from Lord Brabourne's compilation. Miss Woolsey, who is responsible for this, furnishes a preface. The set is now capitally rounded out. Two portraits of the author are given in these last volumes, and a view of her burial-place in Winchester Cathedral.

The contrast between 'Young Lucretia, and Other Stories,' by Mary E. Wilkins (Harpers), and 'The Pot of Gold,' which was published contrary to her wish, is all in favor of the author's judgment. We willingly exchange the fantastic element of those earlier tales for these strong characters in plain setting. Miss Wilkins's children are as real as her grown people, and as distinctly possessed of the New England conscience which gives point to nearly all the stories. Her condensed style will especially suit young readers.

Any student who is industrious enough to keep a manuscript volume of notes and criticisms on his reading, and a scrap-book in connection with it, will find opportunity for still further labor, not without compensation, in T. E. Shields's ingenious 'Index Omnium' (Boston: Joseph Knight Co.). This provides for a catalogue of the books annotated, and a dictionary of leading words by which the thought or passage can be traced back to the author, or to the synopses and criticisms in the subsidiary volumes mentioned above. The nearly three thousand lines of entry for books read would serve, if one chose, for cataloguing a very respectable private library.

Two little volumes, the fruit of recent studies by Prof. A. Beljame, may be recommended to students of the French language, but also to those who would have a better knowledge of their own English tongue. One is a prose translation of Tennyson's 'Enoch Arden,' facing the original text; the other is the same poem annotated and supplied with very happy comparisons of Tennyson with himself and with other poets and writers, and an elaborate examination of the versification of 'Enoch Arden.' Add a sketch of the life of Tennyson, and a bibliography which enumerates translations into Latin, German, Spanish, Dutch, Hungarian, Italian, Norwegian, Czech, and French—for Prof. Beljame has had predecessors. His publisher is Hachette.

From Hachette, too (Boston: Carl Schoenhof), comes a school edition of Manzoni's 'I Promessi Sposi' in pocket form, and therefore, of course, abridged; the sequel of the story after the flight of "the betrothed" being discarded. There are notes and a partial vocabulary.

The eleventh annual report of the Dante Society at Cambridge, Mass., reveals an increasing membership and one very notable loss—the late Mr. Lowell. Prof. Carpenter concludes his valuable reproduction of documents concerning Dante's public life. Mr. William C. Lane, with his customary skill, records the additions to the Dante collection in the Harvard Library. A Harvard Annex prize essay of last year, by Lucy Allen Paton, concludes the pamphlet, and will be read with profit. The subject is Dante's personal character, and for the major part is adequately treated, with some painstaking inductions and references for which students will be grateful to the author.

The old records of the ancient English Colony of Barbados are being now recopied at the public expense. Although the colony was planted as far back as 1627, fires and hurricanes have wrought havoc among its archives, and historical students will be glad to learn that a fair number of papers date as far back as 1640.

Americans who may be engaged upon historical researches should know that the branch of the Record Office, London, where the papers relating to America and the Plantations are dealt with, is now in charge of Mr. Hubert Hall, who is a most efficient successor to Mr. Noel Sainsbury.

Prof. W. M. Davis has recently published an interesting article upon winter thunderstorms, in which, from comparison of observations, he finds that while such storms are indeed less common in winter than in summer, those which do occur during the cold season are chiefly at night and near the coast. He concludes that the convectional origin of summer thunder-storms implies a like origin for such storms in winter, near or upon the ocean, even if they are chiefly nocturnal. He regards them provisionally as chiefly dependent upon a pronounced vertical temperature gradient, which may be determined partly by the cooling of the upper air by radiation about the lofty cloud stratum of cyclonic storms, and partly by the maintenance of relatively high temperatures in the lower air by the conservative power of the ocean.

At a recent meeting of the Royal Meteorological Society, Mr. E. J. Lowe read a paper upon raindrops. By careful study, and after making more than three hundred sketches, he has developed some curious facts relating to the varieties in raindrops—subjects wherein the careless observer would have said no difference could exist. An ingenious method of preserving their forms was described. By means of slates ruled in inch squares and made in book form, to be capable of instant closing, the splash of the drop was accurately obtained, and afterwards copied upon paper similarly ruled. It was found that some drops make a clean, circular spot, others show splashes about the edge, and some drops seem to be actually hollow, failing to wet the whole surface enclosed. The size varies from a mere point to a spot of at least two inches in diameter. Mr. Lowe exhibited, also, diagrams of interest as showing the shapes of low-lying mist-drops, and of the forms taken by melting snowflakes.

— The September *Atlantic* gives little occasion for comment. Apart from the serials, which occupy the space of the number to an unusual degree, room is found for a nature paper from the sympathetic pen of Olive Thorne Miller, under the clever but misleading title, "Cliff-Dwellers in the Cañon"; for a "Memory" paper, which contains a pre-natal reminiscence of the sort collected by psychical-research societies; and for a seasonable paper on the worn but important subject of how to teach literature in the schools, by Mr. Horace E. Scudder. It is not the first time that Mr. Scudder has urged the desirability of a more

rational method in the younger reading-classes, and, indeed, so much has been said in all quarters that nothing remains except to keep the subject alive and, if possible, troublesome, in the hope of wearing out the stolid conservatism of the "committeemen" by importunity, or of exciting the routine-drilled teacher to experiment by reiterated advice and encouragement. It may be suspected that one difficulty in the way is that such articles do not reach the power in control—that is, the school board; and teachers seem rather to rely on purely educational publications in which they have a voice, or, at least, find these topics treated from the pedagogic point of view. Mr. Scudder treats the subject from the position of a man of letters who believes in the educating power of literature as one of its great functions; and the methods he suggests of preparing the minds of school-children from the start, so that they shall come to the appreciation of the best books as naturally as they pass from arithmetic to geometry, are such as have been widely approved by thinking literary men, and should have entered upon the practical stage of reform before now. The poet Whittier pays a tribute to Dr. Holmes upon the occasion of his birthday, in lines which reflect the serenity and pleasantness of his own old age.

—*Harper's* continues the thumb-nail review of Parisian literary celebrities, or pseudo-celebrities, by Theodore Child, and at the head are placed the cultivators of "egoism" on the one hand and the followers of Vogüé on the other, as the present players on that stage of the coteries which has been contemporary with literature in Paris; and the author winds up with sketches of the old lions, the dramatists, and the editors. The most spirited paper is Mr. Martin's sporting contribution, describing fox-hunting in the Genesee Valley, where all the conditions for the sport exist in ideal perfection. Mr. Ralph writes of the State of Washington in his usual vein, and the back-country town-meeting is again described as "The Aryan Mark" by Miss Anna C. Brackett, while Mr. Howard Pyle pictures better than he describes the Sand-Hills. The most curious paper is Mr. Hutton's series of illustrations of death-masks, ranging from Dante to "Ben Caunt," with its thoroughly informed and lightly worded text.

—The *Century* contains a full account of the exploration of the Grand Falls of Labrador last summer by Henry G. Bryant, illustrated with several views which give us the first ocular knowledge of this great natural feature of the North, which has so long lain just beyond our horizon. The expedition was made at the same time the Bowdoin College party set out with the same object, and a narrative of the experience of the latter has been told, as Mr. Bryant remarks, in a scientific publication; but he was more fortunate in reaching results, and brought back measurements and photographs. The height of the principal fall is 816 feet, and the breadth about 50 yards, being narrowed in the rapids from a breadth of 300 yards a mile upstream. The story of the journey is told in an interesting way, and the wonder is that in these days the journey should have been so long unperformed, though not altogether unattempted. Alaska affords material for another paper of travel, and Mr. Roosevelt touches the same ground of interest in his Elk-Hunt in Northwestern Wyoming. Mr. Stedman concludes his papers on poetry; the Life of Columbus and the World's Fair series go on; and there is a large bunch of short stories. A welcome is given to Dvořák, whose portrait is the frontispiece; Mr. Theodore Robinson writes with enthusiasm, but not without restraint, of Monet; and Prof. Brander Matthews contributes a unique article upon artistic posters, mainly of Parisian origin, in which he confidently discerns the promise of a new, if humble, art.

—*Scribner's* brings forward the subject of the Tilden Library in this city, in regard to which Mr. John Bigelow makes several suggestions, the most important being the proposition to place it in Bryant Park and to give it a special cruciform shape, in adopting which it is possible that librarians and architects might agree. The study is a suggestive one, and the proposals made will no doubt receive proper consideration. The article upon "The Education of the Blind" gives information upon a subject which remains a mystery to most persons, and elucidates the different systems of printing; incidentally, too, by mention of a few cases of striking success in educating the blind, the author encourages increased interest in what is certainly one of the most fruitful of modern philanthropic efforts. The history of the buffalo, the prosperity of the Pueblo Indian, the Névsky Prospékt (in the series of Great Streets of the World), and French Classical Painting, are the remaining topics.

—Prof. James Bryce's interesting and suggestive address on the "Migrations of the Races of Men Considered Historically," delivered before the Royal Scottish Geographical Society at the inauguration of its London branch, is printed in the August number of the Society's magazine. After dwelling for a moment on the fact that geography is the meeting-point of the sciences, he defines the three different forms of the movements of population under the terms Transference, Dispersion, and Permeation. To the first of these belong the most of the prehistoric migrations and those which overthrew the Roman Empire. The second is the overflowing of a race into new lands, as the British into North America and Australia, or the Russians into Siberia. The third covers those instances in which "one race or nation so spreads over another race or nation its language, its literature, its religion, its institutions, its customs, or some one or more of these sources of influence, as to impart its own character to the nation so influenced, and thus to substitute its own for the original type." The earliest known instance of this diffusion is that of the Greeks over Asia Minor and the adjacent countries; a later, that of the Arabs over Syria, Egypt, and Northern Africa. Prof. Bryce suggests the possibility also of a similar result in India from English influence, without, however, any mixture of blood, "possibly with little social intimacy," between the European and native races. The main causes of these migrations are food, war, and labor; religion and love of freedom having operated rarely and with but comparatively small results. The lines followed by them have been usually those of least resistance, or, in other words, they have followed the "lines of equal mean temperature, and not so much, I think, of mean annual heat as of mean winter heat." The great movements of population Prof. Bryce divides into five epochs or groups, the prehistoric (including the Etruscan and Aryan, the earliest recorded); the Phœnician, Israelite, and Greek; that termed by the Germans the Wandering of the Peoples (*Völkerwanderung*); the Mohammedan; and the modern, beginning with the discovery of America. The latter is divided again into four great eras, that of the Spaniards into tropical America, the negroes from Africa, the English and French into North America, and the emigration from Europe within the last seventy years. A brief reference only is made to the analogy between these movements and those of animals and plants, as, for instance, the invasion of Europe in comparatively recent times by the brown rat, a native of Asia. In closing, Prof. Bryce gave reasons for the belief that the results of recent changes upon political organizations and types of human culture will be fewer and fewer, showing that since the eleventh century no new nation has arisen in Europe, nor has the migration of different races to America produced a new national type. The time is not far distant, however, when the habitable parts of the world will be filled and the outflow of the nations stopped, and then we may enter upon a "new era, whose phenomena will prove unlike any that have gone before."

—"Franklin Portraits" is a notable feature of the July Bulletin of the Boston Public Library, the list amounting to 239 numbers. The two oil paintings of Franklin—a Duplessis and a supposed Greuze—in the possession of the Library are very well copied by "process" to accompany the iconography. Besides this valuable achievement in a field heretofore little explored, the editors of the Bulletin annex a catalogue of the "John A. Lewis Library," now forming one of its most precious collections in the domain of early Boston books and Puritan literature. The volumes representing the Mather family alone exceed two hundred, and in addition to the large proportion of sermons embraced in them there are hundreds by various ministers, in the very titles of which are reflected the annals of New England, the polity of the Bay Colony, the morals and the superstitions of the time. Not a few of them, like multitudes since, doubtless deserved the running-title, "A manufactory sermon," innocently applied to the Rev. Thomas Barnard's discourse in 1758 before the Boston Society for Encouraging Industry and Employing the Poor. Others had serious occasion enough, like the common article of death, many worthies being commemorated at their taking off, as in Benjamin Colman's 'Ossa Josephi. Or, the Bones of Joseph. Considered in a sermon preached at the lecture in Boston after the funeral of the very honorable and excellent Joseph Dudley, Esq. [1720].' Comets always suggested a sermon, as one did to Increase Mather in 1682, viz., his 'Heaven's Alarm to the World. Or a sermon wherein is shewed that fearful sights and signs in heaven are the presages of great calamities at hand. Second impression.' Much more, of course, were earthquakes a godsend to the pulpit—"the works of God and tokens of his just displeasure," according to the Rev. Thomas Prince in 1727, who also traced in 1749, after an acute experience, "the natural and moral government and agency of God in causing droughts and rains." After Cotton Mather's 'Wonders of the Invisible World,' it is needless to cite the witchcraft sermons collected by Mr. Lewis. Increase Mather furnished 'The Answer of several ministers in and near Boston to that case of conscience, whether it is lawful for a man to marry his wives own sister,' as well as to the question, "whether it be lawful for a church-member among us to be frequently in taverns?" And he shot 'An Arrow against Profane and Promiscuous Dancing. Drawn out of the quiver of the Scriptures.' Joseph Seccombe, on the other hand, held 'Business and Diversion Inoffensive to God, and neces-

sary for the Comfort and Support of Human Society. A discourse uttered in part at Ammauskeeg-Falls, in the fishing-season." Apart from well-known New England rarities in this collection, we notice a 'Vade Mecum for America: or a Companion for Traders and Travellers' (Boston, 1732); a Hebrew Grammar for Harvard students (Boston, 1735); and Tully's "Cato Major" printed with explanatory notes of his own by Franklin in Philadelphia in 1744.

—Some of our readers who have known Mr. F. C. Penrose, supervising architect of St. Paul's in London, as Director of the British School of Archæology at Athens, will be interested to learn that the King of Greece has just conferred upon him the Golden Cross of the Order of the Saviour, to which not a few Hellenists of distinction, Prof. W. W. Goodwin among them, already belong. Meanwhile, Miss Emily Penrose, his daughter, has illustrated Somerville College, Oxford, by achieving a distinction never before won by any of her sex—a first-class in the Final School of Literæ Humaniores. The remarkable knowledge of History and Archæology which enabled her to win a distinction hitherto considered beyond a woman's reach, was well exemplified in a lecture on "Ancient Methods of Voting" which she gave at a friend's house in Oxford, just at the close of the recent heated electoral campaign. Miss Penrose has been presented to a Travelling Fellowship, and is now studying at Berlin. In the autumn she announces lectures on Greek and Roman history and archæology; some of them to be given (by permission of the Trustees) at the British Museum. Nor is this the only proof in store for us of the careful study of Greek that English women are now making. Following to some extent the example of Miss Harrison and Mrs. Verrall, Miss Eugénie Sellars is preparing a text, with translation and annotation, of those parts of the Elder Pliny's Natural History which bear upon Art and Archæology. This work is already so far advanced toward completion that its publication is arranged for.

STRACHEY'S HASTINGS AND THE ROHILLA WAR.

Hastings and the Rohilla War. By Sir John Strachey, G.C.S.I. Oxford: Clarendon Press; New York: Macmillan.

MACAULAY'S Essay on Warren Hastings has hitherto been accepted and admitted into the historical curriculum as not only a brilliant piece of narrative and rhetoric, but a faithful account of the events with which it deals and a genuine picture of the early period of British rule in India. As a study in history it ought now to be laid aside, however highly it may be admired as a specimen of narrative and rhetoric. With regard to the story of Nuncomar, Sir James Stephen seems to have conclusively proved that the famous essay is a tissue of brilliant fable. He has shown that Hastings had nothing whatever to do with the trial of Nuncomar for forgery, which arose out of a lawsuit long anterior to the existence of any collision or relations of any kind between the two men, or with his execution; that the charges against Impey of judicial murder and other outrages are baseless; that Nuncomar had a perfectly fair trial, though under a very harsh law; and that the general picture of misrule and oppression, though by no means imaginary, is, like most of Macaulay's pictures, monstrously overdrawn.

Sir John Strachey has now performed a similar operation with regard to the "Rohilla" charge. That charge was supposed to weigh most heavily of all on the memory of Hastings. It had never been judicially investigated, Pitt having refused to impeach upon it, though he turned round and with his obedient train of followers voted for impeachment on the charge of extortion practised on Cheyte Singh, which is now, we believe, held to have been groundless, Cheyte Singh having been in reality required to pay no more than was due by the terms on which he held his fief, or than a native suzerain would have exacted. The charge continued, therefore, to pass current and obtain universal credence in Burke's rhetorical or super-rhetorical version; and the author of the last Life of Burke, Mr. John Morley, accepts it without hesitation and moralizes in the usual strain. It is now, apparently, disproved. The belief embodied in Macaulay's Essay is that the Rohillas were a nation of virtuous and prosperous husbandmen and mechanics, "not negligent," to use Macaulay's expression, "of rhetoric and poetry"; that they were invaded without cause and ruthlessly exterminated, while their smiling land was made a waste, by the Nabob Vizier of Oude; and that Hastings sold for a great sum the services of the British Army as auxiliaries in the invasion and extermination. The facts now, if we may trust Sir John Strachey, turn out to be that the Rohillas were not a nation at all, but a tribe of Afghan freebooters who had planted themselves in the midst of a conquered Hindu population and subsisted upon the labor of their subjects, not tilling the earth themselves nor pursuing any art or trade but war; that they had got, against the faith of a treaty, into sinister relations with the Mahrattas, and were threatening to lay open Oude, and ultimately the British Dominion, to the devastating inroads of those terrible marauders; that Hastings, in lending the Nabob the assistance of the British forces, was therefore pursuing a virtually defensive policy and violating no rule of public morality—certainly no rule recognized in the political ethics of Hindustan; and that the payment for the troops was taken from the Nabob not as a bribe, or as the hire of mere mercenaries, but in fulfilment of a regular agreement that the cost should be so defrayed when British troops were employed beyond the limits of their own territory. Not a Rohilla, it seems, can be proved to have been killed except in battle, and a portion only of them were ultimately banished from the country. Excesses were committed by the Nabob's army, as excesses are committed in all Hindu wars, but were deprecated and restrained instead of being cynically defended, as it has been alleged that they were, by Hastings. The native Hindu population, instead of being extirpated, had reason, when the war was over, to rejoice in their change of masters, and the land smiled more than ever. The only thing which lends color, it appears, to the black version of the affair given by Burke, and which his magnificent rhetoric has made familiar to all fancies, is the natural but compromising anxiety of Hastings to prove to his mercantile employers, the directors of the East India Company, that the transaction had been to their pecuniary advantage. A ridiculous feature of the fictitious indictment is the confusion into which the accusers fell of Hafiz Khan, an Afghan chief, who paid his tribute to the established custom of his clan by composing a lay of some kind, with Hafiz, the great Persian poet of the fourteenth century, whence Macaulay has distilled his general description of the people as "not negligent of poetry or rhetoric."

Sir John Strachey is disposed to exonerate Macaulay, whom he seems to regard with a somewhat Eastern veneration, on the ground that Macaulay only implicitly followed James Mill, the historian of India, without making any independent inquiry. To follow blindly a writer whose leaning is unmistakable, in a case where his bias was sure to be peculiarly strong and where justice to great characters was involved, is certainly less culpable than fabrication; but the amplification and exaggeration are Macaulay's own. In the case of Impey, he cannot be acquitted of a still graver offence. Impey's son put forth, after the publication of Macaulay's Essay, a defence of his father's memory. The book was the work of a man devoid of literary and controversial skill, but it brought to light certain facts, at once incontrovertible and momentous, such as that Impey had been arraigned before the House of Commons and formally acquitted, and that, at the trial of Nuncomar, he sat not alone but with three colleagues on the bench whose impartiality was open to no suspicion. Macaulay must have seen the book, and he could have had no answer to its statements, but, trusting, with too much reason, to its unreadable character and to the popular qualities of his own Essay, he continued to circulate charges against Impey's memory of the grossest kind, which he must thenceforth have known to be, in part at least, untrue. It is astonishing that he should not have been aware from his own knowledge of Parliamentary history that the charge of judicially murdering Nuncomar by the hand of Impey had been thrown out by Burke against Hastings in Westminster Hall, no doubt under the inspiration of Francis, and had been formally disclaimed by the House of Commons, which censured Burke for having made it, while Burke never attempted to vindicate himself by substantiating the charge. We will venture to say that no one who has compared Macaulay's Essay with the critiques of Sir James Stephen and Sir John Strachey, will ever again feel implicit faith in Macaulay as an historian.

Burke fell a victim to the malignant infusions of Francis, the deadly personal enemy of Hastings, combined with his own generous but uncontrolled sympathies and his rich but delusive imagination. How far he was carried away appears from his having insisted that Francis, who had fought a duel with Hastings, should be one of the managers of the impeachment—an indecency upon which Pitt, of course, put his veto. His emotions completely overcame his sense of justice. The articles of impeachment drawn by him are pronounced by Sir James Stephen "as shuffling and disingenuous in substance as they are clumsy, awkward, and intricate in form." "They are," says Sir James Stephen, "extremely tricky, very full of insinuations, and covering by their profusion of irrelevant matter the total (and no doubt designed) absence of averments essential to the conclusion which they are meant to support." The language of Burke's speeches in Westminster Hall is incredibly rabid and indecent, especially when it is considered that Hastings, who was present, had at all events filled high imperial office and done great things. Mr. Law, Hastings's counsel, did not very much exaggerate in saying that "the lowest blackguard in a bear-garden would have been ashamed of some of the expressions." Sir J. Strachey quotes some examples:

"For years he [Hastings] lay down upon that sty of disgrace, fattening in it, lying,

feeding upon that offal of disgrace and excrement and everything that can be opprobious to the human mind." "Such are the damned and damnable proceedings of a judge in hell, and such a judge was Warren Hastings." "A wild beast when his belly is full may be pleased and lick your hand. You might have a serene day under such a beast, but can you under that man Hastings?" "A captain-general of iniquity, thief, tyrant, robber, cheat, sharper, swindler; we call him all these names, and are very sorry that the English language does not afford terms equal to the enormity of his offence." "Sir Walter Raleigh was called a spider of hell. This was foolish and indecent in Lord Coke. Had he been a manager on this trial he would have been guilty of a neglect of duty had he not called the prisoner a spider of hell." "What! compare this man, a bullock-driver [Hastings was alleged to have had something to do with a contract for bullocks], with Tamerlane and those conquerors! When God punished Pharaoh and Egypt, he did not send armies but lice and locusts to lay the land waste."

The want of good sense and self-control displayed in these outbreaks, the list of which might be lengthened and which are not without their counterpart in Burke's Parliamentary speeches, must be held in some measure to account for what has been deemed his unjust exclusion from the Cabinet, though aristocratic prejudice may also have been in part the cause. The language of Hastings, on the other hand, is uniformly dignified, calm, and indicative of a self-possession such as we might expect in the man whose courage, unquailing in extremity, enabled him, when he was beset by an infuriated populace at Benares and in the utmost peril of his life, to send out two despatches, one ordering the commander of the troops at the nearest station to hasten to his assistance, the other giving directions for the prosecution of an extensive scheme of policy in which he was engaged. It is not easy for conquerors to be moral, least of all when they are contending with Mahrattas and with powers of wrong and rapine such as dominated amidst the wreck of the Mogul Empire. But Hastings was no mere marauder or tyrant; he was a great ruler after his kind, and his rule was felt to be at least comparatively beneficial, and a refuge from the plundering anarchy which reigned around, by those over whom he ruled. From personal corruption, whether in the Rohilla affair or any other, he is admitted to have been free.

Some of the most sagacious and patriotic of Englishmen have doubted whether England did what was best for herself in assuming the political dominion of India, and whether she would not have done more wisely had she been content with the possession of stations for her trade. We may all doubt whether conquest can really and permanently be made the instrument of civilization, while we cannot help admitting that the British Empire in India is the greatest experiment of that kind. But no one will doubt that the story of the Empire is worth telling as a record of the energy, fortitude, and administrative power of our race; and we cordially agree with Sir John Strachey in lamenting that it has not up to this present time been well told. Nothing but a history at once true and readable will displace from popular fancy the brilliant rhetoric of Macaulay.

FREEMAN'S HISTORY OF SICILY.

The History of Sicily from the Earliest Times. Vol. III. The Athenian and Carthaginian Invasions. By Edward A. Freeman. Macmillan & Co. 1892. Pp. xxxv, 750.

JUST as this volume issued from the press a few months ago, Prof. Freeman was suddenly stricken by smallpox in Spain, and died. We may say, without disparagement, that Freeman's position as an historian was already established, and could not have been changed had he lived to produce many more volumes of the gigantic history on which he was engaged at the time of his death. At seventy, an author's methods are fixed, his message is known; we need expect from him no further surprise, but confirmation in various forms of his life-long opinions, and the reiteration of mannerisms which perhaps astonished when they were fresh, but grow tedious with age. In the volume before us, Freeman comes into direct competition with precisely the noblest specimen of historical writing which has ever been produced. The account which Thucydides has left of the Sicilian Expedition remains, after two-and-twenty centuries, the model, whether of historical depth and accuracy or of historical narration. It is, indeed, the only record we have of that most momentous episode, and we believe it is trustworthy, not because we can or cannot corroborate it, but because we perceive that Thucydides was one of those rare men who, by a law of their being, tell the truth. If he ever misstated, if he was silent on points about which we should be glad of information, we may be sure that he did not intend to falsify or to suppress. The sixth and seventh books of his history, which chronicle the arrogant ambition and the appalling disaster of the Athenians at Syracuse, being thus acknowledged not only masterpieces of historical composition, but also the sole adequate source from which an account of those events can be drawn, it would seem almost superfluous for a modern historian to attempt to compete with them. He cannot add much to the substance they contain, he cannot improve upon the manner in which they are presented: what, then, can he do?

For one thing, he can interpret them so that they shall be wholly intelligible to readers to-day. Thucydides, writing as a contemporary, could not possibly foresee the ultimate significance of the actions he described; a modern can discern the bearing of those actions, not only upon the immediate destiny of Athens and Spar a and Syracuse, but also upon the development of the world's history. Again, many allusions which were easily understood by Thucydides's fellows, now need explanation; much that they would take for granted now needs to be set down. And, finally, there is a good deal of journeyman's work to be done in reconciling textual contradictions and in settling moot points in topography. To do these things is Freeman's especial task, and in doing them he is aided by the results of recent archæologists and by his own indefatigable search for microscopic facts that may shed light on the main theme. He has, moreover, the advantage of treating the subject from the Sicilian point of view. Other historians have dealt with the Sicilian Expedition as an offshoot from the Peloponnesian War, or as a critical episode in the career of Athens; he deals with it as an experience in the career of Sicily. And though we may deplore the ruin of Athens which it involved, nevertheless we cannot help feeling that the result, so far as Syracuse was concerned, was just, nor can we withhold from the Syracusans who successfully resisted the aggression of the Athenians, admiration similar to that which we feel for any other people that fought for independence. To bring this side out clearly is one of the most important of Freeman's achievements.

But we suspect that to scholars his work will commend itself chiefly by its minute discussion of matters which are of peculiar interest to scholars. He has succeeded in locating the position of the various Athenian encampments, of the lines of circumvallation and counter lines, and of the route taken by Nicias on his retreat. He has examined, literally, every square rod of the site of Syracuse; he has drawn inferences from the wheel-marks in this place and from the traces of masonry in that; he has speculated as to the probable changes in the coast-line of the Great Harbor and as to the extent of the swamp of Lysimeleia. For one who has made no personal inspection of these things on the spot, it is unbecoming to presume to decide whether Freeman's conclusions are always correct; we may say, however, that, having seen some of the great battlefields of antiquity and of modern times, and many of the chief ruins of Greece and Italy, we are a little sceptical as to the possibility of establishing, after twenty centuries' obliteration, the site of a vanished palisade. Without for a moment belittling the real triumphs of archæology, we still find ourselves distrusting much of its circumstantial evidence. Perhaps the best reason for thinking that Freeman's plan is, in the main, correct, is the fact that by it we are able to follow Thucydides's account, which has hitherto seemed, in part, to offer conflicting statements as to the topography. Nevertheless, though from the standpoint of archæology this be an important gain, it is not of corresponding importance from the standpoint of history; for history is chiefly concerned with actions and results, and in her view it matters comparatively little whether the double walls of the Athenians came down to the shore a furlong to the north or south of the spot which Freeman assigns.

His propensity for investigations of this kind certainly impairs the interest of his work to the general reader, because it breaks in too often upon the flow of narrative, and, by constantly diverting the attention to details, lessens the effectiveness of those passages which the general reader and the specialist would alike agree in pronouncing the most memorable. It is to be observed, too, that these digressions often beget no facts, but only one or more conjectures; for, as we have remarked, all that we know of the Sicilian Expedition from contemporary and authentic sources comes from Thucydides. Diodorus Siculus wrote three centuries and a half later, and his account of the expedition is muddled, incomplete, and superficial—so much so, indeed, that we can hardly believe that he had Thucydides's work to guide him. Plutarch, in his lives of Alcibiades and Nicias, is the only other authority, and, though Plutarch made good use of the material that reached him, still he lived as long after the siege of Syracuse as we after the wars of the Roses. To piece out Thucydides with such scraps as Diodorus and Plutarch afford, and with such allusions as are found in other classic writers is, therefore, a task of not great extent. The number of facts cannot be added to; additions can come only by inferences and conjectures. At this work Freeman has few equals, as a single illustration will show. Thucydides mentions the towns of Centuripa, Hyccara, and Inessa; in the text the definite article happens to be omitted before the first two. From this omission, which a casual reader might attribute to the inaccuracy of some early copyist, Freeman deduces the following: "Thucydides did not expect his readers to have heard of Centuripa, any more than of Hyccara in vi, 62, 3. Most likely he had never heard of those towns himself till he heard of these particular facts

about them. *He therefore gives them no article.* Inessa, which had played so great a part in Sicilian history, he knew even when writing his earlier books. *To Inessa, therefore, he gave the article.* Much of the life of a great original writer is lost when these delicacies are neglected in modern reproduction" (p. 205, note 2). We have italicized the two sentences in which Freeman, who starts with a vague assumption, states a conclusion with extreme positiveness; but, we ask, by what rule of logic can a positive conclusion be derived from premises based on assumed probability? This is Freeman's habitual method in clearing up difficulties; and while no one can deny that his theory is often very plausible, the point to observe is that he sometimes mistakes plausibility for fact.

To give an example of his manner of expanding the brief statement of Thucydides into unnecessary prolixity, we will quote the following typical passage concerning the proceedings of the Athenians at Rhegium. Thucydides says:

"At length they reached Rhegium, the extreme point of Italy, where the fleet reunited. As they were not received within the walls, they encamped outside the city at the temple of Artemis; there they were provided by the inhabitants with a market, and, drawing up their ships on shore, they took a rest. They held a conference with the Rhegians, and pressed them, being Chalcidians themselves, to aid their Chalcidian kinsmen the Leontines. But the Rhegians replied that they would be neutral, and would only act in accordance with the decision of all the Italian Greeks." (Jowett's *Thucydides*, p. 440.)

Freeman's paraphrase runs thus:

"It was at Rhegium, the only ally of Athens, the far older enemy of Locri, a town which had fought on the Athenian side in earlier warfare, that the Athenian generals had most fully looked for welcome and alliance. The Chalcidians of Rhegium at all events must be ready to avenge the wrongs of their Chalcidian kinsfolk of Leontini, their fellows in the first alliance made between Athens and any Siciliot or Italiot city. At Rhegium the three divisions came together; a mighty show they must have made in the narrow waters. Here they did meet with better treatment than at Tarentum or Locri; but still very far beneath their hopes. They were allowed to draw up their ships on shore, and, as the historian emphatically adds, they rested. To Greek sailors the trireme, after all, was not a home for a long journey, but a means of conveyance and an engine of battle. Owing to the unfriendliness of the other towns, they had had to live almost wholly at their oars ever since they started from Corcyra. The rest at Rhegium must have been indeed welcome; but rest and food only were to be had. The army was quartered, and a market was found for them, outside the city, in the precinct of the Rhegine Artemis. But none were received within the walls, save those who went in the character of envoys, among whom we may fancy Alcibiades, rather than Nicias, taking the leading place. They addressed the Rhegine assembly, and called on them to join in helping their Leontine kinsfolk. The answer was that Rhegium would not act alone for either side, but do whatever was agreed on by the other Italiots." (Pp. 137-8.)

Let the reader compare this passage, in which we have not followed Freeman's whimsical "reformed" spelling of proper names, with the extract from Thucydides, and decide for himself whether the trebling in length is accompanied by any material gain in vividness or precision, or by any addition of genuine facts. Such a comparison will serve, better than much criticism from us could serve, to explain both Freeman's method and why it is that his volumes swell to so huge a bulk. At times his work seems not so much a history as a series of theses such as candidates for the doctor's degree prepare for the delectation of the faculty of a German university.

We have given so much attention to what some persons may think minor details, because it is to minor details that Freeman gives most attention. He has his own view of the significance of the great struggle he is describing, but his passion for the minutiæ of topography and archæology too frequently obscures this view. There are days and weeks concerning which we have not an authentic fact, but Freeman will not pass them over in silence; he must fill the void with conjectures as to what was doing; and the result is, that he detracts somewhat from the impressiveness of the really great crises in which he has been guided by the clear light of Thucydides's narrative. He has done well to give Hermocrates due prominence, because Hermocrates, besides being conspicuous as a leader of the Syracusans, was the first to lay down that programme of "Sicily for the Sicilians" which reappears from age to age as the central political ideal of the Sicilians, down to the extinction of the Bourbon tyranny a generation ago. He also emphasizes, as he should, that remarkable speech of Athenagoras in which the principles of true democracy are stated with startling clearness. His portraits of Nicias, Alcibiades, and Demosthenes have no new touches, but he exceeds previous historians in attributing great qualities to Lamachus, who may have been the consummate hero Freeman would have us believe, but whose claim to that distinction rests on insufficient evidence. In its way, there is nothing better in this volume than the description of the devices by which the elder Dionysius became the tyrant of Syracuse; we wonder that Freeman, who sometimes makes effective use of historical parallels, did not suggest a comparison between Dionysius and Louis Napoleon, between whom, in their rise to despotism, many resemblances exist. Certainly, Freeman errs when he implies that the autocratic position of Dionysius at Syracuse in B.C. 405 has a counterpart in the position of Abraham Lincoln during our Civil War (p. 555). We Americans have reached the time when we see that Lincoln was the central figure on the Northern side during the Rebellion, and when, speaking roughly, we say that he represents the cause of the Union, just as we say, speaking roughly, that Washington embodies the cause of the colonies during the Revolutionary War; but every American knows that Lincoln was not a dictator, that he was under the restraint of Congress just as Congress was hemmed in by public opinion, and that he could not possibly have made peace, or taken any other vital step, without the approval of both Congress and public opinion. And had he aimed at dictatorial power for himself, had his ambition been like that of a Cromwell or a Napoleon, he would have sought in vain for subservient accomplices. Dionysius, on the contrary, found a willing multitude ready to confer upon him autocratic privileges.

To only one other of Freeman's general criticisms have we space to allude. He exaggerates the rashness of the Athenians in sending the first expedition against Syracuse. Judging their decision by its disastrous results, it is easy enough to brand it as foolhardy. Freeman goes farther. He can scarcely conceive how a people in its right senses could be lured into such an expedition. He quotes with approval the words of Joseph Butler: "Why might not whole communities and public bodies be seized with fits of insanity as well as individuals? Nothing but this principle, that they are liable to insanity equally at least with private persons, can account for the major part of the transactions which we read in history" (p. 108). Freeman cites England's reckless plunge into the Crimean War, and the French expedition to Egypt in 1798, as modern examples of national mental aberration. It is of course possible that a person or a nation that adopts a policy which you would not adopt may be insane; certainly, it is flattering to your own sanity to hold this opinion; but, on the whole, it is wiser to endeavor to understand the motives which caused the adoption of that policy than to indulge in self-laudation, for two persons may be thoroughly rational though they cannot be stirred by the same motives. And in the case of the Athenians in B.C. 416 we shall discover reasons which, at the time, might have persuaded any people, the most rational, without rousing against it the suspicion of lunacy. The decision was not taken hastily; for months before the matter came to a popular vote, it had been agitated, and, having been once decided, it was brought up for reconsideration, an unusual proceeding, by the cautious Nicias. Grote has stated all this so clearly, and has given so cogently the various reasons which justified the Athenians in embracing this project, that we need only refer the reader to him.

And now we must apply the last test to Freeman's history—the test of style; for on this, in the end, the permanence of all histories depends. It is not enough that an historian be erudite and painstaking, not enough that his facts be precise, in order that his work shall endure. Later discoveries may reveal new data, and the circle of erudition constantly widens. His work, therefore, must have form, symmetry, vividness, life, and charm; and to produce these he must have the poet's imagination. In these days, we take it for granted that the historian has the scholar's equipment, but we have been taught to look suspiciously on any manifestation of the imagination; yet without its agency nothing enduring can be produced, because it is the organ which sifts the essential from the non-essential, which penetrates deepest, which discerns the farthest-reaching relations and laws, and which synthesizes and creates. Freeman possesses the synthetic faculty to a great degree, as he proves by stating that the chief purpose of his history is to show how Sicily has been the pivot on which the everlasting struggle between the Semitic and Aryan races has turned, and the battlefield of many nations. He has succeeded in these first volumes in keeping distinct the character of the diverse settlements in Sicily—not confounding Sicel with Elymian, nor Sican with Phœnician—and in tracing wherever possible the influence of the parent cities of Hellas upon their colonies. This is quite as necessary in the history of Sicily as in a history of the American colonies; for Segesta and Selinus, to take only one example, had no more in common than had Virginia and Louisiana under the reign of George II. But while Freeman understands what is essential in the great currents of history, he does not succeed in selecting what is essential to his narrative. He is not a good story-teller, because, as we have said, he too often interrupts his story by digressions or overloads it with details. His attitude is that of a disputant; he has himself debated so long over many of the points he treats of that he cannot state his conclusion without showing that he would like nothing better than to fight anybody who differs from him.

A really great historian should bridle the disputatious tendency; he should state his opinions as emphatically as he chooses, but not

fill his pages with answers to possible critics. It is time to defend himself after he has been attacked. Such is the method of Gibbon in his famous chapter on the early Christians. He gives the results, but not all the processes by which he reaches those results; and he knows that in the end no amount of arguing can save him unless his conclusions are correct. So we think that Freeman's chapter on the Sicilian Expedition is inferior as a narrative to the account given both by Curtius and by Grote. He has not the consecutiveness of the former nor the symmetry and sweep of the latter; and they all fall short, of course, of Thucydides in those great passages in which the Greek historian has described the night attack on Epipolæ, or the naval battle in the harbor, or the tragic retreat and overwhelming of the Athenians. Some of the most interesting portions of Freeman's work are those in which he has not to compete with either Thucydides or Grote—portions of his ninth chapter, in which he relates the second Carthaginian invasion of Sicily and the destruction of the great cities. Yet even here we find no specimen of historical narrative worthy to be placed beside Hume's account of the last days of Mary Stuart, or Gibbon's description of the capture of Constantinople, or Macaulay's picture of the siege of Londonderry, or Carlyle's living story of the Feast of Pikes. These specimens, by men very different in methods and genius, all illustrate what great and permanent historical writing should be, and wherein it differs from the writing of historical disquisitions; and when we compare Freeman with these men, we are forced to the conclusion that he is not their peer. His work is an encyclopædia of historical facts, a storehouse in which he has garnered all that is known and most that has been conjectured concerning his subject; but it has not the artistic symmetry and selection, nor the vividness, nor the narrative swing, of a great history. Scholars will prize these volumes, and long be grateful to their author for the patient fidelity he bestowed upon them; we doubt whether they will take rank as literature.

In taking leave of this colossal fragment we cannot refrain from expressing regret that Freeman's instinct for thoroughness led him to alter his original purpose, which was to write the history of Sicily during the period of the Norman invasion and the rule of the Hohenstaufens. For this task no other man of our time was so well-fitted as he. But in order to be thorough, he decided to begin at the beginning, and the consequence is that his three volumes comprise more than 2,000 pages and bring us down only to the year 405 B.C. At that rate, he would have required a dozen more volumes to reach the Guiscards and Hauteville, and two or three volumes beyond those to reach Frederick II. In view of the fact that the history of ancient Sicily is comparatively well known, while that of mediæval Sicily is scarcely known at all by English readers, Freeman would have rendered a far greater service by presenting the latter than he has done by revamping the former.

THE LATEST YEAR BOOKS.

Year Books of the Reign of King Edward the Third. Year XV. Edited and translated by Luke Owen Pike. [Rolls Series.] Printed for Her Majesty's Stationery Office by Eyre & Spottiswoode. 1891.

In the last addition to the Year Books, the volume containing the reports of cases in Easter, Trinity, and Michaelmas Terms of 1341 (15 Edw. 3), while the editor remarks in his introduction upon several matters interesting to scholars, he mentions little of special legal importance. It is probable, however, that legal specialists will reap their own harvest even here. To them everything is grist; to know for certain that a given period contributes nothing to their purpose is a boon. The editor courteously acknowledges and puts into practice a suggestion made in these columns, that the number of the cases should appear at the head of each page; it is certainly a help to the reader. Better and more scholarly editing than Mr. Pike's it would be hard to find in any department of learning. Lawyers may be proud that their matters are now so worthily treated.

In case 55 (Michaelmas) there is a discussion over the statute *De Donis*. W. Thorpe presses a certain argument. "Perhaps so," says Scharshulle, J., "for Hillary and I pleaded such a plea before Scrope in the Eyre of Northampton, because we had no other matter; and the plea was pending the whole Eyre, and then was adjourned to this Court and was pending before Herle [C. J., 1327-1337]; and he said that the strongest argument against us which he knew was that Hengham [J. and C. J., 1272-1309], who drew the statute, construed it in another way." This adds to what is found in Fitzherbert. The circumstance that Hengham drew the statute *De Donis* is interesting; it was mentioned by Hengham himself in one of the Year Books of Edward I.

At p. 84 the reporter notes that "where, by an obligation, one was bound in forty marks, the plaintiff was barred by an acquittance which purported that he received ten marks in full satisfaction of forty marks." In a full record preserved by Mr. Pike, at p. 484, one may note the persistence of legal phraseology. A certain Richard recites that so and so "per scriptum suum perdonavit, relaxavit et omnino quietumclamavit ipsi Ricardo omnimodas actiones, querelas, et demandas, quas habuit, vel aliquo modo habere potuit, per viam compoti, debiti, aut alicujus alterius contractus, ab origine mundi usque diem confectionis prædicti scripti." It is no longer the fashion to put such things in Latin, but otherwise this is probably still good form in Wall Street.

At page 446 the reporter says:

"Note that John Leukenore and Elizabeth, his wife, did homage to William Thorpe in this way: Both held their hands joined between the hands of W. Thorpe, and the husband spoke in this form: 'We do you homage and bear faith to you, for the lands which we hold of A., your cognisor, who has granted to you our services in B. and C., and the other vills, &c., against all people, saving the faith which we owe to the King and his heirs and to our other lords.' And both kissed him. And then they did fealty; and both held their hands on the book, and the husband said the words, and both kissed the book."

This is also found in Fitzherbert, to whose cases, as well as those in the Book of Assises, Mr. Pike always has the reference.

"Judgment of the writ," says Thorpe, at p. 372, "for by his count he makes the donor to be his great-great-grandfather [*tresael*], and by the writ he makes him to be cousin, whereas in the writ he ought to be called *abavus* and not *consanguineus*. Kelshulle (Justice): When one passes above the great-grandfather [*besael*], there is no other form but to call the ancestors cousins; for King John, the great-great-grandfather [*tresael*] of the present King, is in Latin called cousin."

Observe the brevity of the French equivalents for our long, linked names of the remote ancestors above referred to. The Norman French of the Year Books is a compact language. One notices that the translation of it, in a page of thirty-six lines, regularly overruns the French page from three to five lines.

The chief part of the editor's learned introduction is devoted to an investigation of the word *Merchet:* "in England the payment of *Merchet* was . . . an unfailing indication of tenure in villenage." The meaning of this term has been much discussed in connection with certain unhandsome claims of lords as regards their female serfs. Mr. Pike regards the question as not yet ripe for an answer; but he is inclined to the opinion that *Merchet* is the equivalent of *for-mariage, foris maritagium*, a fine for the marriage of a person of either sex beyond the borders of his lord's land. "The early history of villenage in England, if written," says Mr. Pike, "would constitute the greater part of the history of the people of England." The history of villenage, as the editor elsewhere remarks, has yet to be written. It is the admirable publications of the Record Office and the Selden Society, and other like associations, that ar preparing the way for such tasks as this.

Upon two cases in the Michaelmas Term Mr. Pike makes the following interesting comments:

"Should any one desire to know what was regarded as fitting sustenance for an officer of the King's wardrobe, or other person of the rank of esquire in whose support the King was interested, the details can be found. The most usual form of pension was that of a corody in a monastery, and the full particulars of a corody claimed are set forth in the record. They include a suitable apartment or chamber (*camera*) for the pensioner and stabling for two horses, six loaves of one kind and three loaves of another kind daily throughout the year, with six flagons of monastery ale and two monastery dishes of porridge. On every flesh-day there were to be two monastery dishes of meat, and on every fish-day two monastery dishes of fish, apparently for the midday meal. On every flesh-day there were to be also two monastery dishes of meat for the evening meal, dinner, or supper (*cœna*), and on every fish-day (unless the pensioner happened to be fasting) two monastery dishes of fish. Every day there were to be allowed six wax candles for the pensioner's apartment. There were also to be allowed a basket of oats daily, and twelve loads of hay yearly, for his two horses. He was to have yearly six loads of straw for his apartment and twelve loads of wood (*buscæ*) for fuel. He was also to have every year one robe of the suit of the Prior's esquires for himself, and one robe of the suit of the Prior's grooms for his groom, as well as twenty shillings for shoes and other necessaries. The Prior, it is true, denied the King's right to exact these demands; but that fact does not in any way affect the statement as to the requirements of an esquire and the illustration which it affords of the mode of life at the period.

"With the sustenance fitting for an esquire we are afforded the means of comparing the sustenance fitting for the poor. An action of *Cessavit* was brought against the Abbot of Creake in respect of certain services, among which was that of supporting five poor persons at a particular place. He had to find for each of them one loaf of the weight of fifty *solidi* every day, with porridge and ale and a dish of meat or fish or other food, according to the day, between two of them, and half a dish to the fifth. Each of them was to have also a cloth tunic suitable to his condition every other year."

The Autobiography of Isaac Williams, B. D., Fellow and Tutor of Trinity College, Oxford. Edited by his brother-in-law, the Ven. Sir George Prevost, late Archdeacon of Gloucester. Longmans, Green & Co. 1892.

Dean Church wrote, in his 'Oxford Movement,' "Isaac Williams, if any man, represented in the movement the moderate and unobtrusive way of religious teaching." Yet no one of the Tractarians was thrust into an

uglier prominence than was he by his Tract 80, "Reserve in Communicating Religious Knowledge." As the controversy went on, this was interpreted as a plea for teaching Roman Catholic doctrines in the English Church, and Williams was punished by the loss of the Poetry Professorship in 1842. His 'Autobiography' is brief, but it is one of the most valuable contributions we have had to the history of the Tractarian Movement. Either his youth was without any promise of the seriousness of his maturity, or he delights to think so after the manner of the saints. The only passion which he names was for writing Latin verses—an injury, he confesses, to his English style. His meeting with the Kebles gave his life a turn to serious things. The influence of Thomas Keble on him seems to have been greater than John's. Under the latter's roof he made the acquaintance of Hurrell Froude, the Hotspur of the new departure. In what he writes of Froude there is the same disparity one always feels between the personal impression that he made and the arrogance and silliness displayed in his 'Remains.' In 1822 Keble was writing the poems of the 'Christian Year,' which was published in 1827. Neither Froude nor Williams cared for them. Froude opposed their publication, saying, "People will take Keble for a Methodist"—a potent sign how low religious feeling must have sunk in Anglican circles.

The most remarkable thing about Williams's book is the absence from it of all discussion or exposition of the Movement as an intellectual or spiritual thing. He has an algebraic term, "Church principles," to which he continually recurs. What those principles were he never offers to explain. As in every account of the Tractarians, we are impatient till Newman comes upon the scene; and, once arrived, he has no brother near his throne. Before Williams knew Newman he was advised to seek him out as an evangelical person and also warned against him as a liberal. Written in 1851 and revised in 1859, this little book effectually disposes in advance of Francis Newman's recent assault upon his brother as for many years a clandestine Romanist. It affords new evidence that Newman's dislike and dread of Rome were very great, while his clinging to the Anglican Church was very strong. All painful things attracted his ascetic disposition, and he might never have gone to Rome had his distaste for her been less. Williams's strangest judgment of him is that he united the "German rationalism" of Whately with the Churchism of Keble. Whately's rationalism was soundly English and not German; Pusey's beginnings had a German leaning that terrified many; Newman seems to have had no acquaintance with the German language or with German thought at first hand. The state of religion in Oxford, or of ecclesiastical observance, before the Tractarians made a difference, was never better indicated than by Williams's statement that he was "often nearly the only one in church listening to the usual hack preacher, who was reading some old sermon, not necessarily in connection with the Saint's day, earning his five guineas, in a manner unedifying and unprofitable to all but himself." One of the preachers was flattered by his attendance, but objected to the trouble of hunting up sermons for the day.

Williams's admiration and affection for Newman were very great, and the affection outlasted the ecclesiastical break between them, each writing to the other tenderly and each visiting the other; Newman's last visit to Williams being a few days before the latter's death in 1865. But the admiration seems to have been always qualified by some distrust. Newman's ascetic objections to the marriage of his friends troubled Williams, as did his suppression of his own domestic affections, and his tendency to daring speculations—a restlessness that nothing could abate. By far the most interesting part of Williams's book is that discussing the relation of the Tractarians to Newman and the Church of Rome. He makes out fourteen writers of the Tracts. It has been often said that it was the reaction from Evangelicalism that made Tractarians. But Newman was the only one who had been reared in Evangelical circles; what is more remarkable is that he was the only Tractarian who went to Rome. This is Williams's most interesting fact. It means that those who met Newman on any sort of equality had a saving distrust of him. None of them were carried away by the fascination which he exerted on them. The converts to Rome who preceded Newman thither and who followed him were younger men like Oakeley, Manning, Ward, and Faber. Ward's opposition to Newman was at first very strong; his conversion to his opinions was very sudden, and his advocacy of them unsatisfied with anything short of perfect logical consistency. What will please Anglicans most in this book is Newman's writing in 1863, that the English Church "upholds far more truth in England than any other form of religion would, and than the Catholic Roman Church could."

Some of the minor aspects of the book have an amusing turn. There are various incidents of the strange custom of preaching borrowed sermons: in America a fatal circumstance, in England taken for granted. Newman was responsible for the name of Williams's Tract 80, on reserve in religious teaching; and the name was the worst part of it. Williams says, "I think perhaps Newman himself made use of it to further his own secret inclinations towards the Church of Rome." Newman loses several of his divine attributes in the course of the narration, showing himself as one not without human weakness, vanity, ambition, touchiness, and pride. How the using of a little prayer-book held close to the eyes came to be a Tractarian sign that was spoken against was in this way: Thomas Keble used a little prayer-book at the daily service in order not to wear out the large parish book too fast. John Keble and Newman fell into the same custom for the same reason. All the young neophytes had to copy Newman in this respect as in others, racing through the service, for example, and writing of "Saint Charles," whom Cromwell beheaded, and "George the Good," presumably the third of that name and not "the first gentleman of Europe." Altogether there is more of disillusion in this little book than in any of its predecessors written with sympathy for the Tractarian Movement.

An Illustrated Dictionary to Xenophon's Anabasis, with groups of words etymologically related. By John Williams White and Morris H. Morgan. Boston: Ginn & Co. 1892.

It is refreshing to encounter a Greek schoolbook that is not translated or adapted from the German, and we are glad to learn that this 'Dictionary to Xenophon's Anabasis' "has been made from the 'Anabasis' itself, on the basis of an independent collection and examination of all the places where each word occurs." Another point which the editors emphasize is their "desire," in selecting English equivalents for the Greek, "to avoid that strange dialect which seems to have been devised by the Adversary for the express use of schools, and which has done much to make Greek (and Latin also) a dead language." This strange dialect is, of course due, not to the Adversary, but to the traditional use of obsolete words which have held their own in the schools after they had disappeared from the practical vocabulary of every day; and while no sensible person will object to making the English fresh and lively and to a certain extent modern—while no one will raise a finger to save "behoove"—still, it is possible to go too far. If one man uses "salaam" for "make obeisance," the next man will use "kow-tow," and justify it, too—in fact, justify it more readily than Messrs. White and Morgan can justify their rendering of δεσπότης by "Czar." As to that bugbear, the irregular verb, there is no use in quarrelling with the practice of making the vocabulary a key. But the trouble is to know when the help is to be withheld. If, unassisted by the grace of a dictionary, the beginner does not know that ἔλαβον is to be referred to λαμβάνω, by what inspiration is he to know that λαθεῖν is to be referred to λανθάνω? If ἀνέστην is put in, why is ἀνέκραγον left out? By the way, the lexicographers might have taken a hint from Autenrieth, and have printed in different characters the forms that do and those that do not occur. A Thelan might be allowed to say μόλωσιν. But who ever said βλώσκω except a dictionary-maker or some late snapper-up of curiosities? This God-forsaken Theban for whom the editors apologize says (vii., 3, 33), ἔστ' ἂν μόλωσιν; but ἔστε, to a dainty Attic, is almost as bad as μόλωσιν, and yet our lexicographers, who have something to say about ἀντίος, ἐξαπίνης, and σύν, have nothing to say about ἔστε for ἕως, ἐπεί for ἐπειδή, ὡς for ὥστε and for ὅπως; and the student is allowed to consider ἀμφί as good as περί, and ἀνά as common as κατά. Perhaps, however, it is as well not to prejudice the youthful mind against Xenophon, who is in great disfavor with the purists just now, and we will not quarrel with Messrs. White and Morgan for not imitating Holden, who follows Sauppe's system of noting the various kinds of wild honey that the Attic bee has stored in a hive which should have been consecrated to the nectar of Hymettus. Our lexicographers apologize for paying so much attention to "construction" in the several articles, but sometimes the attention has not been close enough: πρίν is badly stated, and διά with accusative 'through' is actually false.

From the time of the Messieurs de Port Royal and the 'Jardin des Racines Grecques,' teachers have been hoping marvels from the aid of etymology in enabling the students to master Greek, and some of the oldest generation of Greek scholars may dimly remember a certain volume of 'Greek Primitives' to be learned by heart. The results never come up to the expectation, and it would seem that Messrs. White and Morgan are too sanguine as to the practical service to be rendered by their groups of etymologies, among which there must be some individuals that will rouse the angry passions of those who consider an etymology a sacred thing. At all events, in a school-book like this, the semasiology ought to be clear, and the phonetics ought not to require an alembic. "Borrow" ought not to be put down under ἀπόφραξις, nor "hog" under ὅς, even if Skeat approves. And yet, after making all possible deductions, such as any one can make from any possible dictionary, it is but justice to say that the book is well cal-

culated to give life and interest to the study of the 'Anabasis,' and that the long articles on the antiquities, with their many illustrations, will lighten for learner and teacher alike their employment with a classic which shares the doom of Cæsar's 'Commentaries.'

The Robin Hood of Vermont. By Henry Hall. D. Appleton & Co. 1892. Pp. 207.

THIS book cannot lack readers. The time is ripe for another work on Ethan Allen. Former biographies, as by Sparks and Hugh Moore, are three-score years old, and based on less accurate information than is now accessible. Allen's own narrative, published in 1779, always obscured by his imperfect education, more and more needs illustrating and supplementing. It ran through a dozen editions within three decades, and will never grow old while men have regard for the courage of a hero or the fortitude of a martyr. As long ago as 1866, a copy of the *editio princeps* was eagerly bought for $56. Allen has a larger hold on popular interest because of a sort of resemblance to Abraham Lincoln on the humorous or (as some would say) the Jim Crow side. Both, too, used sportive sallies for a serious purpose. The racy remarks of both will live for ages in the mouths and memories of men.

This Life of Allen is enriched to some extent from archives of which former biographers made no use, as, the Journal and expense-account of Capt. Mott and the letter of Wedderburn, which we owe to the London research of B. F. Stevens. Hence, and in other ways, certain side-lights are thrown on the four cardinal features of Allen's career. These were his taking of Ticonderoga; his captivity; his struggle for independence of New York; and his diplomatic dallying with Canada. Recognition of his noble service at each of these crises moved Green Mountaineers to set up one statue over his grave, another in the Vermont State-house, and another in the Rotunda at Washington. The last-named is of really national celebrity because few American children grow up without learning his summons, in the name of Jehovah, to the head of the garrison at "Ty." Mr. Hall's style is terse, usually clear, and he gives a more vivid picture of scenes in Allen's career by grouping around them contemporary events. Familiar facts, under his pen, assume an unexpected freshness, and a reader becomes reluctant to lay down the volume till he reaches the last chapter.

After all, it is greatly to be regretted that Mr. Hall died while in the midst of his labor of love, for his work needed much more elaboration and must be pronounced both superficial and inaccurate. Capt. Mott is shown to have been the Moltke of the expedition against Ticonderoga, but his name appears as *Nott* in four different places, and that in such a context as to suggest another man. This misprint or blunder could never have escaped Mr. Hall's eye. In fact, however, this Nott must mislead many readers almost as much as the omission of *not* in printing the seventh commandment did. In the Journal of Mott there is a misprint of "for" instead of "from," not likely to be suspected, but which renders a whole paragraph totally obscure. "From our people" is supplanted by "*for* our people," p. 64. Mr. Hall has a spirited page on Allen's "alarum" which rallied his men, but not a word as to the boats, "the be-all and the end-all," which, in Allen's words, "were procured with the utmost difficulty." Had he put his last hand to the work, Mr. Hall would have made it manifest, as Goodhue and Chittenden have done, how nearly that difficulty proved insurmountable, and how adroitly it was overcome, though not till the last minutes of the eleventh hour.

But for the capture of Ticonderoga, it is not likely that the British would have been driven out of Boston. This Mr. Hall would have demonstrated by further research. The Colonial Records of Connecticut would have shown small arms and lead, sent from there to Washington, "at his earnest request," to have been among the spoils which Allen had taken. Mr. Hall would have set before his readers the army which blockaded Boston destitute of siege guns till fifty-nine pieces were secured from the same spoils. He would have quoted Washington's words to Knox, who was sent to Ticonderoga for these cannon: "The want is so great that no trouble or expense must be spared to obtain them with the utmost despatch." He would have added that, in a week after they were in position, Boston became untenable and that spoils valued at £300,000 were taken by an outlay of £520 15s 8¾d. In many other ways, had Mr. Hall survived, we should have been taught to appreciate Allen's exploits much better than is now in our power. In various details he would have caught Bancroft and even John Fiske napping. But, in point of fact, the deficiencies in his own work cannot be numbered. Among minor ones we note a stumble on the threshold. Allen's birth-place is nowhere mentioned. This omission is the more noteworthy because it is a point on which authorities differ. Hinman and Allibone say Allen was born in Roxbury; Dr. Dwight says Salisbury; Allen's Biographical Dictionary says Woodbury; and all four are wrong. Kilbourne has found the record of Allen's birth as at Litchfield, on the town-records there. Errors as to Allen's age were corrected by Mr. Hall.

Washington, who met Allen but once, remarked in him "an original something which commands admiration." We all share that feeling, which deepens at every page we read of his own writings, and we honor Mr. Hall's endeavor to heighten and diffuse that feeling.

The Apodidæ: A Morphological Study. By Henry Meyners Bernard. [Nature Series.] Macmillan & Co. 1892. 8vo, pp. 316, illustrated.

THROUGHOUT this volume, determination to establish particular opinions is so prominent that readers can hardly avoid questioning every statement. Evidence of what may be prejudice and partiality is met with everywhere, and we lay the work aside with the feeling that it must be done again before we shall know what estimate to place on the author's personal equation, how to value his interpretations of facts, or whether his conclusions are worthy of adoption. At the outset it is stated that the purpose of the book is to prove the Apodidæ a transition form, a connecting link, between the other Crustacea and the Annelida. The statement was hardly necessary, for the purpose is sufficiently manifest. The book contains a very interesting presentation of the author's views; it would be more satisfactory if it were more convincing. It is decided that Apus is a modified annelid, and, therefore, a primitive crustacean; that Limulus and Apus have developed from the same "bent crustacean-annelid"; that the Trilobitæ had the same origin, and are nothing but specialized carnivorous annelids; that Limulus, Eurypterus, and Pterygotus are specialized forms of the early trilobites; and that the Ostracoda are derived from the trilobites, while the Cirripedia and Copepoda were from a larval, and the Phyllopoda and Malacostraca from an adult, form of Apodidæ. A deal of manipulation is required to bring the "bent annelids," the Trilobitæ, the Eurypteridæ, the Xiphosuridæ and the Apodidæ and other recent Crustacea into such close relationships, but Mr. Bernard has accomplished it, to his own satisfaction at least.

BOOKS OF THE WEEK.

Alarcón, P. A. de. The Child of the Ball. Cassell. 50 cents.
Arnold, Matthew. A French Eton. Macmillan. $1.75.
Austen, Jane. Lady Susan. Boston: Roberts Bros. $1.25.
Bazán, Emilia P. The Swan of Vilamorta. Cassell. 50c.
Beljame, A. Enoch Arden. Poème traduit en prose française. Paris: Hachette.
Beljame, A. Enoch Arden. Texte anglais, avec notes grammaticales et littéraires. Paris: Hachette.
Bernard, J. H. Kant's Kritik of Judgment. Macmillan. $3.50.
Bigelow, Poultney. Paddles and Politics down the Danube. C. L. Webster & Co. 75 cents.
Bluntschli, J. K. The Theory of the State. 2d ed. Oxford: Clarendon Press; New York: Macmillan. $3.
Brewster, H. P., and Humphrey, G. H. England and its Rulers. Chicago: S. C. Griggs & Co. $1.50.
Buxton, Mrs. Sydney. Side Lights upon Bible History. Macmillan. $1.50.
Clarke, Clara S. The Poet's Audience, and Delilah. Cassell. $1.
Darenberg, G. Le Choléra: ses Causes, Moyens de s'en Préserver. Paris: Reuff & Cie.
Davis, Mrs. Rebecca Harding. Silhouettes of American Life. Scribners. $1.
Essays by Sainte-Beuve. London: W. Scott; New York: A. Lovell & Co. 50 cents.
Findlay, Rev. G. G. The Epistle to the Ephesians. [Expositor's Bible.] Armstrong. $1 50.
Garland, Hamlin. A Spoil of Office. Boston: *Arena* Publishing Co. 50 cents.
Giffen, Robert. The Case against Bimetallism. London: George Bell & Sons; New York: Macmillan. $2.
Heine, H. Italian Travel Sketches. London: W. Scott; New York: A. Lovell & Co. 50 cents.
Hocking, Joseph. Zillah: A Romance. Ward, Lock, Bowden & Co.
Jagemann, Prof. H. C. G. von. Elements of German Syntax. Henry Holt & Co. 80 cents.
James, G. F. Handbook of University Extension. No. I. Philadelphia: University Extension Society.
Johnson, Amy. Sunshine. [Nature's Story Books.] Macmillan. $1.75.
Kennard, Mrs. Edward. Wedded to Sport. National Book Co.
Leaf, W. A Companion to the Iliad for English Readers. Macmillan. $1.60.
Leland, C. G. Leather Work. London: Whittaker; New York: Macmillan. $1.50.
Lewis, Mrs. Harriet. Beatrix Rohan. Robert Bonner's Sons. $1.
Macquoid, Katherine S. Berris. National Book Co.
Marryat, Florence. The Nobler Sex. Hovendon Co. $1.
Mayflower Tales. John A. Taylor & Co. 30 cents.
McCay, Miss S. C. A Modern Quixote: A Story of Southern Life. Chicago: Morrill, Higgins & Co. 50 cents.
Merrill, E. A. Electric Lighting: Specifications for the Use of Engineers and Architects. W. J. Johnston Co. $1.50.
Michel, Emile. Les Van de Velde. [Les Artistes Célèbres.] Paris: *L'Art*; New York: Macmillan.
Miller, Lucian. Greek and Roman Versification. Boston: Allyn & Bacon. 75 cents.
Needell, Mrs. J. H. The Story of Philip Methuen. M. J. Ivers & Co. 25 cents.
Oliphant, Mrs. Diana: the History of a Great Mistake. U. S. Book Co. $1.25.
Payn, James. A Modern Dick Whittington. John A. Taylor & Co. 50 cents.
Reinach, Salomon. Antiquités du Bosphore Cimmérien. Paris: Firmin-Didot & Cie.
Riddell, Mrs. J. H. A Mad Tour. U. S. Book Co. $1.25.
Rolleston, T. W. Selections from Plato. London: W. Scott; New York: A. Lovell & Co. 50 cents.
Salter, W. M. First Steps in Philosophy. Chicago: Charles H. Kerr & Co.
Sanborn, E. W. People at Pisgah. Appletons.
Schoenhof, J. The Economy of High Wages. Putnams. $1.50.
Shields, T. E. Index Omnium. Boston: Joseph Knight Co.
Strecker, Karl. Der Sang der Mönchgut. Stralsund: Bremer's Verlags- Buchhandlung.
Swank, J. M. History of the Manufacture of Iron in all Ages, etc. New ed. Philadelphia: American Iron and Steel Association. $7.50.
Tenger, Mariam. The Hungarian Girl. Robert Bonner's Sons. $1.
The American Yacht List for 1892. Thomas Manning. $10.

The *Monist*. Vol. 2. Chicago: *Open Court* Publishing Co.
The Professor, and Other Poems. London: Kegan Paul, Trench, Trübner & Co.
The Story-Teller. No. 1. Boston: W. B. Clarke & Co. $1.
Theuriet, André. A Young Man of the Period. Chicago: Laird & Lee. 50 cents.
Thomson, J. A. The Study of Animal Life. Scribners. $1.50.
Underhill, John. "The Athenian Oracle": a Selection. London: W. Scott; New York: A. Lovell & Co. 50 cents.
Warden, Florence. Ralph Ryder of Brent. National Book Co. $1.25.
War under Water. Cassell. 50 cents.
Whitney, H. M. The Tourist's Guide through the Hawaiian Islands. Honolulu: Hawaiian *Gazette* Co.
Williams, T. C. Principles of the Law of Real Property. 17th ed. London: Sweet & Maxwell; Boston: Boston Book Co. $5.
Wilson, J. G. Memorial History of the City of New York. Vol. II. New York History Co.

HENRY HOLT & COMPANY'S

EDUCATIONAL ANNOUNCEMENTS

Include—The long-expected Physics by Prof. Geo. F. Barker *of the University of Pennsylvania (about Oct. 1), which will present Physics as distinctively the science of energy, and will have the benefit of all the numerous recent advances in physical science, and a large and almost entirely new set of illustrations. It will consist of about 800 8vo pages and be included in the American Science Series—Advanced Course.* "Representative English Literature," *Selections with Historical Connections by* Henry S. Pancoast *of Philadelphia, the University Extension lecturer. (Large 12mo, about 500 pp., about Nov. 1.) A second volume of the late* Bernhard Ten Brink's Early English Literature *(12mo, about 300 pp., about Oct. 1), Short Histories of German and French Literature, entitled* German Literature in its Chief Epochs, *by* Prof. Kuno Franke *of Harvard (in English), and* Histoire de la Littérature Français, *by* Prof. Alcée Fortier *of the Tulane University of Louisiana (in French).* Materials for German Prose Composition, *by* Prof. Von Jagemann *of Harvard (about Oct. 1).* A Minimum French Grammar, *designed as a help to quick reading and containing many selections, by* Prof. E. S. Joynes *of the South Carolina College (12mo, under 200 pp., about Dec. 1).* Contes de Daudet, *edited by* Prof. A. G. Cameron *of Yale (about 250 12mo pp.), and other French and German texts with competent editors.* A History of Modern Philosophy *from Nicholas of Cusa to the present time, by* Prof. Richard Falkenberg *of Erlangen, translated under the author's supervision by* Prof. A. C. Armstrong *of Wesleyan, Ct. (8vo, about 550 pp., about Feb. 1, '95). In Dr. Sneath's Series of Modern Philosophers, 12mo,* Hume, *by* Prof. Aikens *of Trinity (S. C.)—and* Hegel, *by* Prof. Royce *of Harvard.* Greek Lessons, *by* Prof. Thos. D. Goodell *of Yale (16mo, about 370 pp., about Sept. 15), being an enlargement of his Greek in English that brings the pupil to reading Xenophon, and a companion Latin book,* The Latin in English, *by* Prof. Harry Pratt Judson *of the University of Chicago (16mo).*

READY THIS WEEK:

Crozier's Dictionary of Botanical Terms. By A. A. Crozier, M.S., Secretary of the American Pomological Society. 8vo, 202 pages.

This work attempts to define in alphabetical order all terms, both technical and popular, that are applied to plants, and to indicate those obsolete or obsolescent, and of several synonyms the one mos approved.

HENRY HOLT & COMPANY,
29 West 23d Street, N. Y.

Crosby's Vitalized Phosphites.

The *only* Brain and Nerve Food from the phosphoid principle of the *ox brain* and embryo of wheat. Largely used, with best results, for *preventing*, as well as curing, nervous breakdown. It restores weakened mental and physical vigor. It is a vital phosphite, not a laboratory phosphate.

For thirty years endorsed by leading physicians. Formula on the label. Pamphlet with full information free. Druggists or by mail. $1.00.

F. Crosby Co.,
56 W. 25th St., N. Y.

Government Baking Powder Tests.

UNITED STATES and Canadian Government food investigations show the Royal Baking Powder a cream of tartar powder superior to all others in leavening strength.

Statements by other manufacturers to the contrary have been declared by the official authorities falsifications of the official reports.

APPLETONS' LIBRARY LISTS should be in the hands of every book-buyer in the land. Graded Lists for School Libraries, and Topical Lists for teachers', students', and readers' reference.

SEND FOR THEM.

35 Pine Street, New York City.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 8, 1892.

The Week.

PRESIDENT HARRISON has on many occasions shown himself a shrewd and facile writer on public subjects, but his skill and judgment surely forsook him in the preparation of the diffuse and labored document which he gave out on Tuesday as his letter of acceptance. Aware of the immense unpopularity of the McKinley Bill in this country, he tries to cut his personal fortunes loose from it in two ways. First, he dwells upon "the reciprocity policy," the small results of which up to date he explains by saying that "we are only beginning to realize its benefits." He rightly, if tardily, gives Mr. Blaine the main credit for forcing the obnoxious principle upon his party. The President himself is the most distinguished convert of his late Secretary of State. What he really thought of reciprocity, and continued to think of it until after the disasters of 1890, was frankly revealed in his letter to the Senate of June 19, 1890, accompanying Mr. Blaine's proposals, and throwing most unmistakable cold water upon them. On that occasion he said: "It will certainly be time enough for us to consider whether we must cheapen the cost of production by cheapening labor in order to gain access to the South American markets, when we have fairly tried the effect of established and reliable steam communication and of convenient methods of money exchanges." There spoke the real Harrison and real protectionist, just as the same interesting combination speaks further on in his letter of acceptance, where he rails in the good old fashion at "the markets of the world," stands aghast at that "competition that would destroy the comfort and independence of our people," and chuckles over the closing of "foreign tin-plate mills and plush factories." Whatever may be said of the Republican party at large, it is clear that, with the President, reciprocity is, indeed, a "sham"—a thing in which he has no personal belief, and which he would make use of to deceive the people and obscure the political issue.

Most amazing of all is his attempt to run away bodily from the McKinley Bill. He says: "The Convention did not adopt a schedule, but a principle that is to control all tariff schedules." If Gov. McKinley makes any more speeches for the President after that flat repudiation of his masterpiece, he will be as magnanimous and long-suffering as the people must be who listen to his vain repetitions. Mr. Harrison seems to think it is still 1888. Then he could talk of not being committed to any "schedules," and of his party being ready to "revise rates"; but now that is four years behind the times. The schedules are made, the rates are revised, and the result is a tariff law of which the vast majority of the people have emphatically shown their condemnation. Not committed to a schedule? Still "differences of opinion among protectionists as to the rate upon particular articles"? What, then, becomes of that famous appeal to business men to continue the Republicans in power so as to secure a "permanent" tariff and "stable" conditions? According to the President there is just as much likelihood of a new tariff upheaval within two years, if his party is successful in the election, as there was four years ago.

On the Force Bill issue three courses were open to President Harrison. He could reaffirm his former avowed opinions, and call, as he did in his letter four years ago and in his messages to Congress, for a thorough-going Federal election law; he could admit that he had changed his mind in the face of the emphatic disapproval of the country; or he could trim. Needless to say, he has trimmed. And the usual fate of trimmers awaits him: his disingenuous allusions to a "non-partisan commission," and to the "new political movements" in the South, will not, on the one hand, reassure the South, nor, on the other, satisfy those Republicans in the North who wanted a flat-footed declaration in favor of Federal control of elections. On this subject he accurately represents the uncertain and shifting position and inconsistent pretensions of his party. Since the platforms were adopted, the Force Bill issue has come to have a prominence which is destructive of Republican hopes of electoral votes in the South; the President's letter serves only to accentuate that issue and the damage it is certain to do his party. The letter as a whole gives the impression of a "groggy" prize-fighter, who strikes wildly but weakly in all directions without once hitting his adversary. It will probably remain for all time unequalled in its dreary length, and we certainly hope that no candidate for the Presidency will ever again put forth an appeal to the American people containing so many passages which smack of the unscrupulous political haranguer.

The circular-letter sent out by the Treasury Department, with the sanction of the President, establishing a quarantine period of twenty days for all ships bringing immigrants to this country, has been approved by the public, but it cannot be affirmed that it has any legal effect. Even by its own terms it does not supersede any State laws or regulations, but makes an exception of them in all cases. In other words, if the Quarantine authorities of this port find that an immigrant vessel is free from disease or contagion, and accordingly issue a permit to land her passengers in less than twenty days, the Treasury circular has nothing to say to the contrary. Any controversy between Federal and State authority on this subject is thus avoided, and wisely so. It would add much to the embarrassment of the situation if there were room for such a dispute. Dr. Jenkins has said that he shall administer the State laws on the subject of quarantine independently, and if he finds a ship free from disease and from danger he shall pass her. In taking this position he is not only within his right, but within the terms of the circular itself.

There is a pretty general belief prevailing throughout the country that immigration ought to be checked independently of the cholera, and this sentiment will sustain the twenty-day regulation in the same way that it would sustain a law restricting immigration. But it must not be supposed that immigration can be stopped without producing effects on business in general. Ships cannot run in the same number as before unless they can carry immigrants, and as ocean freights cannot be moved without ships, there must be a curtailment of both imports and exports. A curtailment of imports will cause a loss of revenue to the Government and will naturally lead to some rise in the prices of the imported articles. It will be accompanied by some fall in the prices of exported articles. Indeed, such a fall has already been observed in the produce markets, due to the disarrangement which the cholera had produced abroad. That effect will now be intensified. Railways will lose both freights and passenger fares to some extent. People will economize, and this will cause some shrinkage of business, so that by and by there may be as strong pressure on the Government to cancel the anti-immigration circular as there was to issue it; provided, of course, the disease appears to be diminishing abroad. In other words, if the circular is an evil, a train of causes will soon be in motion to remove it. Meanwhile, we all know that the cholera is now controllable to a degree quite unknown in any former visitation. We have, therefore, every reason to expect that its ravages will diminish instead of increase in Europe, and that with the help of approaching cold weather it will soon disappear altogether. Whether it will gain lodgment on our shores no one can say with certainty. We think that the chances are against such an eventuality.

The action of the bolting Republicans in the Nevada State Convention on Thursday

appears to make it certain that the three electoral votes of the State will be lost to Harrison and Reid in November. The bolters comprised two-thirds of the delegates. They refused to nominate Harrison electors, and adopted resolutions condemning the Republicans of the Eastern States and Harrison's Administration for failing to enact laws in favor of free silver coinage. They also endorsed the Weaver Presidential electors, two of whom are Republicans and one a Democrat, and all of whom are pledged to vote against both Cleveland and Harrison. The free-silver party have a thorough organization throughout the State, and it is now believed to be certain that they will carry the State for their electors and all other candidates by a large majority. This fact will be a cause for serious anxiety to the National Republican managers, for the three votes of Nevada combined with the four or five which the Republicans will lose in Michigan make a dangerous break in their column of "sure" States.

Now that the protectionist press has fairly committed itself to the position that the McKinley Law has raised wages, it will have a lively fight on its hands. The Peck business is turning out badly, and the views of the workmen—who presumptively know best—as to their wages are being presented on every hand. An interesting summary of these views is made public by Mr. John De Witt Warner in the last number of *Tariff Reform*. Early in July of this year the *World* published a list of some 500 cases of reduction of wages, which were not veiled under the convenient obscurity guaranteed by the Bureau of Labor method of obtaining statistics, but were stated with details of name and place. The publication of this list threw the protectionists into dire confusion, and they attempted to break its force by asserting that in a few cases reductions in wages were offset by improvements in processes and machinery. An active distribution of circulars addressed to protected manufacturers took place, begging for reports of increases of wages with which to meet the *World's* statistics. The most earnest appeals and desperate exertions at last resulted in a beggarly array of twenty-eight instances where wages in protected industries had been increased, and the *American Economist* was forced to put these forth as the best answer it could make to the overwhelming figures against it.

This was just the opportunity for which tariff-reformers had been waiting. The *Economist* was compelled by the exigencies of the situation to give names and places and rates of increase of wages, and the tariff-reformers at once began an investigation of every one of the twenty-eight cases published by the *Economist*. The results of these investigations are now summed up by Mr. Warner. His summary is dismal reading for protectionists. In many of the establishments alleging increased wages, when the allegation was shown to the employees it was received with the exclamation, "What a lie!" In a number of cases wages had been maintained by strikes, in a few they had been advanced on account of strikes, in several the wages of some of the hands had been increased and the wages of others reduced, and in some cases there had been a reduction all around, instead of an increase. The employees even of the benevolent and blatant Dolge of Dolgeville, who publishes a Dolgeville paper devoted to the propagation of the theory that he does business purely for love of the laboring man, seem to find great difficulty in discovering any increase in their wages, although some of them complain of reductions. Altogether Mr. Warner exposes the *Economist's* statements most completely, and those who desire to learn the workmen's opinion of the protectionist claims will do well to look at this issue of *Tariff Reform*.

The Secretary of the Treasury, Mr. Foster, seems to have displayed his usual facility in muddling any question into which "labor" enters, in the matter of the new Post-office building at Newark. In accordance with the general desire, the contract called for the use of Belleville sandstone, but a few weeks ago Mr. Foster authorized a change to Indiana bluestone. Among other citizens of Newark who wanted the Belleville stone used was ex-Congressman Halsey. Congressman English, in a recent speech, alleged that he called upon Secretary Foster in reference to the stone to be used, and that the latter said to him: "How do you expect us to do this for you when Mr. Halsey voted against us at Minneapolis?" However that may have been, the reasons now advanced by the Secretary for his action are worth attention. As explained in the *Tribune*, "the contractors could not procure Belleville stone to be worked by union men." Therefore the change to Indiana stone was made "to give Newark a post-office as early as possible, and to benefit union workingmen who were on strike." Now, if this is the principle upon which the Administration is to be run, it is evident that its applications have only begun. If the *Tribune* must be unionized and no Government contracts in Newark allowed to be defiled by the touch of a non-union laborer, why not apply the same rules to the contracts of the Carnegie Company? "Union workingmen on strike" are in great numbers at Homestead, and in the mills are non-union men making armor-plate for the Government. We advise the Amalgamated Association to notify the President and Mr. Reid that this must stop, and that if they really are the friends of "regular" workingmen, they will see to it that not a pound of steel plate is accepted from the Carnegies until "genuine laboring men" are allowed to make it.

A public document entitled "Gold and Silver," just issued by the United States Geological Survey, presents again the statistics of production of those two metals for the year 1890, and also for previous years. Two facts are especially noticeable in this report—the remarkably uniform production of gold, and the rapid increase in the production of silver. The gold production for ten years past has varied but little from $32,000,000 per annum, while that of silver has increased in the same time from $46,000,000 to $70,000,000 per annum. In 1869, the year of the completion of the first railway to the Pacific, the production of silver in the United States was only $12,000,000. In the following year the Kansas Pacific Railway was completed to Colorado, and the year's production of silver rose to $16,000,000. From that time to the present, railway building in the mountain region and silver production have gone hand in hand until the present enormous output has been reached. That the two facts are connected together as cause and effect is very plain. Railway building has enormously cheapened the cost of extracting all ores. New inventions and discoveries in metallurgy have worked in the same way. Now, if anybody is looking for a cause of the great decline in silver since 1870, he can find it in the enormous increase in the amount coming upon the world's market. If we take a wider range of observation, we find the same causes and the same results at work in Australia and in other countries. In 1870 the world's annual production of silver was only $64,000,000. In 1890 it was $171,000,000, as nearly as can be ascertained. In the former year silver was 34 per cent. of the production of the precious metals. It is now between 59 and 60 per cent., nor is there any sign as yet of a change in this ratio of production. Evidently the decline in the price of silver will continue until it passes out of the category of the precious metals altogether, if it is not already out.

That free competition of labor is the proper correlative of trades-unions has witness in English legislation. On the same day (June 29, 1871) that the legal status of trades-unions was recognized by act of Parliament, a law was passed for the more certain punishment of attempts to limit the freedom of labor. In France, however, another course was taken. No sooner had trades-unions received legal sanction by the Act of March 21, 1884, than the effort was made to repeal the three articles of the Penal Code which threw safeguards around the right to work. Two of these provided punishment for violence or fraud in restraint of the freedom of labor, and the third for what we know as boycotting. All three were

promptly repealed by the Chamber, but the Senate has so far refused to concur except in the repeal of the last. Even out of that, mischief has grown, as is seen by a curious decision just given by the Supreme Court. A certain workman in the Department of Isère had abandoned his union and was unable to secure work because it at once proceeded to boycott any employer who hired him. He sued the union for damages, but was beaten in the two lower courts on the express ground that the code no longer recognized boycotting as a crime. But the Supreme Court has made the ingenious distinction that boycotting is legal "when its object is defence of a union's interests," but not so "when it aims to force an employer to dismiss a workman because he has left the organization and refuses to return to it." On the strength of this distinction, the decision of the lower courts was reversed. This is apparently straining a point, but, if so, it shows the well-grounded fear of the court that society could not endure an unchecked tyranny, whether it were that of Government or of labor-unions.

The future of the French Republic seems now to be at least as well assured as that of any Continental Power. The elections of July 31 were perhaps of historical importance, for they were the first into which no question of the form of government entered. They were exclusively Republican. Party lines were no longer drawn, with Republicans on one side and Monarchists on the other. There were perhaps not ten candidates who did not, explicitly or implicitly, express their assent to the present order of things. The representatives of the various pretenders to the throne of France have not been slow to see the drift of events, and to act accordingly. Even before the elections, the party of the Whites of Spain had been thrown into disorder by the Pope's declarations in favor of the Republic, and by the withdrawal of some such members as M. Maurice d'Andigné. Don Carlos, their chief, has now himself yielded to the desires of the Holy Father, and gives, as he says, "a new proof of his devotion to the Holy See" by cancelling the powers of the Prince de Valori, who has been for a number of years his representative in France.

The Orleanists appear to be moved by the same considerations that have swayed the Whites, and to be following not very far behind them. On August 11 the Marquis de Breteuil, whose relations to the Comte de Paris have been those of close friendship, and who has known all his plans and hopes, sent a letter of resignation to his constituents in Argelès. This letter is noteworthy for its dignity and frankness. The Holy Father, says M. de Breteuil, has withdrawn publicly his confidence from the Royalist party, and adjured them to renounce their political opinions for the good of France. For himself, then, he bows respectfully before the counsels of the Sovereign Pontiff, but they have changed the state of things so much that the new situation demands new men. The chiefs of the Monarchist Right must be free from all suspicion of having profited by their sudden conversion. To inspire confidence in universal suffrage they must retire from public life, and leave to others the task of maintaining conservative interests in the Republic. Even the Imperialists accept the Republic in words. They say they would accept it fully and without reserve if it could only be changed a little to suit them, and made Bonapartist and plebiscitary. They kept the Napoleonic feast this year, the little remnant of them, very much as mourners might gather to a banquet of funeral baked meats. A certain M. Engerand, Deputy from Caen, addressed them in a long speech in which he pointed out the sure path to triumphant success. All that the party has to do is to add to its late Boulangism socialism, and to socialism the anti-Semitic ardors of M. Édouard Drumont. Drumont and Mores should be, in fact, its leaders. It is evident that the Republic will take no detriment from such midsummer madness as this.

Further reports in regard to the practical working of the German laws of compulsory insurance for workingmen show how far from acceptable they are to employers and laborers alike. Especially burdensome and irritating are they felt to be in the agricultural regions. Farm laborers have never had to pay any direct taxes, and now are tempted to consider the weekly insurance stamps as an exaction. Many of them tear up their official insurance cards, and more obstinately refuse to pay their weekly quota. Where wages are low, the employing farmer is often obliged to pay for his workmen, and where wages are high, he often makes them pay his own proportion. The natural result is an increased friction between employers and employed, instead of that happy-family condition of affairs which was expected to follow the paternal laws in question. Moreover, the business is an expensive one in its principle and wasteful in its administration. A large farmer of the Rhine valley sends his experience in the matter of insurance against sickness to an agricultural paper. In his employ are twenty-two families, besides extra help at planting and harvest. His total expenses for sickness, covering men, women, and children, used to be $75 a year; now he is obliged to pay into the fund for insurance against sickness no less than $350 yearly. He adds that his employees are greatly discontented, and gives it as his opinion that "the burdens created by the recent social laws are destined to bring about serious embarrassments in the relations of agriculturists with their workmen, and to have a pernicious political effect."

For more than two months public attention and the time of Congress in Brazil were taken up with a novel bill for "aiding industry." On May 12 a committee, appointed for the purpose by the Minister of Finance, made a report on the best methods of relieving the general depression in business. It advocated an extension of the protective principle in tariff legislation, but concluded that that way of putting money into the pockets of a favored few was too slow, and so recommended a grant of money outright to embarrassed manufacturers and speculators from the national Treasury. In accordance with the report, a bill was introduced in Congress for the issue of $50,000,000 in 5 per cent. bonds "in aid of trade and industry," the said bonds to be doled out to those who could show that their business was in a bad way, and so entitled to national aid. The bill was greeted with immense popular enthusiasm, mass-meetings being held in great numbers to endorse it, and great demonstrations of workingmen being got up at which the threat was freely made that if the bill did not pass, there would be an insurrection. The papers were full of the affair, and several of them approved the plan. Many members of Congress were outspoken in its favor, and even the Minister of Finance gave it a qualified endorsement. For a time it seemed certain that the scheme would become law.

But serious opposition arose. The solid business houses and manufacturing concerns concluded that they had no interest in being taxed for the benefit of shaky enterprises, and a petition against the bill was laid before Congress, signed by 500 of the most reputable firms in Rio de Janeiro. About the same time the foreign banking-houses which were carrying Brazilian securities began to telegraph the Government that if it did not quit fooling with such insane laws, Brazilian credit would be knocked to pieces in Europe. This action naturally aroused a vast deal of patriotic indignation among the promoters of the scheme, who at once began to rage furiously, in a way not unfamiliar in our own land, against "foreign intruders," and to ask if the Government was prepared to take its orders from the "Jews of London." However, the authorities took fright, and when the bill came to a vote on July 22, it was beaten by a large majority. It seems a pity that such a naïve and direct application of the great principles of protection was not allowed to be made for the instruction of mankind. We believe it to be the fact, however, that in this country the public is now pretty generally aware that protective taxes which really protect are as undisguised a gift to the favored manufactures as would be a direct bounty voted them.

CHOLERA AND QUARANTINE.

A TIMELY and reassuring article on the history of the several epidemics of cholera in this country, and of the efficiency of the New York Quarantine, appears in the last number of the NewYork *Medical Journal*, from the pen of Dr. S. T. Armstrong. The drift of it is that, with the better understanding of the nature of the disease and of the methods by which it is propagated, together with the great improvement in public sanitation and in the equipment of Quarantine, "the existing conditions are favorable for the possibility of adding 1892 to the credit side of the administrative account of the Quarantine at the port of New York"—that is, for excluding cholera from the city.

Dr. Armstrong takes up the record for ten cholera years, and shows that in four of them the epidemic "entered the country in part by the New York Quarantine, though in each of these years there was an almost contemporary introduction of the disease via Canada or New Orleans." In 1866 the local Quarantine was solely at fault, but in five years, viz, 1855, 1856, 1867, 1873, and 1887, it was entirely successful in preventing the cholera from getting on land, although in each of them the disease was on shipboard in the harbor. In other words, in five out of the last six appearances of cholera in New York Bay, the measures adopted by the Health Officer of the port have been adequate to protect the city perfectly. This is the most encouraging feature of the situation, inasmuch as it shows an increasing efficiency. In fact, as Dr. Armstrong points out, the facilities and equipment of the Quarantine establishment are now superior to any we have ever had before, and he very forcibly argues that if the cholera could be kept out in 1887, by "the meagre, unscientific, and inadequate appliances" of that year, the arrest of the disease this year, under the greatly improved conditions, will depend simply "upon the vigilance and capability of the Quarantine officials."

One very important point made in Dr. Armstrong's article is, that in several of the epidemics the outbreak occurred as the result of infection brought into the country in the preceding fall and winter. Thus, in 1832, when there were 3,512 deaths from cholera in New York city, the first known case was that of a man who entered the country by way of Canada in 1831. Similarly, in 1866, the disease broke out in the city on May 1, while the first infected ship from abroad was still under detention at Quarantine. It seems, however, that a steamship had reached the harbor on November 2, 1865, on which sixty cases of cholera had occurred on the passage, forty-three more cases appearing during her stay at Quarantine. Three other infected vessels came later in the winter of the same year, and it must have been from one of them that the germs found lodgment in the city. As regards the epidemic of 1849, it is stated that there were deaths from cholera in New York during the previous winter, the victims being immigrants who "*broke quarantine.*" This was a literal fact, as it is on record that more than one hundred immigrants confined in the Staten Island Quarantine station "scaled the walls and fled to the city"! No wonder that the worst epidemic in the city's history followed, no less than 5,071 deaths having occurred as the result of such fearful mismanagement.

It is only necessary to recall the blundering and ignorance of those days, to see how inconclusive is the argument of those who reason that things will go in 1892 as they did in 1849 and 1866. These despondent and alarmed persons forget, in the first place, how things went in 1873 and 1887, and they overlook, besides, the great improvements made at Quarantine since even the last-mentioned year, and above all the spread of better sanitary methods among the people generally. It was pointed out at the time of the great and prolonged heat last July, that the mortality from sunstroke was far less than it had been at similar times fifteen and twenty years ago. This was rightly attributed to a better popular knowledge of hygienic principles, and there is no doubt that the same thing would have its effect in staying the ravages of cholera should it actually get a foothold in the city. If it is said that there are larger masses of ignorant population than ever before, that is no reason why the rest of the city should be panic-stricken. Americans and Europeans live in Asiatic cities where cholera is endemic, and yet they have no fear that they will not be able to protect themselves. Furthermore, it is an undoubted fact that the poorer quarters of this city are subject to a better sanitary and medical inspection than ever before, and that the chances would be as good for isolating and preventing the spread of the disease here as they have been shown to be, so far, in London and Liverpool and Glasgow.

We believe that warning against needless panic is less called for now than a week ago. Those hysterical individuals, some editors among them, who then seemed to think it a marvel that they were still alive, have recovered their equanimity. Now that it is well settled that the infection of cholera is received only in a definite method, against which it is possible to adopt almost certainly protective measures, the obvious thing to do is not incontinently to fall sick of the disease before it arrives, and to make sure that you do not fall sick of it after it arrives.

THE PRACTICAL TARIFF ISSUE.

IT has for many years been the habit of protectionists to warn the American people that the Democratic party was determined to destroy their industries and reduce them to starvation. While there may have been persons of sufficient simplicity to accept this representation as true, it has generally been treated with silent contempt. The Democratic platform this year, however, is so emphatic in its denunciation of the protective theory as to give a certain faint plausibility to the affected alarm as to impending free trade. We should not have supposed this feeling to exist to any extent had it not been for a recent utterance by a journal of moderate Republican and protectionist tendencies, the *Wool and Cotton Reporter*. This journal declares that it

"does not believe the McKinley Bill and tariff for revenue only were the sole alternatives of those who sought in 1889-'90 a rectification of the tariff errors of 1883. The time was ripe for such a revision of duties in a downward direction as would have made the tariff laws then framed a finality for some years to come on the basis of moderate protection. That was a sound and reasonable doctrine which the McKinley Bill departed from, that our tariffs should be so framed as to yield the greatest possible measure of protection to American labor without fostering monopolies, and if the recent National Democratic Convention had not shown its usual capacity for blundering by adopting an extreme revenue-tariff platform, we believe the people of the nation would have put themselves on record as condemning the McKinley Bill by a large majority."

Now we do not agree with the *Reporter* as to what is "sound and reasonable doctrine." Many years of investigation have only strengthened our conviction that the à priori argument in favor of free trade is supported by overwhelming evidence from experience. We are unable to discover the slightest ground for supposing that "American labor" as a class has ever derived any benefit from protective duties, while we find most abundant reasons for concluding that these duties have been detrimental to the whole community. They have injured workingmen not only by reducing their remuneration, but also by stimulating the importation of the less desirable sort of foreigners, such as constitute the mass of the population of towns like Homestead. We entirely coincide with the *Reporter*, that general high wages are extremely desirable. Our difference appears when it is proposed to attain this result by taxation intended to drive laborers and capitalists out of those employments which they have found most profitable. This result the *Reporter* supposes to be attainable by such taxation. We do not, and the difference between us is radical.

But when we pass from the consideration of "theory" to that of the "condition that confronts us," our differences become immaterial. What is said in a political platform is important only as it is likely to be embodied in legislation; and conceding that the Democratic platform calls for free trade, free trade is an obvious impossibility. The Republicans have taken care to provide against danger from that source by incurring future liabilities that cannot be evaded. A large revenue must be provided, and we see no way in which it can be provided except by retaining

many duties that are "incidentally protective," and by maintaining an average rate that will more than balance the supposed greater labor cost of our manufactures. The Mills Bill was a conservative measure, even from the point of view of the *Reporter*, but the prospect is not very hopeful for even so much of reform as that bill contained. Unless our expenditures can somehow be cut down, increased rather than decreased taxation is to be expected in the future. We cannot have the crops of 1891 every year, but we can depend upon the magnitude of the appropriation bills.

The "condition" that confronts us, therefore, is the prospect of moderate tariff reform if Mr. Cleveland is elected, and the certainty of the continuance of the McKinley policy if Mr. Harrison is elected. There is not a voice in favor of tariff reform uplifted among Republicans, or if such a voice is raised it is drowned in the overwhelming outcry of the protected interests. In their present situation the Republicans cannot and dare not reform the tariff. They know that if they do not all hang together they will hang separately. Whenever they have tried to reform the tariff they have made it more prohibitory, and they must yield to this tendency or lose their following.

Since the *Reporter* desires moderate tariff reform, and will get it from the Democrats and will not get it from the Republicans, it seems to us that it should exert itself for the election of Mr. Cleveland. Its apprehension on account of the "free-trade platform" of the Democrats will melt away before the light of reason and experience. The more intelligent class of manufacturers in both the cotton and the woollen industries, as the *Reporter* knows, have no anxiety on account of Democratic success, but anticipate from it increased prosperity. The more influential class of Democratic statesmen, such as Representative Wilson, are in touch with the most intelligent business sentiment of the country, and Mr. Wilson, in the current number of the *North American Review*, shows what the reform policy of the Democrats is. Has the *Reporter* any serious fault to find with the six bills passed this year by the Democratic House of Representatives? Would not the country be much better off if the moderate reforms of those bills had been accepted by the Republicans? Which party adopted a really conservative policy?

But it is not enough to consider this election alone. Few Republicans who expect victory this fall are so sanguine as to hope for it four years from now. But four years from now it is scarcely to be hoped that the Democrats will have a candidate possessing the admirable qualities of Mr. Cleveland, a man in close relation with the intelligent patriotism of the country, competent through his associations as well as his own abilities to form wise judgments of legislative measures, and strong enough to guide his party. Such opportunities for prudent and conservative reform come rarely, and it is folly to neglect them. The McKinley Act produced such a popular uprising as nearly swamped the conservative Democracy. Four years more of the rule of the protected ring may bring about such a revolt as will be wholly unmanageable. For those who sincerely desire moderate reform, now is the time and Mr. Cleveland is the man. We trust that the *Reporter* and those who think with it will be found among "the people of the nation" who are going to "put themselves on record as condemning the McKinley Bill by a large majority."

THE EAU CLAIRE LUMBER CASE.

On September 1 the railroads in Wisconsin restored the lumber rates to the basis prevailing before the decision of the Inter-State Commerce Commission. The demand of the lumbermen of Eau Claire for lower charges, the order of the Commission, and the practical ignoring of that order by the railroads concerned, present an unusual instance of the difficulty of regulating transportation rates (and therefore values) through legislation.

The facts of the case are interesting as showing how dependent for growth Western towns are upon railways. Three small rivers penetrate the pine region of Wisconsin—the St. Croix, the Chippewa, and the Eau Claire—and down these streams the logs are floated to the sawmills. The town of Eau Claire is well situated at the junction of the Chippewa and Eau Claire Rivers. Logs floated down these rivers can be manufactured into lumber at Eau Claire or carried further, into the Mississippi, and thence to the town of Winona, Minn., or La Crosse, Wis., where, as well as at Eau Claire, there are extensive saw-mills. The greater part of this lumber cut is sold in the cities on the Missouri River—Omaha and Kansas City—and for a decade or more Eau Claire and the Mississippi towns have been bitter rivals. Lumber from Eau Claire is carried by the Chicago, Milwaukee and St. Paul Railway only, which also touches Winona and La Crosse. The Chicago and Northwestern serves the two points just named, but does not reach Eau Claire. In 1884, after rate wars, the whole question of relative charges from west of Lake Michigan to the Missouri River was submitted to George M. Bogue as arbitrator. Mr. Bogue, among other things, found that Eau Claire should pay 5½ cents per hundred pounds more than Winona and La Crosse, that being in his opinion the measure of its advantage in position. This higher rate from Eau Claire ("differential," as railroad men call it) has been in effect from 1884 to the present year. Under this differential Eau Claire has relatively declined as a lumbering town, while Winona and La Crosse have increased their output. Sawing lumber being the principal industry, the general trade and importance of the places have been affected in the same proportion. Eau Claire complained to the Inter-State Commission, which body, after hearing much evidence, found the differential against Eau Claire to be too high, and ordered the St. Paul to reduce it from 5½ cents to 2½ cents per hundred weight. That railway company complied with the order by quoting lumber from Eau Claire to Kansas City or Omaha at 3 cents less, whereupon the Northwestern reduced the Winona and La Crosse rate 3 cents also, leaving the difference exactly as before. Moreover, it was the intention of the Northwestern to keep the rate from the Mississippi towns at 5½ cents under Eau Claire, no matter how low the St. Paul Company might make the latter charge. If now the St. Paul had persisted in its position of reducing the Eau Claire rate as commanded by the Inter-State Commission, a rate war would have ensued which would have involved the whole Northwest and have entailed heavy losses upon all concerned. Not wishing for such a result, the St. Paul agreed to restore rates to the basis of the Bogue award.

The Inter-State Commission acknowledged that in this case it could not reach the Chicago and Northwestern Railway, for this road's rates from Winona were no discrimination against Eau Claire, because it did not run there. Could the St. Paul be blamed for accepting at Winona the rates forced upon it there by its competitor? Would Eau Claire have gained any advantage if the St. Paul Company had kept the Winona rate unchanged, provided the Northwestern quoted the Winona tariff three cents lower? What, then, can be done about the matter? It is very difficult to say. The testimony before the Commission seemed to show that the differential had in the course of years become unjust—that is, that 5½ cents was more than equal to Eau Claire's advantage, even on the theory of the award that the towns ought to be put upon a commercial equality. What reason, therefore, can the Northwestern Company advance for not conceding this act of justice to the injured town?

This question brings us directly to one of the principles of transportation which is often ignored, namely, that a proper charge for carriage is often as difficult to determine theoretically as a proper price for meat. The avowed object of the Inter-State Commissioners' order was to give to Eau Claire a larger share of the common cut of lumber. The result of such an increase would of course be to reduce the output of Winona and La Crosse. Hence the one railway which practically carries all the Eau Claire lumber would get a larger traffic, and the Northwestern, upon which Winona and La Crosse rely, would lose that much traffic in common with the declining trade of those towns. What matters it to the Northwestern that Eau Claire is suffering from an unjust differential? Its business is to preserve its

own tonnage, not to grant concessions which will benefit rival towns and carriers. In such a case that company may ask whether there is such a thing as "abstract justice" in transportation. Every spot in Wisconsin near the forests, and which might if favored by a railroad become a lumber centre, might make the same claim as Eau Claire. In one sense every sawmill not near a railroad is discriminated against, because it costs just so much more for the lumber to reach the market. If there were in Wisconsin a town site capable of becoming a manufacturing place, and if such town-site owner should complain that the advantages of his situation were not recognized, we should be tempted to reply to him, "Build your own railroad." A new railroad, or at least one whose interests are identified with that town alone, seems at present to be the only solution of the Eau Claire problem. It is useless to complain that the Northwestern, which has no thought for Eau Claire, is unfriendly, or that abstract justice is now being violated by a system of tariffs which has been in use for eight years. It requires force, not theory, to rearrange business so long established, where the main opponent is beyond legal reach.

GEORGE WILLIAM CURTIS.

JOURNALIST, orator, man of letters, the leading Independent in our politics, the foremost among those who have endeavored to redeem our civil service from the baseness of a partisan system of rewards and punishments—such was George William Curtis, who died after much suffering on August 31. He was born in Providence, R. I., February 24, 1824, and was thus, as it were, sealed from his birth to that "soul liberty" of Roger Williams's proclamation which was a watchword often on his lips. With Lowell's birthday on the 22d of the same month, and Longfellow's on the 27th, there was here a pleasant omen of the friendly nearness of these men that would enrich his life; Lowell's the nearer, that the omen might not lack anything of exactness. On his father's side he came of a family that had long been honorably known in Worcester, Mass., and his father, George Curtis, was a man of pronounced business faculty. His mother was a daughter of James Burrill, jr., at one time United States Senator from Rhode Island, and at another Chief Justice of the State; and hence we may imagine that direction of his blood which tended to a life of public interests rather than one of mercantile pursuits. The latter would have pleased his father more, and to this end, in 1839, after the boy had been at a boarding-school near Boston for four years and with a private tutor for another, he was placed in a German importing-house in New York. In these years he had lost his mother, and his father had married again and come to New York to engage in banking. The boy's school-life at Jamaica Plain is supposed to be freely rendered in the opening chapters of 'Trumps,' Mr. Curtis's only novel (1858-'9), and not his most successful book.

By this time the transcendental movement was in full swing, and young Curtis's interest in it soon became much deeper than his interest in the routine of business, and he broke away in 1840 and went to Brook Farm, where he remained about four years. This episode afforded him acquaintance with Hawthorne, Margaret Fuller, Ripley, Emerson, Alcott, Parker, and many other permanent residents or transient visitors at the Farm, and laid up for him a store of happy recollections, on which he drew delightfully in his later years in conversation and in the lucubrations of his "Easy Chair"; with much graver matter, telling of his exploits in washing dishes and how he danced the clothes-pins from his pockets in the evening's joyous round. From Brook Farm he passed to Concord, Mass., and there for two years increased his intimacy with Emerson, Thoreau, and Hawthorne; the last-named, at ambrosial feasts in Emerson's parlor, "riding his horse of the night" in silence for the most part—in whatever company, alone. In his 'Homes of American Authors,' Mr. Curtis's memory of these years helped him to many a vivid stroke; among others, to that tragic incident of a poor girl who drowned herself, which furnished Hawthorne with the basis of his drowning of Zenobia in 'The Blithedale Romance.'

From August, 1846, until August, 1850, Mr. Curtis was in Europe, and he never went again and never felt any pressing inclination to do so. It may well have been, especially in the later years, because he knew that it would be "another Yarrow," and another everything, if he went again. His itinerary, even for those times, was of uncommon interest, for it took him first to Italy, then to Switzerland, Germany, Holland, Egypt, Palestine, and to England on the eve of his return; and it coincided with a period of great events—that of the revolutions of 1848. In Italy, wit" others, he risked a dangerous walk from Como to Milan, and he was in Berlin at the time of the outbreak, and saw that most impressive sight, the coffins of a hundred or more of the dead revolutionists borne in long procession on the shoulders of their comrades to their burial. He made many acquaintances that were an honor to his youth and a growing satisfaction to his maturer years; the Brownings possibly the most precious of them all. The manner of his meeting them is related in one of the "Easy Chair" papers included in the select volume published in 1891.

But Mr. Curtis's travels were of more importance because of the literary fruit they bore than because of any enjoyment that he reaped from them at the immediate time. This fruit—the 'Nile Notes' and 'The Howadji in Syria'—was of an Eastern daintiness which melted in the mouth. They were not the stuff to brace the intellectual or moral man, but they were no vain repetitions of a theme which, even then, was not unworn; they were fantasias upon it which involved every concrete detail in rosy mists of fancy and conceit. The manner was not unrelated to other writing of the time, but it had the stamp of individual talent upon every page. Here, as in 'Prue and I,' sentiment was pushed to the verge of sentimentalism, but not across the line. The 'Nile Notes' was published in 1851, and 'The Howadji in Syria' in 1852; and the latter gave to Mr. Curtis a sobriquet that clung to him for many years and into a period which had little in common with the dreamy languor of the Howadji. While Mr. Curtis was abroad he furnished occasional letters to the New York *Times* and *Tribune*, of which his friends Henry J. Raymond and Charles A. Dana were then managing editors. His first literary work after his return was in the way of musical criticism for the *Tribune*, and simultaneously, or soon after, he wrote a series of letters for the same journal about the Catskills, Niagara, Saratoga, and other places of summer resort. These were gathered into a volume in 1852, and they are as pleasant now as when they first appeared—pleasanter than the places which they celebrate are now, except Niagara, which, like Browning's forest, has "relapsed to its ancient mood." And here it may fitly be mentioned that Mr. Curtis's predilection for "doing good by stealth and getting found out," though for the second part he did not care, had a fine illustration in his silent partnership in the enterprise which saved Niagara from private greed and made it the possession of the State. No one except his friend Prof. Norton was more helpful in that business.

In 1852 Mr. Curtis did his first work for *Harper's Monthly*, the earliest of his comments on the social world, foregleams of 'The Potiphar Papers' and the long bright day of genial, social satire that was afterwards to shine in his department of the same magazine. But in the meantime he was to have some pleasant and some sad experience as the editor of *Putnam's New Monthly Magazine*. Parke Godwin and Charles F. Briggs, yclept "Harry Franco" in Lowell's 'Fable for Critics,' were associated with him in the editorial care. In it, as in no previous venture, was the promise and the potency of our present *Harper's*, *Century*, *Scribner's*, and *Atlantic*. But it had a character of its own, not reproduced in any one of these, though in the *Atlantic* more than in the others. Mr. Curtis contributed to it his 'Potiphar Papers' and his 'Prue and I,' the former his most satirical performance, showing unmistakably the influence of Thackeray, for whom he had the warmest admiration, increased by personal acquaintance; and though he could not be other than a "kindly wag," his spear disclosed abundant snobbishness and other folly in the social world. 'Prue and I' was very different, the most charming bit of sentiment he ever wrote. The different papers which made up 'The Homes of American Authors' were also written for *Putnam's*. His business connection with the enterprise was less fortunate. When the magazine changed hands, Mr. Curtis connected himself with the new firm, which soon failed. Well might Lowell write to William Page, a common friend, "Tincture of laurel is not good for daily bread." By availing himself of legal technicalities Mr. Curtis might have escaped his share of the responsibility, but he was incapable of doing this. Holding himself morally responsible, he went to work as heroically as Sir Walter in his last years, but fortunately with youth and health upon his side, to pay a greater sum than he had ever hoped to gather for his own.

He was now settled in his "Easy Chair," and was also writing a series of papers for *Harper's Weekly* called "The Lounger," but his income from these sources did not begin to meet the creditors' enormous claim. He enlarged his lecture field and gave some years a hundred lectures in the season for such edification. His rivals were Beecher and Chapin and Parker and Emerson and Phillips and many of less note, but no one was welcomed more cordially than he or did less to debase the currency which he exchanged for "Fame," as Chapin called it—"Fifty And My Expenses," then a maximum rate. Parker was more massive, Emerson more profound and mystical, Phillips more incisive, Chapin more vehement, Beecher more humorous and impassioned, but Curtis had a charm of voice and manner of his own, suiting the dignity of noble thoughts expressed in musical cadences. Many of his lectures were upon literary sub-

jects, but always with a lively feeling for the personality behind the book. His "Sir Philip Sidney" was related to his repertory much as Phillips's "Lost Arts" to his, which was much more contracted; and ever, as men heard it, they confused the speaker with the man of whom he spoke. As the anti-slavery combat deepened, his lectures took its impress more and more, until frequently it became his solitary theme, and he must go from Dr. Furness's house, in Philadelphia, to the lecture-hall with eight revolvers in the pockets of as many friends to insure his safety. But, whatever the subject or the inspiration of the lecturer or the editorial contributor, the bulk of all his earnings for a dozen years and more went to the payment of his debt. Yet could political passion rage so fierce in 1884 that men who knew all this could not account for Mr. Curtis's political course but by imputing to him mercenary motives!

Students of Lowell's life have found in his great love for Maria White and his happy marriage with that lady the secret of his deepening purpose and his devotion to the anti-slavery cause. Late in 1856 Mr. Curtis was married to Anna Shaw, and John C. Frémont was at the wedding. Mr. Curtis had just done his best for this candidate in the Presidential campaign, but the Quakers had not "come out," and Frémont could lend to Mr. Curtis's nuptials only the ornament of a defeated general, still picturesque, as he had always been, and little more. But the coincidence of Mr. Curtis's political beginnings with his marriage is too obvious not to suggest a wonder whether here also there was not a *propter hoc*. Certain it is that his wife, a daughter of Francis George and Sarah B. Shaw, and sister of Col. Robert G. Shaw, who was "buried with his niggers" at Fort Wagner, and of Josephine, who married Col. Charles R. Lowell of like glorious fame, was of a stock and parentage so earnest and so philanthropic, and was so true to all their inspirations, that Mr. Curtis may well have found some heightening of his aims in his new life and love and in the new associations that now touched his spirit. Before this there was little in his character that prophesied the man he came to be. It seemed much more likely that his star would lead him to a career exclusively literary, if not dilettantish, than that he would be found among the prophets of political justice and the organizers of political reform. But there was little doubt which way it was leading him after 1856. From that time onward the anti-slavery conflict became more engrossing to his mind and heart, and entered more largely into his public utterance. Not content with this, he entered vigorously into the local politics of Staten Island, where he had made his home, and soon found himself Chairman of the Republican County Committee, an office which he held for many years, nor was it any sinecure as held by him. In 1860 he was a delegate to the Republican Convention which nominated Abraham Lincoln; though Seward was his candidate, he afterwards appreciated to the full the happy fortune which secured the honor for the less experienced but wiser man. A speech which Mr. Curtis made at this Convention was the most impressive and effective of all the shorter speeches of his life. A motion by Joshua R. Giddings to add a clause from the Declaration of Independence had been lost by a large majority in their desire to conciliate the border States. Mr. Giddings was about to leave the Convention when he was brought back by John H. Bryant, a brother of William Cullen Bryant, to hear a motion by Mr. Curtis which differed inappreciably from his own, and a speech in its support which carried the Convention with its impassioned eloquence and secured for the motion a unanimous vote. After Lincoln's election, Mr. Curtis's energy on the platform and the stump was directed to so husbanding the victories of the war that they should be the victories of emancipation. But before the war was over (1863) he had become the political editor of *Harper's Weekly*, and thus secured "a door of utterance" much wider than the platform of the lecturer had afforded him. In 1869 he was urgently invited to assume the editorship of the N. Y. *Times*, Henry J. Raymond having died. Many have felt that here was the most splendid opportunity he ever had, yet he put it from him as a forbidden thing.

Mr. Curtis has been often spoken of as one who abandoned a literary career for that of politics and reform. But he did nothing of the kind. Ruskin assures us that all rivers have their deep and shallow side. It may not be so—most likely it is not; but Mr. Curtis had his deeper side in his political activity, and a side less deep where his mirth and humor played in and out among the social topics of the time, among men and books, as the sunlight plays among the leaves and pebbles of a river's shallower side. The literary impulse of his youth was continued in the essays of his "Easy Chair," but the essays were not editorials and the editorials were never the superfluous products of his "Easy Chair." It was remarkable that two lines of production could be kept so perfectly distinct for thirty years. But in all this time, and especially in the concluding score, Mr. Curtis had a third instrument of use and power, the oration, in which the strength of his editorial writing and the beauty of his essays both found expression, while there was scope for other faculties which these did not employ, something architechtonic, which evolved their structure into a noble symmetry,

> "swelling up loudly
> To a climax and then dying proudly."

In these last years Mr. Curtis wrote but few lectures in the manner of those earlier ones which delighted both the town and the country mouse, but he wrote and delivered many orations, and their structure was quite different from that of his lectures. They were generally read, but they had not the effect of reading, and when they were memorized, as at the laying of the corner-stone of the Washington Arch, there was no creak of the *memoriter* machine. He was the ornament of many great occasions; municipalities and States were always seeking him for their great commemorations and to honor their illustrious dead. His eulogies upon Sumner and Phillips and Bryant and Lowell were all significant and admirable, each subtly fitted to its special theme, and that upon Lowell (1892) fitly concluding the distinguished line. Each one of these and every other was made the vehicle of some impressive lesson needed by the hour. And the same is true of all that multitude of speeches which he delivered at civic banquets and on similar occasions.

Already a generation has arisen that knows not the Hon. Thomas A. Jenckes of Rhode Island, who in 1865 framed the first practical measure of civil-service reform, and, by his intelligent and earnest advocacy, compelled an unwilling legislature to give it at least the semblance of a trial; but Mr. Curtis was always ready to disclaim the honor, which was frequently accorded him, of being a pioneer in that "wilderness of shameful precedent." He always cherished for Mr. Jenckes a sense of loyalty as to a living chief. He became at once his second in command, and in 1871 was appointed by President Grant to the Chairmanship of the first Civil-Service Commission. He never doubted Grant's sincerity or earnestness in the matter, but the President felt himself too much alone to keep up the weary fight. It was given up in 1873, and Mr. Curtis, whose hopes had been absurdly high, was correspondingly depressed and full of mortification and chagrin. But he soon rallied, and, under his guidance, and inspired by his resolve, the National Civil-Service Reform League was formed in 1881, with local organizations wherever a nucleus of political idealists could be found. The first of these, the New York Civil-Service Reform Association, had been organized in 1877 and reorganized in 1880, from which time Mr. Curtis was its President, drawing to him many strong allies. In *Harper's Weekly* he applauded every onward step, and stigmatized in fitting terms each old abuse or cowardly retreat. He was in correspondence with every Senator and Representative or State official or municipal officer in whom there was any hope of better things. At each annual meeting of the National League, as its President, he made a careful address in which he counted up the losses and the gains and measured men according to their works. And his reward was great. At the time of the last annual meeting already more than 36,000 national offices had been redeemed from the spoils system and made subject to competitive examination and promotion upon merit—to say nothing of the reform effected in New York and in Massachusetts; while bills have been proposed in the present Congress which, if only evidence of that "hypocrisy" which is "the homage that vice pays to virtue," are signs that may not be despised.

To support Gen. Grant in 1872 was a great strain on Mr. Curtis's loyalty to his party; when it came to supporting Mr. Blaine in 1884, the strain was more than he could bear. At the Convention which nominated Blaine he did his best to avert the evil; and when that proved impossible, faithful to his constituents, he remained until the end, to save, if possible, a little from the general wreck. A conference of Independents was soon after held, and an organization formed allying the recalcitrant Republicans with the interests of Mr. Cleveland in the pending election. Of this conference and organization Mr. Curtis was the life and soul. His editorials gave no uncertain sound. They had always been the exact expression of his own opinions, absolute and complete, equally free from partisan duplicity and personal control. Once, in the Cornell or Folger time, when a phrase in one of them had been softened by his publishers, he being out of reach, the next week the paper was without an editor, and that was sufficient for the understanding that there should be no further tampering. Now, he and they were wholly of one mind. But the campaign was fraught for Mr. Curtis with the utmost bitterness. Day after day his mail came to him foul with anonymous abuse and the reproaches of his dearest friends. And no man had loved the Republican party more than he. Had he remained in it, we are assured that his ideals would have compelled the allegiance of the party soon or late, and that honors only less tempting than the highest would have been at once within his grasp. But for him to remain was simply impossible. Great offices had for him no great temptation.

President Hayes had wished to make him Minister to England, and, further on, to Germany, but he preferred his editorial chairs, though each had no doubt those "thorns in the cushion" of which Thackeray wrote so feelingly. Once he had accepted a nomination for Congress, but it was only "to stand up and be shot at," without expectation of success. But these things were neither here nor there. He could not support Mr. Blaine with a good conscience, and therefore he could not support him at all. In 1888 he again supported Mr. Cleveland. Not that he was by any means satisfied with his administration of the civil service, but he thought Mr. Harrison would do much worse, and the event has justified his premonition. Latterly, with renewed confidence in Mr. Cleveland, his confidence in the Democratic party as represented by its managers and Congressional representatives and Tammany Hall had steadily declined. But the nomination of Mr. Cleveland in spite of these assured him of the sounder mind in the great body of the party.

In 1867 Mr. Curtis was Chairman of the Committee on Education in the State Constitutional Convention, and in the course of the debates he urged the enfranchisement of women in a speech of great ability, but without any practical result. The enlargement of women's educational opportunities was a matter very near his heart, and he brought all the resources of his humorous satire to bear on the opposing party. As a member of the Board of Regents from 1864 he exerted a happy influence on the educational methods of the State, and as Chancellor of the University of the State of New York he mediated graciously between the confidence of the larger universities and the jealousy of the smaller colleges and academies. As President of the Metropolitan Museum his influence was steadily for the improvement of its collections and their more unrestricted popular use on all days of the week. He was the President of the National Conference of Unitarian Churches and a Vice-President of the American Unitarian Association. That he was also an officer of the Free Religious Association shows that his Unitarianism was of the radical type. In the little Unitarian Church at Staten Island he often read the sermons of Martineau and Dewey and others to "audience fit though few."

In 1889 Mr. Curtis edited an edition of John Lothrop Motley's letters, and it was characteristic of his genial disposition that he omitted almost every reference to the most painful episodes of Motley's life. It was only natural that there were those who thought that this was not well done.

No man was ever less inclined to insist upon the maxim, "The laborer is worthy of his hire." He did a very great amount of unrewarded, often thankless, work, especially as he answered every decent letter he received, however stupid it might be. He was prodigal of help to those who sought his judgment in great literary tasks. His eloquence was often at the service of some honorable cause or valued friend. In every personal relation he was a good man to know, a better man to love, as relative or friend. He was full of pleasant talk and golden memories of persons and events, nowhere more interesting and engaging than in some friendly circle; everywhere, and especially in his own home, the least formidable of men, putting the most awkward at their ease. His most remarkable endowment was not any intellectual distinction, any imaginative force or originality of mind, but a character which united in itself the rarest gentleness and the sternest sense of duty and resolve to have it done. He was our Puritan cavalier. His gracious manners masked an iron will. He added nothing to our literature which did not make for kindness, charity, and peace; nothing to our politics which does not shame its ordinary levels and beckon it to higher things.

THE INTERNATIONAL CONGRESS OF EXPERIMENTAL PSYCHOLOGY.

LONDON, August 15, 1892.

IN this age of congresses, literary, theological, and scientific, it is not strange that the workers in the new science of psychology should want a congress; and it may now be said, after two meetings of the above-mentioned body, that they have one. I say in the new science, because there can be no doubt that the psychology of the present is new, however much we may deplore the attitude of those who go the length of saying that there never was an old science, meaning that psychology has never until now been scientific at all. Whatever judgment our descendants may pass upon this question, we may thankfully claim that our psychology is more scientific today, and that it is sufficiently so to have a congress.

Congresses may be said to have two main functions, one scientific and the other social. There are those who say that they should have only one function, the scientific; and there are those who claim that, as a matter of fact, they have only one function, the social. I think, speaking from the point of view of private experience only, that both these functions are subserved in what we may call the stimulative function of congresses. It seems to be true that the savants do not save their best things to present at congresses, and it would be very difficult to get them to. But, on the other hand, leading savants do attend, and, by their attendance no less than by what they read, they stimulate and help the brethren. There can be no doubt that the members go away with new ideas, new sympathies, and fewer prejudices; but the reason of it is to be found largely in the personal intercourse which occupies the hours between the sessions.

The present Congress, while successful in most respects, yet lacked one thing which, in most gatherings of the kind, has been an important stimulative feature. The programme was allowed to grow to such length that altogether too little time was given to discussion and criticism. About the only consideration, as I conceive, which would be of weight as an inducement to the presentation of an important paper at such a meeting would be that the author might thereby have criticisms upon it which he could use before putting his work into final form for publication. This is especially important to unknown men, who could not be sure that their papers would be widely read and discussed after their appearance in the journals. A well-pointed criticism from an expert might, indeed, save the printers and the public altogether in some cases! And the contents of the most valuable papers would be made a thousand-fold more available if followed up by a half-hour's close, hand-and-glove discussion.

The London Congress was wofully wanting in the exercise of the right arm of criticism. It was the more to be regretted from the fact that the Congress is not yet universally recognized; and the authorities who deny it their influence, do so on the ground that it reflects too much the uncritical and suprascientific tendencies of the left borderland. Prof. Wundt, in an article on "Hypnotism and Suggestion" in the last issue of the *Philosophische Studien*, brought the charge in a manner which did not lack clearness; and that this is not an isolated example is seen in the scanty delegation, in numbers, sent to the meeting by the Germans. Prof. Wundt's charge was, in brief, that hypnotism, the romance of psychology, was the dominant topic of the Paris Congress in 1889, and that telepathy, the climax of romance, would be the keynote this year at London. As respects the London meeting, the programme and its successful accomplishment are an answer to the charge, as a matter of fact. But I think that the answer would have been more adequate if the Congress had discussed more fully all the papers presented. For example, the report of the Census of Hallucinations passed with no remarks, save a question or two; and the interesting papers of Mrs. Sidgwick on "Experiments in Thought-Transference" and Mr. Myers on the "Induction of Hallucinations" had even less examination. I mention these because they are the subjects which outsiders look at suspiciously. A good discussion, involving some criticism and calling out the lines of defence, would have done more to justify the right of the Congress to the term experimental than any number of verbal explanations. The lack of discussion was due, however, as I think all would agree, to want of time, and to the inadequate arrangements for getting the printed *précis* of the papers into the hands of the members in advance—not to lack of critical interest. At such meetings the *précis* should be distributed at least a day in advance—a plan which was proposed, also, at the recent meeting of the British Association at Edinburgh.

The Congress met on August 1 in the rooms of University College on Gower Street. There was an unexpected appropriateness in this, in that one of the Secretaries, Mr. James Sully, had just been appointed professor in that institution. The presiding officer, Prof. Henry Sidgwick of Cambridge, was assisted by the following vice-presidents, whose names I write in order that the truly international character of the membership may be indicated—to wit, Bain, Bernheim, Ebbinghaus, Ferrier, Hitzig, Liégeois, Preyer, Delboeuf, Richet, Schäfer, Baldwin. Besides the countries thus represented, delegates were present also from Russia, Sweden, Denmark, Italy, Holland, and Rumania. Among the names which gave *éclat* to the membership may be mentioned Helmholtz, A. J. Balfour, Herbert Spencer, Shadworth Hodgson, and Francis Galton.

The proceedings fell into three divisions, on the usual sectional plan. Besides the meetings in the Amphitheatre, at which papers of general interest were read, sections for "Hypnotism and Cognate Subjects" and "Neurology and Psychophysics" carried on their work in adjacent rooms. This was resorted to as a matter of necessity to accommodate the large number of readers. But its wisdom was questionable. Of course, at the meetings of such bodies as the British Association and its American sister, whose function it is to foster scientific work generally, sections devoted to the different sciences may do their work side by side; but it is not clear that work in a single science can be profitably prosecuted in this way. For example, how would it do to have three sections devoted to Historical, Practical, and Theoretical Geology, in a supposed geological congress? These subjects are not ex-

clusive, and a well-informed geologist would be interested in them all. So, to divide the psychological field in this way is, in my view, to deprive many members of many papers and many papers of many critics. The only cure for this, as well as for the other defect already mentioned, is to enlarge the sifting activity of the Committee on Communications. If all the papers were seen beforehand, and each given full time or not accepted at all, the meetings would be more stimulating, the published proceedings more valuable, and the honor of reading would be more highly prized by the younger men.

The general meetings were opened by Prof. Sidgwick's address. It was devoted to a discussion of the aim and proper work of the Congress. He defended the term "experimental" as a substitute for "physiological" in the official designation of the body—a change which was voted at the Paris meeting. He also took pains to inform us that Prof. Wundt's prognostications were not to be realized.

Prof. Richet read a paper on "The Future of Psychology." In his view there are four great topics to which scientific psychology should address itself: first, the physiology of the brain, and the relation of thought to cerebral circulation and to thermal and electric cerebral changes; second, the experimental study of sensation, ordinarily called psycho-physics; third, comparative psychology, including the study of animals, the insane, the criminal, of society and institutions and of education in theory and practice; and fourth, the "transcendental psychology," by which he means "clairvoyance, thought-transference, presentiments, etc."—in short, the line of inquiry begun by the Societies for Psychical Research. This may be taken as the platform of the science as one of the most eminent French psychologists understands it. It is interesting to note that it includes the subjects which, as I said above, some consider "romance." This programme suffers by defect in the mind of those of us who believe also in analytic introspective work; but no doubt the objective phases need more emphasis, especially in England.

Prof. Pierre Janet, of whom I spoke in a former letter, presented a noteworthy paper on "Anterograde Amnesia"—the name given by Charcot to the condition of a patient who has lost the power of acquiring new memories. Janet cites cases occurring in his hospital practice—one of them a very remarkable case in the Salpêtrière—which show that, although new events are not remembered consciously by such patients, and seem to leave no trace whatever in the mental life, yet in the hypnotic sleep, and even in ordinary dreaming, such experiences may be revived. "During the hypnotic sleep she recited without difficulty new pieces which she had seemed incapable of learning in the waking state." Janet has also succeeded in showing, by means of the automatic writing experiment, that such memories are present in subconsciousness at the very time that the patient is trying hard, but quite in vain, to recall anything of them from the past. This fact, that memories may be practically dormant, was the main point of interest also in Mr. Myers's paper on "Crystal-Vision," and in Janet's remarks following upon it. By gazing into a flat, bright surface some individuals can develop visual hallucinations which often take on the form of these subconscious memories. Especially may dreams and hypnotic suggestions be recovered again to consciousness in this way.

By way of interpretation of this—and of the corresponding fact, also brought out by Janet, that in cases of loss of will (*aboulia*), the patient may learn new actions unconsciously which he is incapable of learning by conscious effort—our psychologist holds that it is due to a disintegration of the complex of experiences which make up the conscious personality. When consciousness is no longer able by its synthesis to introduce new events into the circle which constitutes the empirical self, this is anterograde amnesia. But these new events are still retained and reproduced in subconsciousness, as the experiments mentioned go to show. It is, therefore, a particular case of psychic disintegration (*désaggrégation*). Janet's and Myers's papers excited some discussion, but not as much as they deserved.

Among the special topics treated, some of the more interesting may be mentioned. Prof. Henschen of Upsala gave a clear résumé of his views on "The Visual Path and the Visual Centre," published in detail in his *Beiträge zur Pathologie des Gehirns*. He localizes the visual centre in the *calcarine cortex*. His induction, although quite opposed to the view generally held, is important as being based on clinical cases. He does not need the caution that most workers in this field need, *i.e.*, that the analogy between animal and human brains must not be pushed too far. Prof. Schäfer communicated the results of experiments showing that the destruction of the prefrontal lobes in monkeys does not impair the attention, the inference being that these lobes are not the seat of the intellectual operations. This position is in opposition to the late results of Bianchi and of earlier experimenters. Schäfer may again be pressing too far the analogy just spoken of. He seems, however, to have made a step forward in method, *i.e.*, in merely severing the prefrontal region vertically from the brain mass, thus avoiding the shock and hemorrhage usually resulting from its complete removal.

Dr. Waller's paper on "The Attributes of the Cerebral Cortex" precipitated a discussion on the function of the so-called motor centres, participated in by Ferrier, Schäfer, Horsley, Henschen, and Hitzig. Details are impossible here, but I may say that psychologists need not be in haste to make up their minds as long as the brain physiologists are arguing for three distinct views, viz., the old idea of Ferrier, most current still, that the sensor and motor centres are distinct, the Rolandic region being only motor; the new view of Bastian, that this region is not motor at all, but purely kinæsthetic, the motor apparatus being lower down and out of consciousness altogether; and the view of Waller and Beaunis, that the anatomical distinction between sensor and motor is false, since every cellular process in the brain is both. This last, in my view, does justice best to the psychological requirements of the case, as I have argued elsewhere.

Space allows merely the mention of a half-dozen interesting papers on special themes. Prof. Ebbinghaus and Mrs. Ladd Franklin read respectively on "The Theory of Color-Vision" and "A New Theory of Light-Sensation"—the Helmholtz-Hering problem stated in two ways. Ebbinghaus returns to the *Sehpurpur*, which has been much neglected of late, derives from it blue and yellow, and postulates a *Sehgrün* substance from which sensations of green and red arise. Mrs. Franklin's new theory she calls the "Theory of the Differentiated Color-Molecule," an expression which those who are acquainted with the old theory of Donders will partly understand. Both of these papers are to appear, I believe, in the *Zeitschrift für Psychologie*—a reference with which I must content myself. Lehmann of Copenhagen contributed a research on the "Relation Between Respiration and Attention," which does not support Münsterberg's hypothesis that variations in effective attention are due to the innervation of the muscles of respiration. He finds that sensations of light, sound, and touch are hindered during both inspiration and expiration—that is, that sensorial attention is most effective during the pauses in breathing. This is confirmed, I may remark, by the fact that we unconsciously hold our breath or breathe softly when listening attentively.

Dr. Grüber of Rumania reported some extremely interesting cases of anomalous associations between the different senses, of which "colored hearing" (*audition colorée*) is the most familiar, though rare, example. Among the astonishing connections he mentions are sight-taste, sight-smell, sight-muscular associations, and sound-taste, etc. Moreover, he found in his subject a resistance-taste connection—a taste accompanying a given degree of muscular exertion. Even the temperature sense exhibited a kind of *chromatisme*. The range and richness of this subject's association of colors with words, syllables, letters, numbers, etc., is marvellous, and he may serve to give us a little relief from the famous Nussbaumer brothers, whom everybody has cited heretofore. In his remarks upon this paper Mr. Galton said that he had new evidence that the tendency to anomalous association is hereditary, but not so the details; a fact already illustrated in the Nussbaumer case, and seen also in the number-form peculiarity discovered some years ago by Galton.

Dr. Witmer of the University of Pennsylvania read the results of a research on the "Æsthetic Value of the Mathematical Proportion of Simple Figures," which tends from the point of view of exact experiment to establish the "golden section" of Zeising; and Prof. Donaldson reported the main results, already published, of his examination of Laura Bridgman's brain.

The hypnotic section was not very productive, although here the current discussions of the journals were actively reflected. Paris and Nancy both held the floor. Bernheim cited evidence to prove the purely psychic character of hysterical and suggested amblyopia; also the psychic character of the deafness, anæsthesia, etc., of hysterics. He holds that all these phenomena are due to a central or mental inhibition of sense data which are normally reported from the periphery. Dr. Bérillon of Paris, editor of the *Revue de l'Hypnotisme*, drew conclusions on the "Applications of Hypnotic Suggestion to Education," based on a wide range of experiments with children from six to fifteen years of age. He finds children normally very suggestible, and the more so, it is interesting to learn, the more healthy and normal they be. This last is a fact which may be of great importance in primary education, as I intimated in my last letter. It is easy to see how the acquisition of bad habits by children may be prevented by judicious suggestions—hypnotic, if necessary—of acts which counterbalance and neutralize what is mischievous.

The Proceedings of the Congress will appear in the autumn. They are to contain full synopses of the papers and discussions. A limited number of copies will be available for libraries, I believe, and for persons not members of the Congress. In the meantime, those who may want fuller information will find very good reports of many of the papers in the London *Times* for August 2, 3, and 5. A feature of

the Proceedings will be the publication, with each paper, of the name of the journal in which the author intends to print it in full.

The next regular session of the Congress is to be in Munich, in 1896, with Prof. Stumpf as President and Baron von Schrenck-Notzing as Secretary. An American committee was appointed, also, to consider the advisability of holding an extraordinary session in the United States next year. On the whole, the second session of the International Congress may be pronounced a success, and all who wish good to modern psychology must rejoice in the stimulus it has given to the investigation of mental facts by exact and scientific methods.

J. Mark Baldwin.

IN THOMAS HARDY'S COUNTRY.—I.

West Lulworth, August, 1892.

Thomas Hardy thinks that the time seems near, if it has not actually arrived, "when the chastened sublimity of a moor, a sea, or a mountain will be all of nature that is absolutely in keeping with the moods of the more thinking among mankind." He adds that ultimately, even to the ordinary tourist, spots like Iceland may supplant the vineyards of Southern Europe, and "Heidelberg and Baden be passed unheeded as he hastens from the Alps to the sand-dunes of Scheveningen." But if one seeks a combination of moor, sea, and cliffs almost deserving the name of mountains, he need not, if he is in England, travel far in search of it. If he is willing to sacrifice a little of the sublimity of the Alps, to avoid their overcrowded summer hotels, and will exchange the picturesque monotony of the beach of Scheveningen and the discomforts of Icelandic travel for the heaths and downs and cliffs of Dorsetshire, he can within five hours of London find himself in a spot which offers all the attractions enumerated by Hardy, and others in addition. It is so little known, even to Englishmen, that it is not likely to be familiar to their transatlantic cousins, and a brief summary of the experience of a couple of Americans who have selected it for their summer home may not at this time of year be uninteresting to those whose dog-day horizon is not bounded by the New Jersey or the Maine coast.

The defects of the summer holiday of the overworked business or professional man in America deserve more consideration than they usually receive. His vacation, to do him the maximum amount of good, should bring with it an entire change, not only of air and scenery, but also of thought, occupation, and general environment. It should lose none of its value by reason of its cost; it should give him opportunity to vegetate simply, if he so desires, or to keep up a certain amount of intellectual activity, diverting it, however, into new channels. New faces, new subjects of conversation, new experiences are often, as every medical man knows, of chief value in restoring the equilibrium between waste and repair in the brain-cells and other tissues of an organism which has been pushed beyond its normal physiological activity. These essentials of a summer holiday, regarded from the standpoint of the therapeutist as well as from that of the pleasure-seeker, are of course attainable in America, but they are too often ignored, and the life at Newport, at Narragansett, at Lenox, at Bar Harbor, at the Springs, becomes a repetition of the city life of the winter: the money-market is not forgotten, nor business cares laid aside by the one sex, while, with the other, toilets are as exacting, gossip as unceasing, and domestic duties as onerous as at any other time of year. It is with the idea of sketching the outlines of a holiday that seems to me to meet the proper requirements, that I have begun this letter.

The journey from New York to London in these days may be made to combine both comfort and economy. A train leaving London from Waterloo Station at 11:15 A. M., reaches Wool, in South Dorset, at 3:36, and in a few minutes rattles on towards Dorchester, leaving the passengers and their belongings on the little platform. To the properly informed visitor, one of the charms of the district begins immediately, if he is an admirer of Hardy's stories. To the north is seen a vine-clad, ivy-covered, many-chimneyed old manor-house, standing in a meadow through which runs the river Frome, crossed by a five-arched stone bridge with peculiar angular buttresses. The house is of great antiquity, and occupies the site of still older buildings, said to have belonged to a nunnery dating back to the time of Elfrida. Some unmistakable "herring-bone" masonry in the walls of one of the outbuildings fixes it as Saxon beyond a doubt, and fragments of stone chalices for holy water, narrow slits now filled up, on either side of the main entrance, through which alms could be passed by holy hands to profane wayfarers, and subterranean passages caved in and impassable, but thought by the irreverent to have once communicated with a neighboring monastery, all seem to favor the tradition which places a nunnery on the spot. This, however, is legend. What is certain is that, about 1630, it passed into the hands of its present owners from those of the D'Urbervilles, who became extinct. Its actual history has been uneventful, but it has gained a living interest for the admirers of Hardy from the fact that it was to this house that poor Tess was taken by Clare on the night of their wedding. It was across the stone bridge that he afterwards carried her in his sleep, and it was among the ruins of Bindon Abbey, hidden in the thick clump of trees an eighth of a mile to the eastward, that he laid her in the stone coffin.

One can reserve for another occasion a visit to the remains of the Cistercian Monastery of Bindon, and to the beautiful old carp pools in the depths of the surrounding woods, inky-black in the shadows, and no longer tenanted by the fat fish kept for the larder of the brethren. But before leaving the station at least a glance should be taken at the vast expanse of moorland to the north and west, which reaches almost to the horizon. It is Wool Heath—the "Egdon Heath" of the "Return of the Native," in which novel it is repeatedly described by Hardy, by whom, as a Dorchester man, every foot of this region is known and loved. He says that this obscure, obsolete, superseded country figures in Domesday Book, where it is known as "Bruaria," a heathy, furzy, briary wilderness. Leland, centuries later, speaks of it as "overgrown with heth and mosse," and it appears that its area has diminished little, if at all, down to the present day. The "barrows" or "tumuli" with which it is dotted, are to be seen here and there, and bring back the romantic incident in which Eustacia Vye (a name, by the way, still common here) brings Wildeve to her by building a bonfire on the summit of one of them.

A waggonette for the travellers and for the London servants engaged for the summer, and a donkey cart for the trunks, presently start along the six miles of winding and hilly road which leads across the "downs" towards the coast. On both sides at first are views of nothing but the broad, breezy, grassy, rolling plains, covered with grazing farms and dotted with innumerable flocks of sheep of the celebrated "Southdown" variety, indigenous to this district. After the highest point of the road has been reached and the descent begun, glimpses of the sea appear to the right between the cliffs which extend westward to Weymouth; to the left through those leading towards St. Alban's Head and Bournemouth. Close at hand is a picturesque break, Arish Mill, directly in front of Lulworth Castle. The road rapidly descends, passes a low ivy-covered typical English inn, with thatched roof penetrated by dormer windows, and becomes a winding, irregular street bordered by cottages in various stages of picturesque decay, but almost without exception exquisitely neat, covered by vines or ivy, and always presenting towards the road that most typical feature of English village landscape, a flower garden. The space devote to flowers may vary in size from a rod to that bounded by a half-dozen earthenware pots, but it is rarely absent from the home of a self-respecting Englishman, however humble his social position. It gives color and freshness and beauty to the least pretentious English village, and adds greatly to its attractiveness.

The winding street down which we drive constitutes the village of West Lulworth, which, beginning thus upon the hill a half mile from the sea, ends at Lulworth Cove, an almost land-encircled bay with a pebbly semicircular beach, bordered by high precipitous cliffs of chalk and Portland stone, and facing to the southward. The cottage which is our destination, and which was engaged by us a year ago, stands a little back from the road behind a low stone wall enclosing a pretty little garden and miniature lawn, on which grows a magnificent lime tree, completely overshadowing the grounds. The house is built in an excavation in the base of a steep, grass-grown hill, which rises almost perpendicularly for a hundred feet, and a portion of the side of which is occupied by a vegetable garden, sloping upwards at such an angle that it would seem easier to drop its products down the chimneys of the cottage than to bring them to it in the ordinary manner. It recalls Alpine or Tyrolese or Norwegian farms similarly placed, though at greater heights.

A gray thatched roof, with a line of red timber showing just beneath the eaves, diamond-shaped panes in the white sashes of the pointed windows, vine-covered trelliswork, and ivy-clad walls, flowering plants and geraniums on the window-sills, make up a sufficiently attractive exterior. Within, an old-fashioned stone-floored kitchen, with pantry, a dining-room of small dimensions, a drawing-room fifteen or twenty feet square, and overhead three bedrooms of corresponding size, with servants' room, etc., constitute the accommodations furnished by what is perhaps the largest cottage in the village. The gable end of the house overhangs a spring running out from beneath great gray boulders, and commands a view of the cove and of the open sea beyond.

Life here among this population of 150 or 200 fishermen, swelled in the summer by a few families from various more or less remote parts of England, is of the most primitive description. Our belongings, therefore, are correspondingly few, and in a few hours we are as thoroughly settled and at home as though we had lived here for months. The very nice old Englishwoman from whom we rent the cot-

tage, aids our new servants, who show themselves most willing and efficient; our clothes are put away or hung up, a few familiar photographs are placed on walls and tables, our travelling library is ranged upon the shelves, and, when dinner is announced an hour or two later, it seems as if we were just coming home after a short absence instead of beginning the experiment of housekeeping in a foreign land. It may be that inherited instincts are at work. Many Americans coming to England have noticed the development, possibly it should be called the reawakening, of feelings of affection and of liking almost strong enough to be termed loyalty, and they have not always been of the class of Anglomaniacs either. Hawthorne and Lowell and Bret Harte may be so classed by the hypercritical and ultra-patriotic, but there are others, of the most robust Americanism, who have felt and have not hesitated to acknowledge the same sentiment. At any rate, whatever the explanation, the prosaic fact is that we were able to settle into our temporary place in this little out-of-the-way spot with much more ease and serenity, and what we designate at home as "solid" comfort, than would usually be possible in moving from one house to another in the city of our birth.

The attractions of the place itself consist in the scenery of the neighboring coast, the historic and romantic interest of the towns and villages hereabouts, the beauty and variety of the spots which may be selected for sea-bathing, and, above all, the absolute quiet and repose of the whole region, almost any portion of which might have appropriately figured as the scene of Hardy's fine story, 'Far from the Madding Crowd.' He certainly knows Lulworth itself, as, many years ago, a legal gentleman to whom he had been articled, occupied the cottage from which I now write. This gentleman left the profession, and Hardy, fortunately for himself, for English literature, and for this and subsequent generations of novel-readers, was led into other paths.

The scenery here has a distinctive character of its own, differing somewhat from that on any other portion of the coast of the British Isles with which I am familiar. The many-colored serpentine of the Lizard, the dark, jagged granite of Land's End, the red-brown and the slate of North Cornwall and North Devon, the magnificent perpendicular gneiss and granite of the West of Ireland, have each a peculiar charm; but so have the cliffs of Dorsetshire. They consist of a series of hills ranging from 300 to 700 feet in height, with intervening valleys running down to the sea level. From their summits the view inland is over vast grass-grown expanses of rolling ground—the South Downs—and further yet across the moors and heaths which intervene before the hills of Devon and Somersetshire are reached. From the water, the face of the cliffs, which are almost or quite perpendicular, seems to be made up of parallel strata of limestone, curved and broken into all sorts of twisted and irregular lines, and varying in color from the creamy white of the almost pure chalk to the differing shades of red and yellow imparted by the presence of the salts of iron. This coloring is sometimes brilliant in the extreme, and one cliff, appropriately known as Golden Cap, when looked at from the westward on a bright afternoon, vies with any of the Dolomites in the richness of its tints, and would put to the blush even an impressionist water-colorist. The contrasts in coloring, too—not only on the face of the cliffs, but in the browns and greens and yellows of the grass which covers them, the blacks and purples where here and there a portion of bare rock peeps out from the chalk, and the changing shades of blue of the sea itself, varying with the sky—are a constant source of surprise and delight.

The bathing-places are as unfrequented as they are beautiful and peculiar. After a stay of some weeks, with baths varying in number from one to three daily, we have not once encountered any one else in some of our chosen spots, and have only twice been joined by a few young Englishmen at another place. Our party usually consists of two families, our own and that of a London friend, a distinguished professional man, who has a cottage close at hand. Before breakfast a dip in the Cove, or a row to its mouth and a dive from the boat, occupies a short half hour. After breakfast a row or sail to the eastward for a mile, past a "petrified forest," containing beautiful specimens of gigantic fossil-trees, brings one to a fine cavern known as "Smugglers' Cave," penetrating beneath the sloping layers of limestone for a considerable distance, and showing unmistakable evidence of having once well deserved its present name. Indeed, the whole coast was at one time the scene of very extensive smuggling operations, which here, as elsewhere where they take place, are regarded with peculiar leniency by the resident population. One of the most industrious and highly respected of the village fishermen has served his term in jail for one unsuccessful attempt out of many in which he was more fortunate; and the generation has not yet passed away in which the bringing in of illicit cargoes of spirits or tobacco constituted a locally recognized and entirely respectable avocation. Just above Smugglers' Cave, enormous slabs of rock, the projecting edges of the strata seen everywhere along the coast, run out so as to make a platform or shelf which affords a splendid view seaward and is one of our favorite perches. A little further to the eastward are the Mewp (or Muke) Rocks, gray, jagged masses of Portland stone, completely detached from the mainland, and covered with foam and breakers whenever a southerly wind prevails. Just back of them another sheltered cove with sandy beach and clear still water gives an opportunity for another bath, or permits a view of the wonderful panorama of animal and vegetable life on the bottom, some fathoms below. Still more to the eastward a break in the cliffs known as Arish Mill leads up directly to Lulworth Castle, a picturesque embattled edifice of the fourteenth century, which has been kept in repair and continuously inhabited since its erection. During all the intervening years it has remained in possession of one family, whose vast property extends in every direction, and is said to include twenty-five miles of sea-coast. The intimate history of such families, several of which still exist in England, dating back to Saxon times, preferring to remain commoners, yet the entertainers of kings, the practical lords and masters of miles of this little island, of dozens of villages, and, to all intents and purposes, of hundreds of people, would make a story of much interest, and one which, if faithfully written, would illuminate for foreigners many past pages of English history, and throw a flood of light on some of the social and political problems of the present day.

If a walk seems preferable to a row, five minutes' climb over a hill topped by the lofty coast-guard station, and then a steep descent by a sort of goat-path, lead to Stare Hole Cove, where a tremendous mass of Portland stone, hundreds of feet in height, has been separated from the mainland and fretted into chasms, arches, and tunnels by the action of the waves, leaving enclosed a beautiful little land-locked bay communicating with the open sea only by means of the openings thus worn through the great outside cliffs. A swim from the quiet dark-green water of the cove, through the blackness of one of these reverberating caverns, out into the sparkle and freshness of the blue sea beyond, is an experience to be remembered. At Durdle Door, still further westward, a rocky arch, thus fashioned by the sea out of the cliffs, is perhaps a hundred feet in height, broad enough to permit of the passing beneath it of a good-sized sail-boat, and entirely symmetrical. It shelters still another favorite bathing beach; and "Man-of-War Rock," near by, converts a portion of an open roadstead into a quiet lagoon with pebbly shores. And so the list might be continued, each spot having special advantages for bathing under certain conditions of wind and weather.

J. William White.

Correspondence.

THE PENSION ABUSE.

To the Editor of The Nation:

Sir: I have a recollection of seeing, a few years ago, among the communications to the *Nation*, one or more letters from some person, I think an officer of the army in the War of the Rebellion, who was making a study of the pension question. In the letters I refer to, the abuses of that system were set forth in vigorous language, and the writer intimated a purpose or desire of forming an association for the purpose of correcting those abuses or guarding against their increase.

I have since heard nothing further on the subject. If my memory is correct, and the communication in question did indeed appear in the *Nation*, I am anxious at this time to get in touch with the writer of it. I therefore send this to you in hopes that it will reach his eye. Should it do so, he would confer a favor on the writer, and do something which might be productive possibly of future public good, by communicating with you.

An Ex-Colonel.

August 30, 1892.

[Our correspondent has doubtless in mind Lieut. Allen R. Foote, who, on July 4, 1891, delivered an address in the District of Columbia on the viciousness of our pension legislation, and who was shortly reported to have organized, with some other old soldiers, a "Society of Loyal Volunteers," with the aim of effecting a revision of the pension system so that only persons actually in need should receive the Government's bounty.—Ed. Nation.]

MR. WHITMORE'S ANCESTRAL TABLETS.

To the Editor of The Nation:

Sir: I have just seen a genealogical chart entitled 'The Record of My Ancestry, containing the Genealogy of the —— Family and its branches from the year —— to ——. Compiled by ——. Book designed by the Rev. Frederic W. Bailey, B.D., Worcester, Mass., 1892.' It is marked "Copyright" and "Patent applied for." It is a blank book in which the owner is to record his ancestors, and, as it is

merely a modification of my 'Ancestral Tablets,' I wish to know on what the copyright or patent is based. My device, as is well known, was that of cutting holes in the pages so that a name could appear in more than one table. The invention, though trifling, has proved to be very useful, and its originality has never been disputed. Mr. Bailey has changed the position of the holes, and added some ruled spaces for photographs, etc. He has not, so far as I can see, acknowledged his indebtedness to my work, though he says that "at last, as a matter of necessity, he has, with the results of his experience, published the enclosed." As an equal "matter of necessity" (for the copyright in such a matter is mainly honorary), I feel called upon to warn your readers that whatever is good in Mr. Bailey's book is taken from mine, that his additions are trivial and confusing, and that my 'Tablets' are still published by DeWolf, Fiske & Co. of Boston. Yours very truly,

WILLIAM H. WHITMORE.

BOSTON, August 30, 1892.

MEN AND WOMEN TEACHERS IN CHICAGO.

TO THE EDITOR OF THE NATION:

SIR: I read with compunction "E. L. M.'s" communication of August 18, in which he attributes the small per cent. of boys who complete the grammar and high-school course in the Chicago schools to the fact that the great majority of the teachers are women, and that "boys don't like petticoat government." While he does not advise that women be eliminated as a whole from the public schools—for he admits that they show a peculiar fitness for the places with small salaries attached—he urges that for the good of the "future voter" they be no longer retained in the best-salaried positions. He trembles to see them holding principalships, he trembles more to see them holding grammar principalships, and he trembles most to see them holding principalships in those schools having a thousand or more pupils, where their presence, he freely asserts, is the great and potent factor in driving the boys out of the higher grades.

Now, with the memorable Gradgrind, I want *facts*. I have therefore collected facts, and herewith respectfully submit them for the delectation of "E. L. M.'s" imaginative mind. Chicago has one hundred and six grammar-school principals; forty-one are women, sixty-five are men. From those schools in charge of what "E. L. M." speaks of as college-bred men of broad ideas, working for small pay and small appreciation (save in their own inner conscience), 88 per cent. of the graduates of last year were boys, while from those in charge of fussy, fidgety, elderly, nervous, uniterary, unscientific old women, destitute of culture or broad ideas, but with a good political pull, 43 per cent. of the graduates were boys. The twelve largest grammar-schools of Chicago have an attendance of 1,500 pupils and upwards; six of these have a man at the helm, 38½ per cent. of whose graduates were boys, while the other six, towed along by these same old women, with enfeebled bodies and uncultured minds, graduated classes of which 45 per cent. were boys. In ten grammar-schools more boys than girls completed the course; six of these were in charge of women, four of men. The school which graduated the largest percentage of boys, 60 per cent., was in charge of a woman. The school presided over by the gentleman whom the Democrats honored with the nomination for County Superintendent, and who stands admittedly high in his profession, graduated one boy and fifteen girls.

Now, if these facts prove anything, they prove that women as principals of large schools are much more successful than men in keeping boys in school. I do not believe, however, that they prove anything except that sex cuts a very small figure in the public schools. I believe in equal rights, and that half of the positions should be open to men, if they desire them, from the highest down to the lowest, with like salaries for like work; and my mind, though it may be narrow and contracted, is broad enough to grasp the fact that not all the virtues are concentrated in either sex, and that it is not a sign of growth to cling to the old customs and prejudices of a hundred years ago when we may live in the light and progress of the nineteenth century.

MARY DARROW-OLSON.

CHICAGO, September 1, 1892.

COLORADO'S SHARE OF PROTECTION.

TO THE EDITOR OF THE NATION:

SIR: To your editorial on "Riot and Protection," in your issue of August 25, you might have added another instance of protection as an influence working for a confusion bordering on riot in our finances and currency. I refer to the moral support which the Colorado mine-owners find in protection for their free-coinage-of-silver issue. It was the frequent statement which I met with from ex-Republicans of Colorado, in a recent visit to that State, that they had voted to protect the Eastern manufacturer and to pay a bounty to the Southern sugar-grower long enough, and now the manufacturer and sugar-grower must concede to their great industry the only protection which would benefit it, viz., the free coinage of silver, or forfeit all claim to their support now and in the future. And why not? Certainly if Government aids one industry, it should aid others in their need. There is no logical answer that can be made by a protectionist any more than there is to the suggestion in your editorial of protecting the home labor market by a tax on imported labor. Both would be dangerous experiments, and both are the logical offspring of a system of paternalism the evil consequences of which as a precedent for such suggestions cannot be estimated.

Colorado will be carried by the Weaver party.—Yours, etc., M. D. HULL.

CHICAGO, September 1, 1892.

ART FALLEN AMONG CUSTOMS APPRAISERS.

TO THE EDITOR OF THE NATION:

SIR: In 1888 I was commissioned to visit Paris to select a sculptor to model a crucifix intended to be part of a monument designed for the chapel of a religious institution in this city. The monument is in memory of a gentleman distinguished for his charities. The sculptor selected undertook to model a life-size figure, to be cast in bronze. The figure was to be attached to a bronze cross, also cast, and in connection with this work he also overlooked the modelling and casting of two large inscription plates to be attached to the monument.

The monument proper is a wall tablet of terracotta which was made in this city. The cross and tablets were cast by a noted bronze founder, Gruet, in Paris, under the sculptor's direction, models for them having been previously prepared from my own drawings. Various occurrences delayed the sculptor, an American, in his work on the figure for the crucifix, which was subsequently modelled and cast in America, the cross and tablets remaining in Paris. When the monument was finally about to be erected, the cross and tablets were sent from Paris by way of New York, where they were detained in the Custom-house. Duty of 45 per cent. was paid under protest for their release. On appealing from the Collector to the Honorable Board of General Appraisers, praying for a rebate of the duty, it was shown that the goods are in themselves works of art having been designed as such, and also as forming part of a monument which could come under no other definition than that of a "work of art." Two artists of this city, one of them distinguished by world-wide reputation, made statements that in their judgment these goods are "works of art." Photographs of the finished monument, showing the cross and tablets in position, were submitted for the inspection of the Honorable Board. As "works of art," "to be presented to a religious institution," I understand the law would allow them entry free. As mere "casts in bronze," I believe they should have been admitted free. The Honorable Board of General Appraisers decide they are not "works of art," and are not "casts in bronze," and refuse to refund the duty paid.

My client can afford the amount of the duty, $217.35, better than many people, and the principle involved is of more importance than the money. The arbitrary power of the customs authorities seems to reach beyond wisdom and to be incapable of enlightenment from ordinary sources. I have characterized their judgment in this case as being neither intelligent nor just. I think it is open to more severe criticism.—Yours respectfully,

A. W. S.

PHILADELPHIA, September 1, 1892.

Notes.

THE fall announcements of Houghton, Mifflin & Co. include 'Three Episodes in Massachusetts History'—viz., the Bay settlement, the Antinomian controversy, and town development (1640-1890)—by Charles Francis Adams; 'Essays, Historical and Political,' by Henry Cabot Lodge; 'The Army of Northern Virginia [Confederate] in 1862,' by the late Col. William Allan; 'The Southern Empire,' three essays, speculative, political, and historical, by Oliver T. Morton, son of the late Senator Morton; 'France under the Regency,' by James Breck Perkins; 'The Eve of the French Revolution,' by Edward J. Lowell; a third edition of Edward Stanwood's 'History of Presidential Elections,' brought down to date; 'The Story of Mary Washington,' by Marion Harland; 'The Life and Writings of Jared Sparks,' in two volumes, by Prof. Herbert B. Adams; W. G. Collingwood's 'John Ruskin: His Life and Work'; 'Cæsar,' by Col. Theodore A. Dodge, in his series of "Great Captains"; 'The Nature and Elements of Poetry,' being the first lectures given on the Turnbull Foundation of Poetry at Johns Hopkins, by Edmund C. Stedman; 'The Complete Poetical Works of Shelley,' in four volumes, edited with a memoir and descriptive notes by Prof. George E. Woodberry; 'A Book of Famous Verse,' selected for young people by Agnes Repplier; 'Little Folk Lyrics,' by Frank Dempster Sherman; 'The Song of the Ancient People,' by Edna Dean Proctor; 'Songs of Sunrise Lands,' by Clinton Scollard; 'Prose Idyls,' by John Albee; 'The

Footpath Way,' by Bradford Torrey; 'Autumn,' a new gleaning from the journals of Thoreau, edited by H. G. O. Blake; 'Japan,' a compact history, by the Rev. W. E. Griffis; 'An American Missionary in Japan,' by M. L. Gordon, M.D.; 'Pagan and Christian Rome,' by R. Lanciani; 'The Old English Dramatists,' by James Russell Lowell; 'Uncle Remus and his Friends,' by Joel Chandler Harris; 'The Interpretation of Nature,' by Prof. N. S. Shaler; 'The Creation of the Bible,' by the Rev. Myron Adams; and 'Favorite Flies and their History,' an illustrated book for anglers, by Mary E. Orvis Marbury.

Macmillan & Co. hope to have Mr. Bryce's latest edition of his 'American Commonwealth' ready by October 1. They also announce 'The Beauties of Nature and the Wonders of the World,' by Sir John Lubbock; and a 'History of Early English Literature,' by the Rev. Stopford A. Brooke.

The Scribners have in press 'The Campaign of Waterloo,' by John C. Ropes, with an atlas; 'Spanish Cities,' by Dr. Charles A. Stoddard; 'Poems of Rod and Gun,' by Ernest McGaffey, illustrated by Herbert Butler; and the complete Poems of Mrs. Julia C. R. Dorr.

Roberts Brothers have nearly ready the complete Poems of Philip Bourke Marston, edited by Mrs. Louise Chandler Moulton.

'Echoes from the Sabine Farm,' translations from Horace's lyrics by Eugene and Roswell M. Field, will be published by A. C. McClurg & Co., with illustrations by Garrett.

Harper & Bros. will issue 'A Tour around New York and My Summer Acre,' by Felix Oldboy, and the following other illustrated volumes: Curtis's 'Prue and I'; James's 'Daisy Miller' and 'An International Episode'; 'A Little Swiss Sojourn,' by W. D. Howells; 'Along New England Roads,' by W. C. Prime; 'The West from a Car Window,' by Richard Harding Davis; 'The Praise of Paris,' studies of the French capital; and 'London,' by Walter Besant.

D. C. Heath & Co., Boston, will shortly bring out the First Part of "Faust," edited with notes and a bibliography by Prof. Calvin Thomas of the University of Michigan.

M. Alphonse Daudet, the French papers say, is just now engaged in putting the last touches on his new novel, which is to be called 'Soutien de Famille.' Unless the reports of its plot and of his treatment of it which have been given out are all wrong, there seems to be but little likelihood that it will prove to be any such work as the 'Nabab' was, or 'Numa Roumestan,' or the 'Rois en Exil.' After this book is finished Daudet proposes, it is said, to undertake the translation of the 'Mémoires d'un Valet de ferme,' a book in the Provençal dialect, written by a peasant named Baptiste Bonnet. These memoirs are much read in the villages of Provence.

Quite recently—on the 19th of August, to be exact—M. Émile Zola was seen, to the surprise of some observers, on a railway train that was conveying six or seven hundred priests and laymen and sick people, all pilgrims, to the shrine at Lourdes. It was thought, naturally, that he was making a collection of human documents for his next novel, 'Docteur Pascal.' But it was for a novel which he means to begin immediately after the appearance of that romance that he was "documenting himself," as he told a reporter. 'Docteur Pascal' will appear in April next, and at that time M. Zola will be free to set about a work in which he will have occasion to speak of Lourdes.

The *Temps* announces that Ibsen's new play will be published towards the end of the year. Current talk in Copenhagen says that the appearance of this work will excite a certain sensational interest, inasmuch as its tone is quite other than that of its author's previous writings. Gay satire is its dominant note. The scene is laid at Copenhagen, and many well-known personages, political, artistic, financial, will figure in it—"une pièce à clef, en un mot."

The consular reports and other economic publications of Mr. Jacob Schoenhof have marked him as an acute and thorough investigator of the questions related to cost of production; and his latest volume, 'The Economy of High Wages' (Putnams), has the merit not only of painstaking and intelligent research, but of great timeliness from the political point of view. Its main aim is to go behind the crude though taking assertion that a surface difference in wages argues an equal difference in cost of production and of competing power, and to show by careful comparisons and a great range of facts gathered at first hand, that high wages not only are consistent with low cost of production, but generally cause it. There is the less need to give a detailed review of the book in that it is certain to be an arsenal for tariff-reformers in the next two months, and so to be widely read and quoted.

Mary Wollstonecraft's 'Vindication of the Rights of Women' opens a handy series to be called "The Scott Library" (London: Walter Scott; New York: A. Lovell Co.). It is provided with a preface by an American, Mrs. Elizabeth Robins Pennell. Companion volumes in the same series on our table are Heine's 'Italian Travel Sketches, etc.,' translated by Elizabeth A. Sharp; 'Essays by Sainte-Beuve,' translated by Elizabeth Lee; 'Selections from Plato,' revised upon Sydenham and Taylor by T. W. Rolleston; and 'The *Athenian Oracle*; a Selection,' edited by John Underhill. We can do no more than bespeak attention to this excellent and attractive collection and the continuation of it.

'The Chetwynds of Ingestre,' by H. E. Chetwynd-Stapylton (Longmans, Green & Co.), is a readable history, in 264 pages, of an English family for several centuries. Originally settled at Chetwind, Co. Salop, as early as A.D. 1180, the oldest branch died out in the early part of the fifteenth century, while a younger branch at Ingestre, Co. Stafford, maintained the family honors. Some fourteen generations of the name held Ingestre and Grendon, but in 1692 the line ended with Walter Chetwynd, the antiquary. Grendon, Co. Warwick, went to a junior line, now become baronets, and recorded by Shirley in his 'Noble and Gentle Men.' Ingestre passed to a still more remote line settled at Rudge, and soon ennobled in 1717 as Viscounts Chetwynd in the peerage of Ireland. The daughter of the second peer carried Ingestre to the Talbot family, though the title exists in the male line. The family is distinctly one of high rank among the gentry of England, yet we fail to discover a single member thereof of any especial force or attainments. The history is interesting and yet unsatisfactory, inasmuch as the author fails to use the material evidently attainable. A good antiquary would have made a valuable book out of the family papers; a skilful writer would at least have made us realize more fully some of the romantic episodes of the family history. Possibly, however, English reserve and traditions are to be blamed for the reticence of the editor.

'The History of Boxley Parish, Kent,' by J. Cave-Browne (Maidstone, Eng.: E. J. Dickinson), contains little to interest any but local readers. Boxley Abbey, indeed, has obtained an undesirable notoriety on account of its juggling "Rood of Grace," or crucifix, which was noted for miraculous movements of the eyes and other features. The exposure of the fraud was one of the excuses for the abolition of monasteries by Henry VIII., and the historian sets forth the story in some detail. The Wiat family held part of the Abbey lands for two generations, but no other names of note seem to be associated with the vicinity, unless we except that of George Sandys, the poet, who often visited here his niece Margaret, the wife of Sir Francis Wiat, Governor of Virginia. The book contains some extracts from the parish registers, but we fail to notice any names which have been reproduced on this side of the Atlantic.

Among the publications of the Gesellschaft für vervielfältigende Kunst in Vienna, the fifth instalment of Dr. Rosenberg's 'The Rubens Etchers' has just appeared. The text, by the editor, Prof. Dr. C. von Luetzow, treats exhaustively of the three chief masters of the famous school of etching, Paulus Pontius, Boetius, and Schelte a Bolswert. The works of these men are exemplified by a number of able illustrations and by four full-page reproductions of etchings by Pontius. There are also two heliogravures of leaflets by Chr. Jeghers and P. Witdock. Two more instalments of 'The Rubens Etchers' are to follow.

Students of Dante will be interested in 'Luca Signorelli's Illustrationen zu Dante's Divina Commedia,' now published for the first time with explanatory text by Franz Haver Kraus (Freiburg: Mohr). Signorelli's frescoes on the walls of the Capella della Madonna di San Brizio in the Cathedral of Orvieto represent scenes from the Last Judgment. Their importance for the history of painting in the early Renaissance period and for the influence of Dante on art can scarcely be overestimated. This reproduction of them in twelve plates by the process of photogravure is admirable, and forms the first of a series of similar publications in illustration of the 'Divine Comedy' which Herr Kraus intends to issue.

The opening article in the August Proceedings of the Royal Geographical Society is an account of an expedition made by officers of the British East Africa Company for the purpose of ascertaining the navigability of the River Tana. They succeeded in taking up a steamer for some 360 miles, though with great difficulty, from causes common to all tropical streams. Much of the country along the banks was rich land and especially adapted for the cultivation of rice; but all agriculture was greatly checked by the constant raids of the Masai and other warlike tribes. Some Gallas, who had been forced by them to take refuge on an island, gave as a reason for the loss of their former power the swallowing by an ox of the book which God gave them at creation containing his orders, and which was carelessly left lying about. "Hence a custom which is now observed of opening and examining the entrails of any ox that dies or is killed for food, in the hopes of recovering the lost book, for if they could once more regain possession of it, they believe they would again become the most powerful nation on earth." An attempt was made to ascend Mount Kenia, which failed apparently from want of time. An account of an expedition to a mountain in the interior of the Malay Peninsula, hitherto unvisited by Europeans, tells also of non-success. Arabian coffee-trees were found, but the rajah in whose garden they were cultivated "was totally ignorant of the use of the coffee-berries, using the leaves only to make tea of."

Before the outbreak of the cholera, the citizens of Hamburg were organizing a Columbus celebration to be held in October, at which

there were to be meetings to be addressed by delegates from all the German universities and the geographical societies; and an exhibition of books, maps, globes, nautical instruments, and other things in use at the period of the discovery of America, as well as objects illustrating the present-day development of America, modern pictures, books, and charts. It was also proposed to publish a memorial volume containing papers on early German transatlantic trade.

About 1,087 volumes of the private library of Dr. Nicolas Léon, formerly director of the Museum at Morelia, are for sale. They embrace publications of special value for Mexicologists, many very scarce and several unique, together with manuscripts on the history of Michoacán and other Mexican States, on the Tarasco (the Indian language of Michoacán), etc. Parties interested should correspond with Dr. Léon, No 16 Portal de Matamoros, Morelia, Mexico.

—At the meeting of the American Economic Association held at Chautauqua in the last week of August, President Francis A. Walker, who had been President from the organization of the Association, resigned his office, and was succeeded by Prof. Dunbar of Harvard University. Prof. Ely, who had filled the office of Secretary with indefatigable assiduity, also resigned, and was succeeded by Prof. Ross of Cornell. The change in officers marked no change in the character or policy, and yet was significant, emphasizing as it did the catholic nature of the association, and the union in its ranks, for the promotion of calm and unbiassed study of economic phenomena, of economists of all shades of thought. In no department of knowledge has American scholarship made a more striking advance in the last ten years than it has in economics, and it is fortunate that the writers and teachers who have achieved this change have united, irrespective of some important differences in opinion, for the promotion of thorough and scholarly work. At the August meeting, papers were presented, among others, by Prof. Patten, on some aspects of Ricardo's work; by Profs. Clark and Giddings, on the theory of value; by Prof. Taussig, on value and distribution as discussed in Marshall's recent book; and by Prof. Seligman, on progressive taxation. Not the least interesting contribution to the discussions was an essay, of a more popular sort, on the endowment-society craze, by Mr. F. P. Bennett of Massachusetts, to which the collapse of the Iron Hall, announced in the daily papers at the very time of the meeting, gave a dramatic emphasis. We are glad to take this opportunity of commending the Association to all public-spirited persons who wish to aid in promoting the advance of economic science. Its publications are sent to all members. Applications for membership should be addressed to the Secretary, Prof. Ross, at Ithaca, N. Y.

—Rarely have the summer meetings of scientific associations, home or foreign, produced anything to equal the admirable and scholarly address of Sir Archibald Geikie, President of the British Association for the Advancement of Science, at Edinburgh, August 3. The centenary of James Hutton's 'Theory of the Earth' suggested the subject, one in which the Scottish geologists have ever been well to the front. Our space forbids that ample citation which we should like, but Sir Archibald's treatment of the time-contest between astronomer and geologist is peculiarly felicitous. Among the debts, he says, which science owes to the Huttonian school, not the least memorable is the promulgation of the first well-founded conceptions of the high antiquity of the globe. Previously some 6,000 years had been believed to comprise the whole life of the planet, and indeed of the entire universe. Astronomy had made known the immeasurable fields of space; the new geology seemed then to reveal boundless distances in time; the whole of bygone eternity lay open to the requirements of the geologist. Playfair, reëchoing and expanding Hutton's language, had declared that neither among the records of the earth nor in the planetary motions could any trace be discovered of the beginning or of the end of the present order of things, and that no symptom of infancy or of old age appeared on the face of Nature. Then came Sir William Thomson to point out that these conceptions were fundamentally erroneous, that every lineament of the solar system bears witness to a gradual dissipation of energy from some definite starting-point. It is not a pleasant experience to discover that a fortune which one has unconcernedly believed to be ample, has somehow taken to itself wings and disappeared. When the geologist was suddenly awakened by the energetic warning of the physicist, who assured him that he had enormously overdrawn his account with past time, it was but natural under the circumstances that he should think the accountant to be mistaken who thus returned to him dishonored the large drafts he had made upon eternity. He saw how wide were the limits of time deducible from physical considerations, how vague the data from which they had been calculated. And though he could not help admitting that a limit must be fixed beyond which his chronology could not be extended, he consoled himself with the reflection that, after all, a hundred millions of years was a tolerably ample period of time, and might possibly have been quite sufficient for the transaction of all the prolonged sequence of events recorded in the crust of the earth. He was therefore disposed to acquiesce in the limitation thus imposed upon geological history.

—But physical inquiry continued to be pushed forward with regard to the early history and the antiquity of the earth. Further consideration of the influence of tidal friction in retarding the earth's rotation, and of the sun's rate of cooling, led to sweeping reductions of the time allowable for the evolution of the planet. The geologist found himself in the plight of *Lear* when his bodyguard of one hundred knights was cut down. "What need you five-and-twenty, ten, or five?" demands the inexorable physicist, as he remorselessly strikes slice after slice from his allowance of geologic time. Lord Kelvin is willing to grant the geologists some twenty millions of years, but Prof. Tait would have them content with less than ten millions. Dr. Geikie frankly confesses that the demands of the early geologists for an unlimited series of ages were extravagant, and even for their own purposes unnecessary, and thinks the physicists have done good service in reducing them. Also, he will freely admit that the latest conclusions, from physical considerations, of the extent of geological time require that the interpretation given to the record of the rocks should be rigorously revised, with the view of ascertaining how far that interpretation may be capable of modification or amendment. Still, it is also to be remembered that the geological record constitutes a voluminous body of evidence regarding the earth's history which cannot be ignored, and must be explained in accordance with ascertained natural laws. If the conclusions derived from the most careful study of this record cannot be reconciled with those drawn from physical considerations, it is surely not too much to ask that the latter should be also revised. It has been well said that the mathematical mill is an admirable piece of machinery, but that the value of what it yields depends upon the quality of what is put into it. That there must be some flaw in the physical argument, Sir Archibald can hardly doubt, though he does not pretend to be able to say where it is to be found.

—In accordance with a resolution adopted by the International Congress of Criminalists, held last year at Christiania, a work entitled 'Die Strafgesetzgebung der Gegenwart in rechtsvergleichender Darstellung' is now in preparation, and will be published in five vollumes by Otto Liebmann at Berlin. It will consist of treatises on the penal legislation of the principal countries of the world by recognized authorities in the province of jurisprudence, such as Van Hamel of Amsterdam, Gauckler of Caen, Stross of Berne, Prins of Brussels, Lamasch of Vienna, and Von Liszt of Halle, to whom the editorship of the work has been committed. It will be issued also in French. Among the papers read before the Congress for Criminal Anthropology which convened on August 7, at Brussels, was one on "Les Crimes des Foules," by a French judge, M. Tarde, from Sarlat in Dordogne. The subject is invested with peculiar interest at the present time, and finds ample illustration in the daily chronicles of current events as well as in the records of history. M. Tarde comes to the conclusion that "la foule, parmi les populations les plus civilisées, est toujours une sauvagesse et une faunesse, moins que cela une bête impulsive et maniaque." Persons who combine for the accomplishment of even the worthiest purpose are easily led to set at defiance the simplest principles of morality and justice in order to attain the object of their desire. Corporations have proverbially no souls, and crowds animated by a common selfish impulse are apt to divest themselves of all ideal motives and natural sympathies, and degenerate ethically into a brutal mob. "L'égoisme collectif est plus intense mille fois et plus impérieux que les égoismes privés synthétisés en lui." M. Tarde applies this principle to nations, and adduces England as an illustration. "The individual Englishman is honorable, open and magnanimous; the English nation is less so." He refers also to the German Peasants' War of 1525 and the terrors of the French Revolution. But there was no need of going so far back for examples, which may be found much nearer in the atrocities recently perpetrated by Homestead rioters and murderous miners in Idaho, and in the utter disregard shown by labor associations for the rights of the laborer outside of their own organization. The same tendency manifests itself also in political parties, whose members, although personally upright and wholly truthful and trustworthy in private life, extenuate and endorse the most rascally measures taken for the success of "the cause." They go with their party into whatever sloughs it may lead them, and let their individual ethics fall into abeyance.

—Vol. xiii. of the *Goethe-Jahrbuch* opens with a curious and hitherto unknown essay composed by Goethe—as the editor thinks—in 1793-5, and entitled "Proposal for the Introduction of the German Language into Poland." The poet's scheme was, in brief, to provide a

number of itinerant dramatic companies that should play for a short time each year in all the principal cities of the land, their *répertoire* to be regulated by Government and to consist of short pieces reflecting the daily life and speech of the common people. Among the new letters published are two from the Baroness Elise von Türckheim, *née* Schönemann, to whom, in his early manhood, Goethe was engaged to be married. They date from 1801 and 1807. One asks Goethe's aid in securing a place for a young man whom Frau von Türckheim had befriended, the other introduces her sons. Incidentally the letters testify to the high regard in which the Baroness held her quondam lover. How far she was from blaming him for the rupture of their youthful engagement appears from a passage in another letter published in the *Jahrbuch*—a letter of Barbara Schulthess to Goethe, written in 1794 or 1795. In this the writer says that she has just made the acquaintance of Lise Türckheim, who had this to say of her former lover: "I send him greeting. In thinking of him I delight to keep in my soul the pure image which he left there by his conduct toward me. I shall not let it be effaced by anything that can be said to me." Notices like this only emphasize a fact long known to the well-informed, viz., that that important and much discussed chapter in Goethe's life which deals with his relations to women, can no longer be based upon 'Dichtung und Wahrheit,' but needs to be radically revised in the light of contemporary documents. The present trend of German "Goethe-philology" is well indicated by the character of the essays in the newest *Jahrbuch*. They are five in number and all intensely matter-of-fact. The first is devoted to the personal relations of Goethe and his Swiss friend Barbara Schulthess, and the second to a long account (based partly on new matter in the archives) of Goethe's studies in anatomy. The third endeavors, with no very striking success, to find traces of the Song of Solomon in "Faust"; the fourth tries to demonstrate the influence of the Dutch Neo-Latin poet Johannes Secundus upon Goethe's erotic elegies; while the last discusses the history of Goethe's Frankfort citizenship and the formalities connected with his abandonment of it in 1817. The department of bibliography has grown so large that the editor complains of being unable to manage it; so he gives only sixty pages of matter under this head and omits the remainder for lack of space.

A NATION-MAKER.

The Life and Times of Sir George Grey, K.C.B. By William Lee Rees and Lily Rees. Auckland, New Zealand: H. Brett. 1892.

Our absorption in ourselves leaves us little time to attend to what goes on in remote parts of the world, even in countries where a common origin, language, institutions, and general spirit ought to arouse sympathy. Here is a biography in which is summed up in a remarkable way the story of the development of that great society of English-speaking men, 5,000,000 strong, which has been established almost during the Victorian age in the South Pacific. The record is most picturesque and full of interest for Americans. Sir George Grey, beginning his career in 1837 as one of the boldest of Australian explorers, becoming afterwards Governor of South Australia, twice Governor of Cape Colony, and twice Governor of New Zealand, still lives, an octogenarian almost as vigorous as Gladstone, to play a part in the federation of Australasia, and the setting in order of that great brotherhood of provinces for the work of the twentieth century.

Born in Lisbon in 1812, a few days after his father, Colonel of the Thirty-third Regiment, had been killed at the head of the storming party in the breach at Badajos, George Grey, too, became a soldier, after a brilliant career at Sandhurst receiving a lieutenancy, and departing in the year of Victoria's accession with a commission to explore northwestern Australia. Here the harshest obstacles were encountered—deserts, jungles, rugged coasts—now thirst, now tropical cloud-bursts, which brought the party to death's door. But nothing is finer in the account than Grey's wise and humane dealing with the natives whom he encountered; he struck here into methods which he followed in a most notable way through life, becoming at last one of the most successful tamers of savage men whom the world has seen. His desire was not to destroy even though his life were imperilled, but to lift up. His followers, with apparent good reason, thought him quixotic when he lamented the death of a chief whom he shot at the moment when the savage's spear had nearly taken his own life; when he ordered his men to leave untouched a hostile party's weapons which might have been seized; and when he forbade them, almost starving, to take from the stores of the natives more than enough to satisfy the present necessity. In the sequel, however, the expediency as well as the humanity of Grey's policy was abundantly demonstrated, as in many similar cases in his later career upon larger fields.

Leaving the scene of his explorations, which has since become a cultivated and populous tract, Grey, twenty-eight years old, was made in 1841 Governor of South Australia, then the youngest colony of England, he being the youngest man ever put into such a position. His difficulties here were not less than in his previous exploit, though different in kind. The virgin province was in danger of falling into the hands of land monopolists, against whom the young Governor stubbornly set himself, striking here, too, a keynote with which his future life was to harmonize in arenas far distant and much wider. The rapacious crowd were foiled; the State Church they had contemplated, the extensive revenues for which were to flow in great part from taxes paid by dissenters, came to naught; instead of a dependent working-class who, according to the plan, were to furnish an abundance of cheap labor with no opportunity to rise into independent proprietorship, a society appeared in which each man lived on his own moderate holding, after the type of the ancient English yeoman and the New England farmer of a later time.

Grey was opposed violently, both in the colony and by the Home Government, but his power was recognized; and when in 1845 a wise and firm hand became indispensable in New Zealand, he was transferred thither, finding in that magnificent province, nearly as large as Italy and abounding in the finest resources, a noble opportunity. Leaving behind him peace and content among the South Australian colonists, while the natives, few though they were in the scale, were slowly rising through the influence of firmness and kindness, he turned to confront in his new province a turmoil far greater than he had thus far coped with. The same land-grabbing was rife which had so nearly blighted South Australia; a feudal order was in process of formation, with lordly proprietors and a State Church on one side and on the other a mass of dependent laborers; at the same time a new element of danger was at hand—the presence of a native race, the Maoris, perhaps the most formidable barbarians in the world. Aggression and injustice had provoked the Maoris to war; the eight or ten thousand English colonists were, at Grey's arrival, in imminent danger of being "at supper" with 120,000 cannibals after the fashion of *Polonius* with the worms when *Hamlet's* thrust had done its work. It all happened in an out-of-the-way corner of the world, but it is a shame that the story of the manner in which Grey set his difficult viceroyalty in order should not be known to all English-speaking men. With deft blending of force and forbearance, the tribes were subdued and won at last to enthusiastic friendship. Many a picturesque adventure is narrated as the Governor, sometimes alone, sometimes with some kindred spirit, like the consecrated Bishop Selwyn, penetrated to the fastnesses of the grim tattooed chiefs, subduing their hearts with no weapons but humanity and justice. With similar tact and courage the colonists were guided; opportunities were opened to the poor; in 1852 a thoroughly democratic constitution went into operation, which fifteen years later was copied substantially for federated Canada. Grey was beset with opposition in his province and in Downing Street. Quixotic, visionary, impracticable were adjectives always coupled with his name; but somehow his rashness and folly rarely failed of success. His enemies, silenced, often were forced to adopt his measures which they had once ridiculed. He was knighted in 1848; but it was in 1853 that his career received its most emphatic vindication, though it was grotesque enough. On a visit to England in that year, Oxford conferred upon him the degree of D.C.L., while 2,000 undergraduates responded to the Latin eulogy in which his exploits were recounted, by roaring at the tops of their voices, "The King of the Cannibal Islands."

South Africa was now in great straits, and Downing Street, with much hesitation, felt at last that no one was likely to deal with the problem better than the organizer of South Australia and New Zealand. Colonized in the seventeenth century by Dutch and Huguenots, South Africa was ceded to England in 1814, during the forty years subsequent to which date it had been constantly harassed by troubles with Boers and natives. The Government, at their wits' end with embarrassments, were about prepared to resign everything but Cape Town and Table Bay. At this point Sir George Grey was despatched thither with powers almost autocratic. The story of his proconsulship is but a repetition on a larger scale of his preceding administrations. In the main, the same problems were dealt with by the same expedients. The presence of the Boers, indeed, an alien European population, among the colonists, caused a new complication, in managing which Grey was helped by the fact that there was a Huguenot strain in his own ancestry. Here, however, were Basutos, Kaffirs, and Zulus, native races scarcely less formidable than the Maoris, outraged by the aggression and injustice of European intruders; here also were rapacious monopolists; and over against them a mass of Englishmen in danger of falling into semi-serfdom. Grey's success was complete. He could be a soldier on occasion, as when, in a general Kaffir uprising, he corralled by a ruse all the principal chiefs, bringing the war to a sudden and almost bloodless end. But his weapons

were for the most part schools, hospitals, and courts where equal justice was meted. At the same time, securing in the territories a population of small proprietors, he constituted a thoroughly democratic order.

At the outbreak of the Indian Mutiny, by diverting on his own responsibility to Calcutta troops destined for China, and by sending at the same time from his own province every soldier and every gun, he perhaps saved India to England. In this crisis he took a most extraordinary and characteristic course with the natives, which on the face of it seemed like folly itself, but in the result was brilliantly justified. So far from trying to conceal the circumstances from savages lately in fiercest war with the English, he explained to their chiefs with perfect frankness the whole situation, stating his own helplessness, the straits to which the Empire was reduced, and throwing himself upon their honor and good will. The painted and feathered dignitaries pledged to him hearty support, and not one departed from his word. Peace reigned in South Africa until his policy was abandoned; then came wars in which 30,000 lives were sacrificed, and names like Isandula and Majuba Hill were added to the days of disaster in British story. "No Roman proconsul," says his biography, "wielded power over wider dominions or was brought into contact with wilder nations. No man ever subdued with so little bloodshed such great numbers of barbarians."

Nevertheless Grey was disapproved. He was a dreamer, disobedient to instructions, a contriver of impossible policies, altogether a dangerous man. He was removed from South Africa, only to be sent back again, however, before he could land in England. His ways were so radical and absurd, but how well things turned out, after all! Canada was promised him; Sir Charles Napier said he should have been sent to India instead of Lord Mayo. New Zealand, however, was again wrapped in blood and flame because his methods had been forgotten, and only he could be trusted to restore order. Once more he laid hand to the task, but only to be curtly dismissed. The administrative work which has caused him to be known in the South Pacific as the "Great Proconsul" came to an end in 1867. As regards the colonists, they have been peaceful and happy only as his policy has been followed; as regards the natives, what he did may be judged from the grateful outburst of Florence Nightingale: "God bless you! I wish I could have helped you more. You are nearly the only Governor except the great and good Sir John Lawrence, who have condescended to qualify yourself by learning the language, the physical habits, and the ethnological peculiarities of the races you have had to govern. God bless you for all you have done for those fine races!"

Though no longer a Viceroy, Grey was still in public life. Returning to England, his ability and character were universally recognized; the Tories even, with Disraeli at their head, making flattering overtures in the hope to gain him. He was, however, too liberal even for the Liberals, going so far in 1869 as to advocate home rule, formulating in October of that year "the first definite and practicable proposition ever made for the local self-government of Ireland." In this he was strenuously opposed not only by Lord Granville and John Bright, but also by Gladstone. The truth was that Grey, in his long and widely extended experience with rising States, had conceived the idea of a great federation of English-speaking lands, in which idea he went so far as to include even the United States, anticipating a brotherhood in which America, by virtue of power and numbers, should hold the leading place. For some such consummation in the future the world, in his thought, even now must be set in order. He was in this far before his time. In those days the "dismemberment policy" was in favor—that Britain must cast off her colonies. He failed of election to Parliament, and was stigmatized by men who within twenty years were to adopt, in great part, his views. He did not quite fail, however, of appreciation. Said Carlyle: "He is born of the Tetragonidæ, built four-square, solid, as one fitted strongly to meet the winds of Heaven and the waves of Fate."

Grey returned to New Zealand, not to the retirement which his years justified, but, like John Quincy Adams, to struggle, as a simple delegate in the lower house, for the principles he had upheld in the chief position of the State. His last noteworthy appearance in public life was at the convention for formulating a federal constitution for Australasia, held at Sydney in the spring of 1891. The outcome was little to his taste, for the instrument preserved such aristocratic features as "plural voting," a device by which a rich proprietor might cast his ballot fifteen or twenty times if his estates were numerous and scattered; and also, instead of providing for the election of the supreme magistrate by the people, contemplated the appointment by the Crown of some high-born Englishman. The old cries of "visionary, impracticable" were once more raised against him, and in the convention he stood almost alone. No sooner was it dissolved, however, than, while making a tour of the Australian provinces, the people came everywhere to meet him. In each city and town he addressed enthusiastic thousands, and it became plain that if the federation of Australia was ever to occur, it must be upon his lines.

No man of our time better deserves the title of nation maker than Sir George Grey; and there are few careers which anticipate to the extent which his career has done, what we may fairly hope will be the spirit of the twentieth century.

China Collecting in America. By Alice Morse Earle. Illustrated. Charles Scribner's Sons. 1892.

THIS is a first-rate book of its kind. It is written in a flowing, easy style that holds in cheerful solution a goodly number of facts industriously gathered and used with judgment. Several of the subjects treated in these chapters have been written about by others, but no one, we believe, has, thus far, brought the whole matter at once so completely and so comfortably under one roof as has been done by Mrs. Earle. The hard-hearted critic may now and then be led, in the opening pages, to ask whether the lady do not protest too much, and work herself up into a fine state of adjectivity about what, at best, must be allowed little more than another of the many modern devices "to make tedious hours believe we think not of them." But this objection is sure to make itself felt less and less as we read further, until, on closing the book, we find that we have obtained from its pages one more clear and spirited picture of the social life of our "old colonial times."

The aim of the book is, however, scientific (if that be not too large a word) rather than to add to the amusement of the hour. It proposes an account of the introduction of china into our country, and of its use on the tables of Americans, from the time of its first employment as a substitute for wooden bowls and trenchers and for pewter ware. The word "china" is conveniently used by the author, as is the common practice, to include stoneware, earthenware, and porcelain; but, in the detailed treatment of the subject, the distinctions are, of course, clearly kept in view. The chapters on "Early Fictile Art in America," and "Earliest Pottery Wares," on "Liverpool Ware" and "Oriental China," with that on "Punch Bowls and Punches," will be found pleasant reading, we should think, whether one cares about the matter or not; and they add considerably to our knowledge of the subject. There is a whole chapter on punch-bowls and their contents, without a word of apology or so much as a hint of deprecation. In fact, there is a certain gusto on the lady's part in discussing the subject which, when considered along with her true womanly appreciation of the delights of tea-drinking, as shown in the chapter on "The Cosey Tea-pot," proves her to be well fitted by nature for an all-round treatment of her subject.

Mrs. Earle would not be a china-collector of the true breed were she to stand quietly by when a fight is going on, nor long to take a hand in it. On the contrary, she smells the battle from afar, and runs half-way to meet it. But a fairer foe was never in the field, as all will admit who have read her chapter on "Oriental China," where she discusses the "Lowestoft question," and, to the satisfaction of one of her readers at least, settles it in favor of the Chinese origin of that ware. This, however, is less to our purpose than the illustration it gives of the author's method of getting at the facts in the matter she is discussing. Her aim is the truth.

So industrious a student might have made her book much longer, no doubt, had she not been mindful of the French saying that there is no better way to be tiresome than to tell all you know. Mrs. Earle is never tiresome. She is so humorously interested in her subject, showing us that she knows well enough how far it is worth while to be interested in it; she is so ready to enjoy a legend or a myth and to let you enjoy it even after she has proved it unbelievable; she so cheerfully resigns herself to the hardships and disappointments always lying in wait for the explorer, that, out of a subject which in another's hands might have proved dry and unfruitful, she has made a valuable and entertaining contribution to the history of small things without which the history of great things cannot successfully be written.

The book is prettily illustrated with process-prints taken from the objects themselves. Considering that until very lately there were but few pieces of Persian ware to be found in this country, and that even now they are rare, a more appropriate device might have been chosen for the cover than the Persian design for a plate; but the book is very attractively made. The index is rather of the haphazard order; but as the facts are well grouped in their respective chapters, the reader cannot be seriously put about in finding what he may want.

Dreams of the Dead. By Edward Stanton. Boston: Lee & Shepard. 1892.

THERE is a stage of scientific inquiry, ineluctable as the calentures of youth, whose work is pure play of fancy. The wonderful molecular theory which has served our age as master-key to the arcana of nature, would

never have come into our possession if Democritus and Epicurus had not first dreamed it. Copernicus had never dared his leap, the audacity of which we cannot easily appreciate, if he had not had Pythagorean fancies of a central fire to egg on his mind. Concerning a future life and the nature of spirit, we know about as much to-day as Democritus and Epicurus did about the cosmos. We are most of us hoping now that our descendants, at least, may some day find out in this world something positive about the other. Meantime, speculation must mew its plumage for a new flight; for it is surprising how feeble all the attempts of the Dantes and the Aquinases have been—the Aquinases vainly trusting to the flappers of ratiocination to raise them from the earth; the Dantes hampered by preconceived downdragging baggage; and both too much occupied with ideas of Hell to wing their way freely in a spiritual ether. Swedenborg might have helped us, if he had not been so positive and peremptory. Dogma weighs down; it is unsubstantial suggestions and light interrogations that are wanted to bear the mind aloft.

The author of 'Dreams of the Dead' makes no effort to persuade his reader; he insists upon nothing—he just sets forth his reveries, with an unaffected power that makes itself felt. Were the book a product of art, it would bespeak an imagination not less than extraordinary; but be it the production of a one-book man, the brooding of many years, and it is none the less valuable to the public. The author quotes on his title-page those lines of young *Hamlet*, "For in that sleepe of death, what dreames may come," etc. He has raised the thought that the dead dream, that the disintegrating brain has its flickering consciousness, and he has clothed this idea with so vivid a form that it refuses to be exorcised or shaken off. Had he argued it scientifically, as there was every temptation to do (for, after all, what solid facts are there against it?), he would have failed to impart to it such a clutch upon the imagination as he has effected by a simplicity and unpretentiousness very seductive. What an awful variation upon the purgatorial conception it is, one must read the book to know. In fact, it is too dreadful for human belief. The attractive and elevating features of the conception (and such are by no means wanting) are the ones the book mainly dwells upon; but surely no subsequent paradise could indemnify the soul for such fearful bondage to the flesh. For that reason, not many readers will be inclined to accept the theory as true. Besides, Calvinism is in ebbing favor, nowadays—some persons will call it an unsavory ebb. Now this book exhibits curious vestiges of the Calvinistic, or rather the old theological philosophy, though these are softened down till barely perceptible. Mr. Stanton does not, for instance, hold, with St. Augustine, that the honor and glory of God demand that the great majority of mankind should be predestined to everlasting fires; but he does tell with theologic glee of the misery of two old hidebound Puritans prolonged throughout two centuries. He has faith in the radical reprehensibleness of certain created spirits, which to some minds has always seemed vile blasphemy. Above all, he cannot free his conception of the other world completely from that of retributive justice, and practically postpones the Beatitudes to the comfort of another life.

Considered merely as a tale, 'Dreams of the Dead' is a story that, once read, will never be forgotten; and the lessons it impresses are not unprofitable. Any reader of it who might have been inclined to repine at the thought of mortality, will be safely cured of that complaint by the perusal, and be glad enough to adopt, if he can, the opinion of old *Prospero*, "Our revels here are ended," etc.

BOOKS OF THE WEEK.

PENNSYLVANIA, Philadelphia, Germantown, 202, 204, 335 W. Chelten Ave.

*MISS MARY E. STEVENS' BOARD-*ing and Day School.—24th year. "Approved" by Bryn Mawr College. The Bryn Mawr entrance examinations are held in the school by an examiner from the college. School certificate admits to Vassar.

PENNSYLVANIA, Philadelphia.

MISS GORDON'S BOARDING AND Day School for Young Ladies, 4110 and 4112 Spruce Street. Most delightful location in Philadelphia. 12th year opens September 21, 1892. French, Music, and College Preparatory.
Circular on application.

PENNSYLVANIA, Philadelphia, Chestnut Hill.

MISS COMEGYS AND MISS BELL'S English, French, and German Boarding-School for young ladies reopens Sept. 28.
Students prepared for college. Ample grounds for outdoor exercise.

PENNSYLVANIA, Philadelphia, 2037 De Lancey Place (formerly 2106 Spruce Street).

MISS GIBSON'S FAMILY AND DAY School for Girls. Fall term begins September 29, 1892. Home pupils limited. Preparation for College.

PENNSYLVANIA, Philadelphia, 2045 Walnut St.

*WEST WALNUT STREET SEMI-*NARY for Young Ladies. 26th Year. Is provided for giving a superior education in Collegiate, Eclectic, and Preparatory Departments; also in Music and Art. MRS. HENRIETTA KUTZ.

PENNSYLVANIA, Philadelphia, 1350 Pine St.

MISS ANABLE'S English, French, and German Boarding and Day School. 44th year.

PENNSYLVANIA, West Philadelphia.

GEORGE F. MARTIN'S SCHOOL FOR Boys Established 1882. 6 boarding pupils taken.

SOUTH DAKOTA, Sioux Falls.

*ALL SAINTS' SCHOOL.—A BOARD-*ing and Day School for Young Ladies and Children. The school has special advantages; the terms are moderate; the building has every modern convenience; Bishop Hare is at his home. The high and dry air of South Dakota proves often very salutary to those who need such a tonic. Sioux Falls may be reached by five of the great railroads of the country. For particulars address
ALL SAINTS' SCHOOL.

VERMONT, Burlington.

*VERMONT EPISCOPAL INSTI-*TUTE.—Home School for Boys. Prepares for college or business. Military drill; wholesome discipline; most beautiful and healthful location in the country. Terms, $375.
H. H. ROSS, A.M., Principal.

THE BOSTON SCHOOL OF ORATORY. —The Leading School of Expression in America. First to teach the system of Delsarte. Send for catalogue. MOSES TRUE BROWN, M.A., Boston, Mass.

*NEW YORK LAW SCHOOL, 120 Broad-*way, N. Y. City.—" Dwight method" of instruction. Degree of LL.B. given after two years' course. Graduate course now added. Tuition fee, $100. For catalogues, etc., address GEORGE CHASE, Dean.

*MISS PUTNAM, HAVING RELIN-*quished her school, will take under her protection a few young ladies who desire to prosecute their studies in the city of Boston. Accommodations ample and delightful. Terms reasonable. Address M. Louise Putnam, The Ludlow, Trinity Terrace, Copley Square, Boston, Mass.

Teachers, etc.

WANTED IMMEDIATELY.—A young man of thorough scientific training as Assistant in the Chemical Laboratory of the State University of Iowa. For particulars address, giving full details as to qualifications, X. Y., P. O. Box 1538, Iowa City, Iowa.

A HARVARD GRADUATE AND German Ph.D. of experience wishes to tutor for the September examinations. Highly recommended. Address H. H. B., the *Nation*.

*MANUAL TRAINING TEACHER DE-*sires position. Three years' experience; wood work, iron work, drawing. Address CHAS. A. HEATH, Brookline, Mass.

A CHURCH SCHOOL GRADUATE desires a position in a school or family. Teaches English, French, and Music. Highest credentials and references. Address H. S., the *Nation*.

YOUNG LADY WHO HAS HAD several years' experience in a library would like position. Address F. G., *Nation* office.

*CHARLES W. STONE, Tutor for Har-*vard, 68 Chestnut St., Boston.

School Agencies.

*THE SCHOOL AND COLLEGE BU-*REAU, Elmhurst, (Chicago), Ill., supplies colleges, universities, academies, public schools, etc., with the best teachers. Records of candidates thoroughly investigated and full information furnished to employers free of charge. Send for list of available candidates. Address C. J. ALBERT, Manager, Elmhurst, Ill.

*AMERICAN AND FOREIGN TEACH-*ers' Agency supplies Professors, Teachers, Tutors, Governesses, etc., to Colleges, Schools, and Families. Apply to
Mrs. M. J. YOUNG-FULTON,
23 Union Square, New York.

THE FISK TEACHERS' AGENCIES, 70 Remo 4 Place, Boston, Mass., 70 4th Ave., N. Y., 106 Wabash Ave., Chicago, Ill., and 371 Main Street, Hartford, Conn. 100-page Agency Manual free. EVERETT O. FISK & CO.

THE NEW AMERICAN TEACHERS AGENCY.—Teachers seeking positions and those wishing a change at an increased salary, should address C. B. RUSSELL & CO., (Palace Hotel Building) Room C, 237 Vine St., Cincinnati, O.

AMERICAN AND FOREIGN Professors tutors, governesses, teachers, etc., supplied to colleges, schools, and families. MISS M. CROSBY, 150 5th Ave., cor. 20th St., N. Y.

SCHERMERHORN'S TEACHERS Agency. Oldest and best known in the U. S. Established 1855. 3 East 14th St., N. Y.

AN AGENCY is valuable in proportion to its influence. If it merely hears of vacancies and THAT is something, but it tells you about them when it is asked to recommend a teacher and recommends you, that is more. Ours **RECOMMENDS**
C. W. BARDEEN, Syracuse, N. Y.

Educational.

THE BELMONT SCHOOL

BELMONT, MASS.

Private Boarding School for Boys.

Boys prepared for Harvard on any of the four common methods of admission, for scientific school, or for business; courses can be arranged for special cases; school limited to sixty; two large buildings and new stone chapel (in course of erection); fine athletic field; two ball fields; fifteen acres on the old Cushing-Payson Estate. Terms, $600 per year. School re-opens September 28. Address
B. F. HARDING, A.M. (Harv.), Head Master.

MUSEUM OF FINE ARTS,

COPLEY SQUARE, BOSTON, MASS.
SCHOOL OF DRAWING AND PAINTING.
The Seventeenth Year will Open Oct. 3.

Courses in drawing from the cast and from life in painting, and in decorative design, with lectures on anatomy and perspective. Principal instructors: F. W. Benson, E. C. Tarbell (Drawing and Painting), C. Howard Walker, J. Madeira Smith (Decorative), Edward Emerson (Anatomy), and A. K. Cross (Perspective). Pupils are allowed the free use of the galleries of the Museum, giving certain hours. For information, address Miss ELIZABETH LOMBARD, Manager.

WILSON COLLEGE FOR WOMEN.

Fifty miles southwest of Harrisburg, Pa., in famous Cumberland Valley. 81 trains daily. Borders climate, avoiding bleak north. $200 per year for board, room, etc., and all college studies except music and art. Large Music, College and Art Musical department this year, 154, independent of free classes. Full faculty. College course, B.A. and B.S. degrees; music college, B.M. Handsome park, large buildings, steam heat, gymnasium, observatory, laboratories, etc. No charge for distant pupils during Christmas and Easter vacations. Rev. J. EDGAR, Ph.D., Prest., Chambersburg, Pa.

1856 MARYLAND 1892

AGRICULTURAL COLLEGE.

OPENS 21st SEPT., 1892. Situation unexceptionally healthful; 8 miles from Washington, on the B. & O. R. R. Full Agricultural, Scientific, Classical, Business, and Military Courses. Full Corps of Professors. Terms, $140, includes Books, Tuition, Board, Washing, Room rent, and Heat. Preparatory Department in charge of experienced instructors. Full particulars. Address REGISTRAR,
Maryland Agricultural College, College Park, Md.

THE CLAVERACK COLLEGE

AND HUDSON RIVER INSTITUTE
For Boys and Girls, will open its 39th year Sept. 19.
For catalogues address
Rev. A. H. FLACK, A.M., Pres't, Claverack, N. Y.

Siglar's Preparatory School

($600), Newburgh, N. Y.

Opens September 14. No rooms kept for boys not arranged for. HENRY W. SIGLAR.

WELLS COLLEGE FOR WOMEN, AURORA, N. Y.

Three Full Courses of Study. Location beautiful and healthful. New Building with Modern Improvements. Session begins September 21, 1892. Send for Catalogue. E. S. FRISBEE, D.D., President.

Educational.

The Columbian University,

WASHINGTON, D. C.

The Columbian College opens.....Sept. 26
The Medical School of the University opens...Oct. 1
The Dental School of the University opens....Oct. 1
The Corcoran Scientific School opens.....Oct 4
The Law School of the University opens.....Oct. 5

THE LAW SCHOOL FACULTY.

JAMES C. WELLING, LL.D., President,
And Professor of Public and Private International Law.

THE HON. JOHN M. HARLAN, LL.D.,
(Associate Justice of the Supreme Court of the United States.)
Professor of the Constitutional Jurisprudence of the United States, of the Law of Domestic Relations, of Commercial Paper, and of Torts.

THE HON. WALTER S. COX, LL.D.,
(Associate Justice of the Supreme Court of the District of Columbia.)
Professor of the Law of Realand Personal Property, of Contracts, and of Crimes and Misdemeanors.

THE HON. WILLIAM A. MAURY, LL.D.,
(Assistant Attorn y-General of the United States.)
Professor of Equity Jurisprudence, of Common Law and Equity Pleading, and of the Law of Evidence.

THE HON. DAVID J. BREWER, LL.D.,
(Associate Justice of the Supreme Court of the United States.)
Professor of the Law of Corporations.

PROF. A. H. EATON, A.M., LL.B.,
(of the Johns Hopkins University,)
Lecturer on the Civil Law.

HENRY E. DAVIS, A.M., LL.M.,
(Sometime Assistant Attorney of the District of Columbia.)
Professor of Common Law Practice, and Lecturer on the History of Law.

THE HON. AUGUSTUS S. WORTHINGTON, LL.B.,
(Sometime Distr ct Attorney of the United States.)
Lecturer on Legal Biography and the Use of Authorities in Court.

WILLIAM F. MATTINGLY, Esq.,
(of the Washington Bar.)
Lecturer on Practical Commercial Law.

THE HON. WILLIAM EDGAR SIMONDS, A.M., LL.B.,
(United States Commissioner of Patents.)
Professor of the Law of Patents.

THE HON. ANDREW C. BRADLEY,
(Associate Justice of the Supreme Court of the District of Columbia.)
Lecturer on Criminal Law, and on Criminal Pleading and Practice.

WILLIAM G. JOHNSON, LL.M.,
(of the Washington Bar.)
Judge of Moot Court, and Professor of Legal Categorics.

Prof. Wm. G. Johnson, LL.M., will conduct quizzing classes, composed of all students in the Undergraduate Department, that by his catechetical analysis the teachings of books, lectures and textbooks may be impressed upon the memories of the pupils.

This school opens Oct. 5.

For catalogues, giving description of the Lecture Courses in the Undergraduate and Graduate Departments, address
JAMES C. WELLING, LL.D., President.

THE OHIO UNIVERSITY

AT ATHENS now offers ten post-graduate scholarships having a cash value of $100 each, exclusive of tuition. The subjects are English Literature, Mathematics, Latin, Psychology, History of Education, Chemistry, Biology, Physics, Philosophy, Greek. It also embraces a full Preparatory and Undergraduate Departments. A thoroughly organized School of Pedagogy under the charge of Dr. J. P. Gordy is likewise in process of development.
CHARLES W. SUPER, President.

OGONTZ SCHOOL

FOR YOUNG LADIES.

Established in 1850. Twenty minutes from Philadelphia, two hours from New York. Opens September 28th. For circulars and reports apply to Principals.
OGONTZ SCHOOL P. O., PA.

Worcester (Mass.) Polytechnic Institute

Offers five courses of study, viz.: In Chemistry, Civil, Electrical, and Mechanical Engineering, and Physical and Political Science. Unsurpassed facilities for laboratory and shop work.
For Catalogue, address Institute, or
H. T. FULLER, Pres.

RIVERVIEW ACADEMY, POUGHKEEPSIE, N. Y.

57th year. Prepares thoroughly for College, the Government, Academies, and Business. Military Organization. BISBEE & AMEN, Principals.

Pennsylvania College of Dental Surgery.

The 37th Annual Session Oct. 3, 1892. Clinics ten months in the year. *Women admitted.* For information address C. N. PEIRCE, D.D.S., Dean, 1415 Walnut Street, Philadelphia, Pa.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 15, 1892.

The Week.

MR. BLAINE'S letter seemed carefully planned to put an extinguisher on the President's, and certainly it had the effect of doing so. In the first place, it is a document which can be read between the rising of the sun and the going down thereof, and, moreover, has considerable advantages in point of style over Mr. Harrison's extraordinary combination of a stump speech, a statistical report, a selection of clippings from a press-bureau, and a jumble of familiar editorials and "scare" articles taken from loyal Republican papers. Nor are Mr. Blaine's omissions unintentional. He expressly says that he "would not multiply issues," and so he sets aside deliberately a good part of the campaign material of the Republicans. First among the omissions is that of the names of the party candidates. This is doubtless accounted for in the "reasons which I have explained" to Chairman Manley. They were also explained to the country when Mr. Blaine threw his resignation of the State Department in the President's face, and thereby proclaimed his opinion that it was neither wise nor safe for the party to renominate Mr. Harrison. Next we observe a failure to refer at all to our glorious foreign policy, and a disposition to leave President Harrison to the exclusive enjoyment of the ex-Blaine Irishman whom he ostentatiously shouldered and attempted to make an issue in our politics. In like manner the Force Bill is put aside as one of those subjects to which Republicans ought not to allow themselves to be "diverted by our opponents." Steamship subsidies and poor, persecuted tin plate are also given the go-by.

Of the McKinley Bill Mr. Blaine says that, "for a time," it "failed to meet with popular approval," and even that "it was regarded with a certain degree of distrust by those who had always upheld the protective system." He has private information, however, that "a powerful reaction" has now set in. Mr. Blaine is naturally strong on the subject of reciprocity. He is rather hard on his own party, though, for having "refused to accept" the beneficent principle for so long a time, and compliments the Democrats for their "most generous appreciation of the question." This is only historical justice. On September 9, 1890, Senator Gray of Delaware moved a reciprocity amendment in nearly the precise words which Mr. Blaine had employed in submitting his original proposals to the Senate. Every Democratic Senator present voted for this amendment, and every Republican Senator present voted against it. This was a genuine measure of reciprocity, and the Republicans would not have it. It can scarcely be very soothing to them at present to be reminded of that fact by Mr. Blaine.

Both President Harrison and Mr. Blaine fall foul of the brief resolution in the National Democratic platform in favor of a repeal of the 10 per cent. tax on State bank notes. The former, having some hazy conception that the national bank system is coming to an end through natural causes, and that something ought to be done about it some time, says: "Changes may become necessary, but a national system of currency safe and acceptable throughout the whole country is the good fruit of bitter experience, and I am sure our people will not consent to the reactionary proposal made by the Democratic party." Mr. Blaine, with his usual recklessness and his real ignorance of finance, assumes that the national system is a permanent system, and that the people have merely to choose between that and the State system which existed before the war. Any other or better State system born of experience, intelligence, and accumulated capital is equally ignored by both, and it is quite likely that neither of them considers any other than the wild-cat State banks possible, although the old State Bank of Indiana, with its numerous branches, was as sound as the Bank of England, and, when compelled to wind up its affairs, paid every depositor, note holder, and shareholder in full. There have been many national banks with a worse record. In truth, the bad banks of the ante-war period, taking the country altogether, were the exception and not the rule; but, of course, the bad ones had the most notoriety, just as one case of cholera now has more notoriety than a hundred cases of sound health.

The September election in Maine is always watched with interest throughout the nation. The campaign this year has turned to some extent on State issues, especially the question of the prohibitory law, as the Democrats have come out strongly in favor of resubmitting the constitutional amendment, and, in case of its rejection, substituting a license law. The rising tide of public sentiment throughout the country against the policy of prohibition is felt also in Maine, although it is not likely that the reaction is as yet strong enough to effect a change in the Constitution. But if State issues have been more prominent in Maine than in Vermont, the Republicans have done all in their power to make the election a test of popular feeling regarding national affairs. Boutelle's Bangor *Whig and Courier*, for example, closed its last appeal to the faithful with these words:

> "All eyes are upon Maine, and she should be true to her past record of devotion to the great principles of good government. A Democratic vote is a vote in the interest of free trade and free silver; a vote for the Republican ticket is a vote for protection and honest money."

As we go to press, the returns of Monday's election are still incomplete, but indicate that the gain of the Democrats has been four times that of the Republicans as compared with their respective votes in 1890, when the total of course fell far short of the Presidential year. The same percentages applied to the remaining towns allow a Republican plurality of barely 12,000. The significance of this can be fully understood only by comparison with the record of similar September elections in Presidential years. We append a table giving these figures for each such election during the past twenty years, except 1880, when there was a fusion of Democrats and Greenbackers which elected a former Republican to the Governorship:

	Rep. vote.	Dem. vote.	Rep. plurality.
1872	71,917	54,701	17,216
1876	75,867	60,423	15,444
1884	78,912	59,061	19,851
1888	79,393	61,350	18,043
1892	68,000	56,000	12,000

It will be seen that the Democrats have this year polled within 5,000 of their full vote, while the Republican vote is more than 10,000 short of what was cast in the corresponding elections of each of the last two Presidential years. As a consequence, the Republican plurality will be unprecedentedly small—only about 12,000, against 18,000 in 1888 and nearly 20,000 in 1884. Compared with 1888, the Democratic vote now is within 9 per cent. of what was then cast, while the Republican vote has fallen off 15 per cent., or nearly twice as much. Of course, if the Democrats poll anything like their vote of 1888 throughout the United States, while the Republicans lose 15 to 20 per cent., as in Vermont and Maine, Cleveland will sweep the country.

A noticeable effect of the Vermont election has been the sudden discovery by the Republicans that, as their chief organ hastened to announce, "Reciprocity is a Great Issue." Unlimited high tariff and escape from foreign competition were dinned into the ears of the Vermont farmers, but their stolidity under the treatment, and their obstinate demonstration that they do not like the McKinley Bill any better now than two years ago, have forced the Republican managers to cast about for a more alluring battle-cry. Unfortunately, they have as their candidate a man who is not heartily in favor of reciprocity, and who no-

where in his letter of acceptance showed more clearly his pettifogging training and habit than in his references to the effects on our trade of the reciprocity arrangements. It is a pity that he had not seen a letter written to the *Commercial Bulletin* of September 2 by a merchant engaged in the South American trade, in which is the most complete exposure of the real workings of reciprocity. This writer shows that while there has been, in the past five months, a gain of 32 per cent. in our exports to the Spanish-American countries with which we have treaties (almost all of it being due to Cuba), there has been an increase of over 11 per cent. in our exports to the other countries in the same part of the world, and, on the other hand, a decrease of 43 per cent. in the case of those countries — Hayti, Colombia, and Venezuela — where "reciprocity" has taken on its real form of retaliation.

It is already apparent that the Republican platform did not go far enough in its efforts to identify protection with the interests of the workingmen alone. Its sole demand was for "duties equal to the difference between wages abroad and at home." On the question of immigration it simply called for "more stringent laws and regulations for the restriction of criminal, pauper, and contract immigration." But this bid for the labor vote has been found to be absurdly low, and accordingly it is being raised from time to time as the canvass progresses. In the platform of the Connecticut Republicans, adopted on Wednesday week, we read, for example:

> "We believe that the interests of the laboring men of this country demand that the tariff upon the productions of cheap foreign labor should be supplemented by the stringent prohibition of the importation of foreign paupers, criminals, and contract laborers; and that, if necessary, existing laws regulating immigration should be so amended as to further protect the American wage-earner against degrading competition *with imported cheap labor as well as the imported products of such labor.*"

This is a practical admission that the tariff of itself does not protect the workingman, and shows that the party of protection has been forced at last to abandon the position of which the late Congressman W. D. Kelley used to boast, that the only kind of free trade the Republicans wanted was free trade in labor.

Senator Sherman has written a letter, designed ostensibly to contradict a report that he was hostile to a protective tariff, which contains this decidedly lukewarm praise of the McKinley Law:

> "I have believed that as to certain items in different tariffs we have gone beyond the line of protection which is necessary to foster American industries. A few rates have been adopted that I think will exclude competition between foreign and American productions, and secure a monopoly to the American manufacturers. This I do not believe to be a wise policy. There are some details of the McKinley Tariff Bill that may be subject to this objection, but, on the whole, it is the fairest and best tariff, not only for revenue, but for protection, that has had a place on our statute-book."

There is very little sympathy for latter-day protection in that passage, for the main object of that system is to secure a monopoly of the market to the American manufacturers. "American markets for American goods" is one of the party slogans of the campaign, yet Mr. Sherman says he does not think that kind of policy is a wise one.

We shall see in the result of the election in the Fourteenth Ohio Congressional District how much appreciation the ex-soldier of Ohio has for services rendered him. This is the new district in which Mr. Michael D. Harter is a candidate for re-election, and he has against him the formidable majority of 1,692 votes. No man in Congress did more to defeat free coinage than he, and it is clearly within bounds to say that, if he had not been there, it would have passed the House, for our readers and the ex-soldiers of the country remember how very near it came to passing as it was, and the entire nation recognizes the great efforts, indeed the enormous amount of work, Mr. Harter did in compassing its defeat. In this fight he served the pensioners in a way they can hardly forget. Contrary to expectation, the Senate passed the free-silver bill, and when it went back to the House it was defeated signally. The country and the soldier may never know fully how much they owe to Congressman Harter. Mr. Harter's work in Congress last winter has saved the pensioners of his district alone $155,000 a year. There are enough Republican ex-soldiers in the district to turn the majority in his favor, and there are very many people in the district who say that the soldier vote will send him back to Washington triumphant.

Gov. Russell of Massachusetts has propounded a dilemma to protectionists of the McKinley type which it is safe to say they will let severely alone. If, when a duty is laid by the United States upon an imported article, that duty is paid by the foreigner, it follows that a "drawback" of 99 per cent. of the duty when the article is exported is a gratuity to the American exporter. To take the case of tin plate: it is now claimed by the protectionists that the Welsh manufacturers are selling it in this country at about the same price as before the McKinley tariff was adopted, and that the duty is therefore paid by them. But the Standard Oil Company, it is said, has received from our Government $1,500,000 as a drawback upon the tin cans in which their product is exported. If the foreigner paid the duty on the tin plate, the Standard Oil Company did not pay it. It is therefore a falsehood that the duty is paid by the foreigner, or else the Republican party is paying an enormous subsidy to a very great monopoly. It is also well to consider that if the foreigner does not pay the duty, the American people are taxed in order that the Standard Oil Company may sell oil cheaper to the inhabitants of foreign countries than to their fellow-citizens. How can the American tin-plate industry flourish under this competition? Unless our tin-plate-makers will sell their wares to the great exporters of canned goods at the cost of the Welsh tin plate without duty, these exporters will not buy of them. They will point out that if they buy the Welsh tin plate, they get back more than two cents a pound when they sell it again, while if they bought the American tin plate, they could not afford to pay so much for it by two cents a pound, because when they sell it they get no drawback. So far as the immense export trade in canned goods is concerned, the duty upon tin plate has no protective character. The operation of the drawback system deserves examination at the hands of the Democratic campaign orators.

The question has been raised at Washington, Who are to be considered immigrants under the recent Treasury circular? It must have been known at the time when the circular was issued that it contained no definition of the word "immigrants" which could serve as a guide for steamship companies. There is a difference between tourists and immigrants, yet if an immigrant calls himself a tourist, how is his own statement to be rebutted? The steamship companies generally considered the term to apply to steerage passengers, and stopped taking people in the steerage. Now the report comes that persons who are probably immigrants are taking passage in the second cabin, and the Treasury Department is stirred up on that account. This dilemma shows the importance of issuing an order in the right terms at the beginning—if there are any right terms for an unlawful act. It has been pointed out that the utmost authority granted by law is to exclude immigrants from infected ports. Public opinion, no doubt, sustains the order at the present time, but that circumstance does not give it additional validity, nor does it help to supply definitions for the word immigrant. Some idea of the difficulty surrounding this matter may be inferred from the fact that on the last trip of one of the White Star steamers a steerage passenger, when he came aboard, deposited $12,000 in money with the purser for safe-keeping. If this man was an immigrant, he might easily have come in the first cabin. Moreover, it is not our policy as yet to exclude one who brings $12,000 into the country.

The steps taken to keep the cholera out of New York have thus far been very effective, but they ought not to be exclusive. The policy adopted in the first instance was that of keeping all the passengers continuously on board the infected

ships, so that they were liable to become infected and die consecutively, their liability to contract the disease becoming greater with every day's detention, as they became more alarmed, and therefore weaker, by the contemplation of the scenes around them. This notable policy was in full course of execution until two private citizens came forward and offered the means to remove the passengers to a place of safety—Mr. Morgan buying a steamer outright for the purpose, and Mr. Corbin offering to make the old Sandy Hook railway station habitable at his own expense. Public opinion meanwhile had begun to weigh with some severity on the public authorities, and they made haste to accept these offers. Nothing more humbling to our civic pride can be imagined. If 1,500 men were imprisoned in a mine by an explosion of fire-damp, but were known to be alive, what efforts would be spared for their rescue? Even though they were all foreigners—Hungarians, Russian Jews, Armenians, or Chinese—every resource that wealth and skill could supply would be actively and incessantly employed for their release. Yet these 1,500, mostly our own neighbors and friends, have been fastened in close proximity to a plague and deliberately imprisoned there. And this has been done by authorities specially appointed and commissioned to look after the public health. Granted that the facilities were not at hand to dispose of these passengers in a place of safety, whose fault is it? We had had warning enough. We knew what was coming, or what we might expect at any moment. Yet no preparation whatever had been made to dispose of healthy passengers arriving on ships where there might be one person sick, or where there might have been one or more deaths on the passage.

The people of New York have in fact during the week had before their eyes a leaf out of the history of the middle ages. They read, among much other material of the same sort, that about 500 perfectly healthy persons, their own neighbors and blood relatives, who had been kept pent up for a week or more in close proximity to the cholera for the purpose of experiment—to see whether they would catch it or not—had at last been transferred to a non-cholera steamer for conveyance to an island nine miles distant from the towns of Babylon, Bay Shore, and Islip, and separated from them by a sheet of salt water which cannot be crossed by the customary means of conveyance in less time than an hour; that when the news of this intended transfer reached the inhabitants of these towns, they rose in fury and declared that no such transfer should be made, and that they would prevent it by force if necessary; that this determination was not confined to ignorant people, but was in fact started by the leading citizens and by the local Board of Health; that while no difficulty was experienced in finding cooks, waiters, stewards, chambermaids, sailors, carpenters, etc., who were willing to be brought into personal contact with the passengers, yet the Babylonians—we use this generic name for all of them—did everything in their power to drive them back to the place from which they had been with the greatest difficulty removed, and finally got an injunction issued by a judge against their landing; while on Monday night an angry mob of baymen forcibly resisted the landing, denying it even to the women and children, in spite of the most moving appeals.

Bear in mind that none of these people had been sick. They had been kept alongside the cholera for eight days, or for fourteen if we count the ocean voyage, yet none of them had contracted the disease. Therefore, according to the five-day-quarantine rule adopted in the beginning, these passengers were entitled to be landed. But the Quarantine Officer had meanwhile been upset by the twenty-day circular from Washington. This circular, prescribing twenty days "or more," has been adopted as a minimum, and now the question became not whether the passengers would catch the cholera in the course of time, but how long they could survive the other horrors of their detention. Another word is due to the Babylonians. The Surf Hotel at Fire Island is, as we have said, nine miles from the mainland. The *Normannia* and all the other so-called "pest-ships" have been nearer to the city of New York, all the time, than these *uninfected* passengers would be to Babylon and Islip if they were at the Surf Hotel. It is needless to say that the teeming population of Staten Island have been within a much shorter distance of these ships, and are at a much less distance all the time from the real pest-house on Hoffman Island; and yet they go about their business in a decent and orderly way. The Babylonians are not different from other people at heart, but they appear to have lost their heads altogether.

The public mind was so much engrossed last week with the cholera excitement that a most significant and encouraging development regarding the question of opening the World's Fair on Sunday failed to receive due attention. This was the action of the New York State Board of Woman Managers, which adopted, with but a single dissenting vote among the fifteen present, the following resolution, presented by Mrs. Frederick P. Bellamy:

> "Resolved, That the New York State Board of Woman Managers request that the Columbian Exposition be opened on Sunday for the benefit of all classes."

Inasmuch as the efforts of bigoted Sabbatarians to keep the Exposition closed on Sunday have received so much support from women who never stopped to inform themselves as to the merits of the case, it is most gratifying to find a body of representative women like this Board speaking so emphatically and unitedly on the common-sense side of the question.

An interesting comparison is drawn by the *Financial Chronicle* between the iron industry in Great Britain and that in the United States. For several years this country has produced more iron than any other, but in the first six months of 1892 it is computed that our consumption amounted to 5,200,000 tons, while the amount both consumed and exported by Great Britain was 1,400,000 less than this. The comparison requires to be modified in view of the great strike of the Durham miners, which probably accounts for the decrease from last year of a million tons in the British production. Still, if we examine the production for the last four years, it appears that the United States show a larger gain than Great Britain, and it is scarcely probable that our country will hereafter be second in this race. It is to be remembered, however, that for some years Great Britain has ceased lending to South America and Australia, and that these loans to a large extent took the form of iron.

It is too soon to know what additions to our knowledge are to be made through the success of Lieut. Peary's Greenland expedition, but it is gratifying to learn that expeditions of this character can be carried through as they are planned. With very moderate financial support, the exploring party seems to have accomplished practically all that it had laid out for itself, with no loss of life except through an accident of the character to which all Alpine climbers are exposed. The sledge journey of 1,300 miles made by two men and occupying three months is certainly one of the most remarkable feats of this description that have ever been accomplished, and suggests the possibility of extending Arctic discovery much further than had come to be considered practicable.

The working of republican institutions in Brazil had a characteristic manifestation in the recent election of a Congressman from the Federal District including the city of Rio de Janeiro. The official lists showed qualified voters to the number of 29,971, but the total vote cast was considerably under 2,000. Nor was this the result of an uncontested election in which there was no interest. The contest between the two leading candidates was spirited, and they came out within a hundred votes of each other. The capital city, moreover, is probably the place in the whole country where there is most intelligence among the voters and the greatest interest in politics. It may be imagined what the farcical character of popular elections is in the remoter and more ignorant regions.

THE VERMONT ELECTION.

VERMONT is a small State, and her inhabitants have the reputation of being very set in their opinions. Most people would probably say, at first thought, that there is hardly a commonwealth in the whole Union which was less likeiy to feel the first slow movements in the rising tide of public sentiment, and thus to give early indications of the way that an irresistible current was sweeping the country. Yet it is a fact, which a little study of the '*Tribune* Almanac' will establish, that for a quarter of a century the gubernatorial election of Vermont in the September of a Presidential year has foreshadowed the result of the national contest in the ensuing November; a large Republican majority for Governor being followed by a Republican victory, and a small Republican majority by a Democratic success. In September, 1872, the Vermont State election gave the Republican candidate 41,946 votes, and the Democratic 16,613—a Republican plurality of 25,333; and two months later Grant beat Greeley "out of sight." On the other hand, in 1876 the totals of the two parties were 44,723 and 20,988—a Republican plurality of only 23,735; and Tilden carried all of the doubtful States. In 1880 the Republican majority in Vermont's September election leaped up again, the two parties polling respectively 47,848 and 21,245 votes—a Republican plurality of 26,603; and Garfield carried the country. In 1884 the Republicans of Vermont showed the first effect of Blaine's nomination by giving their candidate for Governor only 42,524 votes, against 19,820 for the Democratic—a Republican plurality of but 22,704; and Cleveland was elected. In 1888, however, the pendulum swung far over to the other side, the Republicans casting the largest vote on record, 48,522, against 19,527 for the Democrats, which gave the Republicans the unprecedented plurality of 28,995; and Harrison was elected.

The State election of 1892 in Vermont was held on September 6. There was a special reason why the commonwealth should this year give a great Republican majority, for President Harrison has paid it the great compliment of giving it a place in the Cabinet in the person of ex-Gov. Proctor, whom he made Secretary of War. Mr. Proctor, who was elected Senator last year to succeed Mr. Edmunds, fully appreciated the importance and significance of the contest. In a speech delivered to his old neighbors in Rutland last month, he thus "laid down the law," and every good Republican organ has printed his words in large type ever since:

> "I wish to impress upon you the importance of the coming September election. It is not a State matter, but a national one. The vote cast for the State ticket next month is really your vote for President and the expression of your choice between the principles of the two great parties. The main question cannot be covered up by any State issues. If the Republican party maintains its average majority, it will be hailed as a Republican victory. If the Democrats reduce that majority, it will be heralded far and wide as an omen of Democratic success in the nation. You are individually responsible for a full vote for Fuller and Stranahan, and I believe you will do your duty and see to it that Vermont rolls up a handsome majority in September that will presage the election of Harrison and Reid in November."

The returns from the election are already sufficiently complete to show the result with perfect clearness. So far from there being "a handsome majority," or even the "average majority," for the Republican party, the majority is by far the smallest recorded in the September of a Presidential year during the past quarter of a century. The comparison with corresponding elections in the Septembers of previous Presidential years is as follows:

	Republican vote.	Democratic vote.	Rep. plurality.
1872	41,946	16,613	25,333
1876	44,723	20,988	23,735
1880	47,848	21,245	26,603
1884	42,524	19,820	22,704
1888	48,522	19,527	28,995
1892	39,000	19,000	20,000

These being the undisputed facts regarding the election, how do the Republican organs treat this unprecedented falling-off in their party's majority? The Philadelphia *Press* explains that there was "much indifference" among Republicans. But why indifference? If there is one State in the Union where Republicans should not be indifferent when asked to express their opinion on McKinleyism, it is Vermont, for the Boston *Journal*, the leading Republican organ of New England, declared a few days ago that "no State has profited more by the McKinley Tariff Law than Vermont. Its granite, its marble, its maple forests, and its farms alike have felt the stimulating influences." The New York *Tribune* says that "in 1888 the national campaign began early, and the wool issue was regarded as of momentous importance by the voters of Vermont." But is not the wool issue of even more importance in 1892, when a Democratic House has recently passed a free-wool bill? The Philadelphia *Press* says that there was a "failure to make an energetic campaign" on the part of the Republicans. But the Boston *Journal*, which is much better informed as to New England affairs, said in its editorial columns on September 1:

> "The immense crowd which turned out at Burlington Tuesday to listen to Gov. McKinley speaks well for the interest of Vermont Republicans in the present campaign. It is especially encouraging, as it does not appear that it is any isolated manifestation of enthusiasm. Other meetings, if not as large, certainly as earnest, have been held in various parts of the State. Nearly one hundred clubs have been organized by the Republican League in as many towns, and everything points to a vigorous attention to the election."

So the *Vermont Journal* said of McKinley's stumping tour: "Everywhere in the State he has been received with the greatest enthusiasm, listened to with the deepest interest, and left an impress that will weigh heavily against free-trade apostles in the coming elections." His "rally" at Burlington was "one of the largest political gatherings ever recorded in the history of the State." How heavily he weighed in that town may be seen from the election returns: in 1888 the Republicans cast 1,401 votes, but on September 6, 1892, they could muster only 1,016, while the Democrats increased their total from 1,014 to 1,106. McKinley had another tremendous meeting at Brattleboro, and weighed heavily on the wrong side again, depressing the Republican vote from 1,002 to 862. All this reveals not merely Republican apathy, but positive ingratitude, for McKinley told the Vermonters plainly: "There is not one of you who has not been blessed by this law [the tariff], and you know it."

The hollowness of much of the Republican talk about "a free ballot" is shown by the movement already reported under way in Vermont to repeal the law introducing the Australian system of voting. This system provides the best possible facilities for "a free ballot," enabling every man to vote as he chooses, without interference and even without the knowledge of any one else as to how he votes. The late election was the first ever known in Vermont in which every voter enjoyed perfect freedom of action in casting his ballot. The Democrats have always claimed that such a system would help their party, and the result justifies their confidence. No sooner is the result known than the Republicans attribute the falling-off in their majority to the Australian system, and call for its abolition. In considering this explanation it must be kept in mind that the Republicans always claim to be "the party of intelligence," and deride the Democrats as an ignorant set, so that, if a new system of voting makes it hard for ignorant men to vote, it should be the Democratic party which would suffer. If it is really true that 9,000 Republicans in Vermont out of 48,522 voting in 1888 are so ignorant that they remained away from the polls rather than display their ignorance, the prospect for the party is certainly a dreary one in States like Indiana, which have hundreds of thousands of Republicans, and which will vote under the Australian system this year for the first time in a Presidential election.

THE FUTURE OF SILVER.

PARADOXES never cease. At the moment when the price of silver is the lowest ever recorded, when our Government purchases threaten to swamp the national finances, when the International Conference is confronted with the question whether there is any way whatever of preventing silver from slipping into the same place as copper and nickel in the money of civilized nations, Dr. Suess comes bravely forward and writes a book that should cheer the

hearts of our despondent silver friends. Silver, not gold, says he, is the money of the future.

'Die Zukunft des Silbers,' just published by this scholarly writer, tells the world that the supply of gold is limited, and that its production must tend to decline; the consumption in the arts and for industrial uses must steadily rise; sooner or later, therefore, the amount of gold available for monetary uses will prove insufficient to supply the growing demand of civilized countries, and gold must cease to be the basis of their money systems. On the other hand, silver is not in so perilous a condition as the faint-hearted may think. True, its production has increased enormously of late; but the sources from which the great quantities have come in the United States and recently in Australia are not of a permanent sort. The geological and metallurgical conditions are such that these great finds give out after a few years of working, and there must before long be an end to the discovery of new ones. On the other hand, the old mines of South America promise a moderate but steady and permanent flow of silver, such as will supply the monetary systems of the world without gorging them. Eventually, therefore, we shall be forced to discard gold and adopt silver as the monetary metal. The events of the last fifteen or twenty years represent only an eddy in the great current that must in the end bring the world to a silver basis. Even international bimetallism could ward off the result only for a while. Our author agrees with those who regard international bimetallism, supposing it to be practicable, as only a temporary device. But he says it is a device not for saving silver for a couple of decades from the inevitable collapse, but for saving gold for a time from its inevitable expulsion from monetary use. Meanwhile, so long as the present anomalous state of things lasts, the gold-using countries suffer and writhe, and the silver countries prosper and rejoice.

All this has a familiar ring, and, summarized thus baldly, might come from some of our blatant silver organs. We must do Dr. Suess the justice of saying that he is a scholar of standing, writes simply and calmly, and spares us all claptrap. More than this, as a geologist he writes with some authority. His book is mainly on the geological and mineralogical conditions of the precious metals; and if conditions of this sort were decisive in determining the monetary future of silver and gold, he might be right. Doubtless it is true that for the future the supply of gold from the mines, available for monetary uses, will not grow rapidly, and may actually decline; and that the increase in the production and supply of silver is not likely to be long maintained at its present high rate. Doubtless, also, if metallic coin alone served the purposes of money in civilized countries, the needs of growing numbers and wealth could not be conveniently supplied from gold alone, and silver must be resorted to in order to prevent a heavy and probably distressing fall in prices.

The simple and obvious fact, however, is that metallic money plays a less and less important part in the machinery of exchange in advanced countries, and that therefore the conditions which determine the supply of the precious metals are becoming factors of less and less economic importance. All the various forms of credit —Government notes, bank notes, checks, and bank deposits — supplant metallic money for all large transactions in growing proportions, and cause gold to be used mainly as a basis on which credit rests, and as a medium for effecting that small remnant of transactions which must be settled by the transfer of actual coin. It may be argued that even for purposes of this sort the supply of gold ought to increase as the transactions that rest on it grow. True, perhaps, if the machinery of credit remained always the same. But that machinery develops and becomes more efficient, and tends steadily to diminish the proportion of coin that is called for. There is no indication that in the recent past the quantity of gold has been inadequate to supply all needs without embarrassment, or that in the visible future it will be so. On the other hand, silver is being relegated to a use substantially as a subsidiary coin, performing the services for moderate transactions which copper and nickel perform for small transactions. Possibly, silver is not the best ideal medium for such purposes; but it is here, and the financial difficulties of making any great change will keep it here for a long time to come. At all events, for limited use as subsidiary money, it is not very material whether the price of silver be high or low. The important thing is simply that too much of it be not coined or issued. If production increases as it has done in recent years, the main consequence must be that the price will fall until the mines begin to close or some other use for the metal is found—a process which is now going on under our eyes.

So far as the distant and ultimate future is concerned—and this is what Dr. Suess really has in view in his speculations—it is idle to worry or to make predictions. The time, perhaps, will come when the industrial use of gold and the wear and tear on the monetary supply will exceed the annual production, and we shall have to deal with an actually diminishing volume of gold money. Perhaps, too, after a couple of centuries, the production of silver will have greatly diminished, and the conditions for enlarging its use as money will be favorable. But then the civilized nations by that time may have done away with war, or developed into full-fledged socialism, or adopted a tabular standard of value and dispensed with coin money altogether, or done various things which we may now regard as probable or improbable. For the present we need not borrow trouble on these topics, or on the distant future of gold and silver. We may be content with that solution of the bimetallic question to which the civilized world has been slowly but steadily moving ever since the great fall in the value of silver began twenty years ago: gold as the standard, silver to supplement it for subsidiary uses. Just now, we in the United States, under the act of 1890, are going too fast and too far in the effort to find a large use for silver. But all the signs of the times point to an early repeal or modification of our present silver legislation, and to the acceptance of the situation as France and Germany and Austria have accepted it. The world will move along well enough under such a régime for as long a time in the future as it is humanly possible to make provision for.

A NEW DEPARTURE IN MUNICIPAL GOVERNMENT.

THE year which marks the fourth of our Columbian anniversaries has lately been celebrated by the town of Quincy, Mass., as closing the first century of its corporate existence. In that period its interest in the shore along which it lies, in ships and the seafaring life, had been severed by the railroad as effectively as by nature in past ages, when the elevation of the New England coast made Quincy an inland site. Its population, meanwhile, steadily increased until the simple form of government by town meeting and selectmen became unworkable, and was perforce abandoned in favor of the city form. In January, 1889, the new order went into operation.

This is not so commonplace a circumstance as would appear upon the surface. It forms the burden of an address to his fellow-citizens by Mr. Charles Francis Adams on July 4, if "burden" can be associated with this writer's nervous and entertaining style—"The Centennial Milestone." The new charter he shows to have been framed mainly by two Harvard graduates, Josiah Quincy and Sigourney Butler, young men and lawyers both, after a serious study of the defects of existing municipal governments, and consultation with the deepest thinkers on the subject. A third Harvard man, Mr. Gamaliel Bradford, whose ideas are not unknown to our readers, was a weighty adviser, and his hand will be recognized in the project which the town finally adopted. We will briefly state that the guiding principle of the Committee was to make a non-political business government, with "a responsible single executive, and a council much in the nature of a board of corporation directors." To the Mayor was given "a larger and more arbitrary power within his department than had ever in the United States been confided to the executive head of any organization classed as political." He and his cabinet of

administrative officers appointed by himself

"are required to be present at all regular meetings of the Council, and to give such information as may be asked for as to the business of their respective offices; they are given the right to speak upon all matters relating to their offices, but without the right to vote. They are also required to place upon public record the reasons for every removal from office made by them. The Mayor may, further, be removed at any time by a vote of two-thirds of all the members of the Council."

This body consists of twenty-three members, chosen partly at large, but chiefly by districts, the original scheme having equalized the two classes. The popular amendment Mr. Adams regards as clearly unfortunate, and as perhaps the leading cause of the small satisfaction given by this branch of the Government in the three years of actual experiment. He advocates the abolition of all ward lines, and regrets that the Committee did not venture to incorporate a method of proportional representation.

Even so, however, he does not feel sure that the adoption of Quincy's new charter marks an era in American political development. The problem still remains, how to enlist the "best men" in the conduct of affairs; and he boldly comes out for compulsory municipal service, after the fashion of compulsory jury duty. He finds needful support, dear to the antiquary as well as to the political innovator, in the early annals of the town, when his own ancestor, John Adams, had either to pay a fine or accept the nomination of him made at town-meeting for surveyor of highways. Other examples in plenty are cited; some of the recalcitrant, like the future President, resigning themselves to the duty imposed upon them, while others paid the penalty prescribed. We understand that Mr. Adams has in mind popular election only, as (in Quincy) to the mayoralty, the school committee, and the council; not appointments by the Mayor or the heads of departments. Of compulsory voting, now advocated in some quarters, he takes no notice; and certainly if the choice of public officers could by habit or prescription be made to lie among the élite, the universality of the voting would be of secondary importance. But, as to the suffrage, Mr. Adams contemplates no limitation of it, and there appears to be no provision in the Quincy charter for a control of public expenditures by the taxpayers, as proposed by the Tilden Commission.

More will have been learned in ten years than in three of the success achieved by the Quincy reformers. In the meantime it is to be hoped that the outside course of political evolution will come to their aid. The breaking down of district lines in choosing State and national Representatives would make for them, and that this is possible in Massachusetts is shown by the non-resident candidacy of Dr. William Everett two years ago. Nothing, again, would do more to familiarize the voter with the business view of municipal administration than the growth of the same view with reference to the State administration. Mr. Adams insists that "the State is a political entity; the municipality, a mere business organization." This is true of the municipality, but it is not the whole truth about the State, which is also a business organization in every particular in which the town or city is. Ordinances and statutes which look to assessments, the levying and collection of taxes, the laying out of streets and railroads, to parks and reservations, the public health, the police, differ only in extent, not in kind. The initiative and supreme authority belong to the State in the passage of general laws, but it too has to "keep house." The *trust* reposed in a member of the State Legislature is precisely the same as that reposed in a selectman or an alderman, even if a higher type of intellect and training be required for a legislator's work; and it is a business trust—namely, to guard the interests of his employers, who bear the cost of government.

Now, one of the greatest evils in our Federal life is that men will persist in voting for Governors and members of the Legislature on grounds which nominally relate solely to Federal politics, whereas, in ordinary times, at least, a "Republican" or "Democratic" Governor is a pure misnomer. We cannot say the same of State Representatives or State Senators, and here the mischief lies. The Federal Constitution has committed to these men the charge of electing Senators of the United States. Hence the first consideration in their case is, not, What is their opinion about State policy? but, How will they affect the balance of power in Congress? This is an absurdity, and worse, but we must put up with it until we can amend the Constitution, unless a way can be devised to take the choice of Senators out of the hands of the Machine and give it to the people indirectly, without violating the present provision. Such a reform, relieving the would-be independent voter of any thought of national politics when voting for State officers—of "off-years" and Presidential years—would be a powerful solvent of party cohesiveness, and would permit townsmen and citizens to associate freely for State and local objects, while agreeing to differ when the national policy was at stake. For ourselves, we believe this a nearer and more practical end to strive for than compulsory municipal service. The "best men" will be found at the front just in proportion as the mass of the electors take a sound and enlightened view of the nature of all government. Raise the tone of the constituencies sufficiently high, and you will soon have the cultivated class who have turned their backs on politics, offering their services to the public. The names, even now, of Adams, and Bradford, and Everett, and Quincy, and Russell are of good omen for such a consummation; and this suggestive pamphlet, "The Centennial Milestone," just from the press, will be no mean instrument to that end wherever it is read.

THE EIGHT-HOUR MOVEMENT IN ENGLAND.

THE influences which determine the course of English elections are to the American eye mysterious and past finding out. Newcastle, which returns two members, gave Mr. John Morley about 11,000 votes at the general election, and when he stood again raised the number to 13,000. The Conservative candidate at the general election had headed the poll with nearly 14,000 votes, while Mr. Ralli, who opposed Mr. Morley at the second election, got little more than 11,000. At the same time the total number of votes registered at the two elections was very nearly the same. It is absurd to say that the issues between the parties had changed within a month, and the causes of this extraordinary change in the sentiment of the constituency are inscrutable. If the issue that interested the voters were home rule for Ireland, Mr. Morley's vote should have been as great in the first as in the second election, perhaps greater, for the issue of the conflict was doubtful in the first place, while victory was assured in the second. Mr. Hamond, the successful Conservative candidate, is said to have been very popular, but Mr. Ralli was not at all an unpopular candidate. Upon the eight-hour question, however, there was a marked difference in the attitude of the candidates, and we should be glad to believe that Mr. Morley's bold attitude had something to do with his success.

It is to be borne in mind by American readers that the constitutions of all our States contain guarantees for personal liberty that the much-praised British Constitution does not. No American Legislature can forbid an adult citizen from working as long as he chooses. It is competent for a legislature to forbid a corporation which it has created from employing men more than a certain number of hours in a day, although it may be doubted if this prohibition would be sustained against an attack on the part of a workman who was hindered by it in his efforts to earn a living. At all events the power of our legislatures stops short when they are confronted with the inalienable right of the individual man to "life, liberty, and the pursuit of happiness." This is not true in Great Britain. The Parliament of that country has complete and unquestioned power to ordain that no British subject shall perform labor for more than eight hours out of the twenty-four; and what is known as the "eight-hours movement" is the endeavor to bring about the enactment of such a law.

It was demanded of Mr. Morley that he should promise to support a law of this kind, which promise he declined to make. He admitted the power of Parliament, and expressed his sympathy with all endeavors directed to the lightening of human toil; but

he maintained that it was uncertain that a majority of the workmen at certain trades were in favor of such a law, and that it was certain that in some trades a majority of workmen were opposed to it, and he asserted that under those circumstances the law ought not to be adopted. The argument which to an American audience would have been most effective of all—that, no matter what a majority of workmen at any trade wanted, they had no right to force those who differed with them to surrender their freedom, and that any law aiming at this result was oppressive and wicked—was not thought of either by Mr. Morley or by his "hecklers." The absence of a written bill of rights proclaiming certain immutable principles of liberty has allowed the minds of Englishmen to fall into much confusion upon these subjects, and the socialistic haze has so beclouded the vision of many of her economists that they have little idea of the perils upon which they are drifting.

On the other hand, Mr. Morley's opponent made satisfactory concessions to the eight-hour advocates. He did not see his way clear to an immediate adoption of the principle in all occupations, but he was ready to begin with some as an experiment—to give the miners an eight-hour bill if they wished it, and to extend it to trades which were harmful to health and dangerous to life. These expressions were upon the whole satisfactory to the eight-hour party, and their votes were therefore, it is to be supposed, cast against Mr. Morley. Newcastle being proverbially a mining community, it might have been expected that Mr. Morley's vote would have been smaller at the supplementary election than at the previous one. But, as we have seen, he came out nearly 2,000 votes ahead instead of over 3,000 behind. It is certainly a plausible view that the dangers of the eight-hour movement had come to be so generally understood as to lead many voters, who would have preferred to support a conservative candidate, to give their suffrages to a man who had the courage to withstand a clique of ignorant laborers.

But whatever encouragement may be derived from the result at Newcastle is dashed by the unexpected performance of the textile operatives of Lancashire. These working people have been hitherto distinguished by their opposition to the Eight-Hour Bill. They have maintained that it would be impossible for the mills of Lancashire to continue running if working hours there were limited to eight while on the Continent and elsewhere they were ten or twelve. All of a sudden they change their attitude, and now declare that it is necessary to limit production in order to get better prices for their product, and that the way to limit production is to limit working time to eight hours. The logical corollary to this would be that the supply of mills ought to be limited too, and this corollary has been added. No new mill is to be built in any place except "after a Board of Trade or a Parliamentary inquiry into the wants of the locality." It is an ominous change that has come over this important class of English workmen. They have been the mainstay of substantial industrial freedom, and if their support is to be taken away, the future of the English laborer becomes much less hopeful.

WHITTIER.

THE popular poet-laureate of this country passed away in peace on September 7, in the eighty-fifth year of his age. This longevity, and numerous and very recent biographies, have made the principal facts of his uneventful life well known to the public. Neither of the careers which he would fain have determined for himself was destined to be his. From journalism as from politics the farmer's son was turned back to that simple inspiration of poet which was confirmed in him, on discovery, by his neighbor, the editor of the Newburyport *Free Press*, afterwards the editor of the Boston *Liberator*. The friendship of these two men might have led the younger, as disciple, to become entirely absorbed in the agitation against slavery, in which he did in fact for a time do editorial service. But partly his political and partly his sectarian bias drew him away from Garrison at the time of the schism in the abolition ranks growing out of political and sectarian differences, though in after years they came together without bitterness and with their old affection. Moreover, the poet was physically unfitted

"to ride
The winged Hippogriff Reform."

He was all his life a victim of ill-health, having brought on neuralgia and headache by overwork in the early days of his journalism. For many years he could not write fifteen minutes at a time without a headache. A worthy grocer of Amesbury, whenever he heard this fact spoken of with compassion, used to dispute the sentiment with some vehemence; Mr. Whittier's ill-health having, as he thought, been beneficial to his fame by "preventing his engaging in any business," and thus turning him to poetry. The inference seemed to be that, with good health, Mr. Whittier too might have been a flourishing grocer, just as some of Sir Walter Scott's neighbors thought that he would have been "sae weel respeckit" had he stuck to the law and not wasted his time on poetry and novels. Be this as it may, it is certain that Mr. Whittier's delicate health was for almost all his life a drawback to continuous mental exertion, although care and watchfulness greatly benefited his general condition during his later years. This improved health, together with other causes, produced in him an increase, not a diminution, of sociability and freedom of intercourse as years went on. He became more frequently a guest at private houses, where nothing but an increase of deafness prevented him from being a most delightful companion. His shyness visibly diminished—a quality so marked in early life that it sometimes seemed a positive distress to him to be face to face with half-a-dozen people in a room.

This habit showed itself chiefly in what is called society; with men met for political or even business purposes he was more at home. He was for many years an active politician (in 1835 and 1836 he was a member of the Massachusetts Legislature), and was esteemed—though a poet—a man of excellent judgment in all public matters. He was a keen judge of character, was perfectly unselfish, and always appeared to look at affairs more with the eyes of a man of the people than with those of a student. Without making any words about it, he seemed held by early associations as well as principle to the point of view of the working class. His whole position in this respect was very characteristic of American life; had he lived in England and among the social restrictions of that more stereotyped society, he would perhaps have been simply some Corn-Law Rhymer, some Poet of the People. As it was, there was nothing to keep him from full identification with the most cultivated class, and yet he was always able to remain in full sympathy with the least cultivated. In this respect he was more typically national than our other bards. His liberal attitude was aided also by his training in the Society of Friends. Of this body Mr. Whittier was always a faithful member, though never narrow or technical in his spirit. In his youth his anti-slavery associations sometimes brought him into danger of discipline; and he used to say jokingly in his later years that the Society would gladly have then put upon him, would he but consent, all the committee work and the little dignities from which his position as a reformer had excluded him in his youth. He always held to the prescribed garb so far as the cut of his coat was concerned, but conformed to the ways of the world in his other attire. He did not use the "thee" to members of his own society alone, as is the case with some, but presented it in his intercourse with the world at large.

It is difficult to say whether in his life, as in Irving's, an early romance led the way to a career of celibacy. A few passages in his writings, but only a few, might bear this interpretation, while the view was discouraged by his nearest kindred. It is certain that in later life he sometimes permitted himself to express regret that he had never married, since all his tastes and habits were eminently domestic. He always appeared to advantage in the society of women. His manners had all the essentials of courtliness in their dignity and consideration for others, and while he had little small-talk, he had plenty to say about men and books; this being always said with sympathy and with quaint humor. Utterly free from self-esteem, he was always glad to keep the topic of conversation away from himself, and was quite disposed to rejoice in any evidences of obscurity.

He was a wide reader and had a tenacious memory; but he spoke no language except his own, nor did he—although he translated one or two simple French poems—read much in any foreign tongue. He never visited Europe. He used to say that in early life he had a great yearning for travel, but that after reading a book about any foreign place, he retained in his mind a picture so vivid that his longing for that particular place was satisfied. Yet, as Thoreau said that he had travelled a great deal—in Concord, so Whittier was familiar with New England and Pennsylvania, and has done far more than any poet (perhaps as much as all other poets together) to preserve the legends and immortalize the localities of these portions of our country. It is only necessary to look through the New England volumes of Longfellow's 'Poems of Places' to be satisfied of this. In his treatment of legends, his Quaker truthfulness comes in, and he generally produces his poetic effects while keeping close to history. But his great skill lay in discovery; everything he found was turned to account,

and he shared with Hawthorne the honor of demonstrating that the early New England life was as rich in poetic material as the Scottish.

Of his poetry it may safely be said that it has two permanent grounds of fame: he was the Tyrtæus of the greatest moral agitation of the age, and he was the creator of the New England legend. He was also the exponent of a pure and comprehensive religious feeling; but this he shares with others, while the first two branches of laurel are unmistakably his own. His drawbacks are about as plain and unequivocal as his merits. Brought up at a period when Friends disapproved of music, he had no early training in this direction and perhaps no natural endowment. He wrote in a letter of 1882, "I don't know anything of music, not one tune from another." This at once defined the limits of his verse and restricted him to the very simplest strains. He wrote mostly in the four-line ballad metre, which he often made not only effective, but actually melodious. That he had a certain amount of natural ear is shown by his use of proper names, in which, after his early period of Indian experiments had passed, he rarely erred. In one of his very best poems, "My Playmate," a large part of the effectiveness comes from the name of the locality:

> "The dark pines sing on Ramoth hill
> The slow song of the sea."

In "Amy Wentworth," another of his best, he gives to one of his verses the unconscious flavor of a Scotch ballad by using, as simply as a nameless Scottish minstrel would have used, the names at his own door:

> "The sweetbriar blooms on Kittery-side
> And green are Elliot's bowers."

These are the very names of the villages where the scene was laid, and even the Kittery-*side* is vernacular. Whittier sometimes prolonged his narrative too much, and often obtruded his moral a little, but, so far as flavor of the soil went, he was far beyond Longfellow or Holmes or Lowell. If he lost by want of ear for music, the result was chiefly injurious in that it impaired his self-confidence; and where he had trusted his ear to admit a bolder strain, he was easily overawed by some prosaic friend with a foot-rule, who convinced him that he was taking a dangerous liberty. Thus, in "The New Wife and the Old," in describing the night-sounds, he finally closes with—

> "And the great sea waves below,
> Pulse o' the midnight, beating slow."

This "Pulse o' the midnight" was an unusual rhythmic felicity for him, but, on somebody's counting the syllables, he tamely submitted, substituting

> "Like the night's pulse, beating slow,"

which is spondaic and heavy; but he afterwards restored the better line. In the same way, when he sang of the shoemakers in the best of his "Songs of Labor," he originally wrote:

> "Thy songs, Hans Sachs are living yet
> In strong and hearty German,
> And Canning's craft, and Gifford's wit,
> And the rare good sense of Sherman."

Under similar pressure of criticism he was induced to substitute

> "And patriot fame of Sherman";

and this time he did not repent. It is painful to think what would have become of the liquid measure of Coleridge's "Christabel" had some tiresome acquaintance, possibly "a person on business from Porlock," insisted on putting that poem also in the stocks.

Whittier's muse probably gained in all ways from the strong tonic of the anti-slavery agitation. That gave a training in directness, simplicity, genuineness; it taught him to shorten his sword and to produce strong effects by common means. It made him permanently high-minded also, and placed him, as he himself always said, above the perils and temptations of a merely literary career. Though always careful in his work, and a good critic of the work of others, he always talked by preference upon subjects not literary—politics, social science, the rights of labor. He would talk at times, if skilfully led up to it, about his poems, and was sometimes, though rarely, known to repeat them aloud; but his own personality was never a favorite theme with him, and one could easily fancy him as going to sleep, like La Fontaine, at the performance of his own opera.

Yet certainly few men of limited early training have brought from that experience so few literary defects as Whittier. He soon outgrew all flavor of provincialism, and entered into the thorough atmosphere of literature. The result is that when he uses a mispronunciation or makes a slip in grammar, it has the effect of an oversight or a whim, not of ignorance. Thus he always accents the word "romance" on the first syllable, as in

> "Young Romance raised his dreamy eyes;"

and in the poem "The Knight of St. John" has this bit of hopeless bad grammar:

> "For since the time when Warkworth wood
> Closed o'er my steed and I."

Yet these things suggest no flavor of illiteracy. A worse fault is that of occasional dilution and the reiteration of some very simple moral. D'Alembert said of Richardson's novels, once so famous, "Nature is a good thing, but do not bore us with her (*non pas jusqu'à l'ennui*)." Whittier never reaches the point of ennui, but he sometimes makes us fear that another verse will bring us to it; and yet, when he will, he can be thoroughly terse and vigorous. He is always simple—always free from that turgidness and mixture of metaphors which often mar the verse of Lowell. On the other hand, he does not so often as Lowell broaden into the strong assertion of great general principles. Lowell's "Verses Suggested by the Present Crisis" followed not long after Whittier's "Massachusetts to Virginia," and, being printed anonymously, were at first attributed to the same author. Whittier's poem had even more lyric fire and produced an immediate impression even greater, but it touched universal principles less broadly and is therefore rarely quoted, while Lowell's

> "Truth forever on the scaffold, wrong forever on the throne"

is immortal on the lips of successive orators.

But while this is true, it is also certain that there is room, even in the United States, for such a function as that of poet of the people; and here Whittier filled a mission apart from that of the other members of his particular group of New England bards. The difference was indeed ante-natal, and affords a most interesting study. Emerson, Longfellow, Holmes, and Lowell belonged more or less completely to what one of them described well enough as "Brahmin blood," representing traditions of hereditary cultivation, if not always of station or wealth. Their ancestors were to a great extent lawyers or clergymen, *gens de robe*. With the questionable exception of Father Batchelder, Whittier held a widely different ancestry. But here came in a new element of interest: he came of a race which had a culture of its own, namely, that implied in "birthright membership" of the Society of Friends. He could say for himself in good faith what Lowell said only from a dramatic attitude:

> "We draw our lineage from the oppressed."

Nor was it from the oppressed alone, but from those who had suffered in a spirit so lofty and with such elevation of purpose as to yield through transmitted spiritual influence many of the results of the finest training. No one appreciated better than he the essential dignity of the early New England aristocracy—he whose imagination could trace back his heroine's lineage through the streets of Portsmouth, N. H.:

> "Her home is brave in Jaffray Street,
> With stately stairways worn
> By feet of old Colonial knights
> And ladies gentle-born.
> . . . . . .
> "And on her, from the wainscot old,
> Ancestral faces frown—
> And this had worn the soldier's sword,
> And that the judge's gown."

But what was all this to him who had learned at his mother's knee to go in fancy with William Penn into the wilderness, or to walk with Barclay of Ury through howling mobs? There is no better Brahmin blood than the Quaker blood, after all. It was, then, as from kinsman to kinsman that Whittier's last verses were addressed to Oliver Wendell Holmes.

IN THOMAS HARDY'S COUNTRY.—II.

West Lulworth, August, 1892.

As to the possible excursions from this point as a centre, a complete list would necessitate a history of Dorsetshire; but, taking only those which may be done easily in a day, on foot, by means of a pony or donkey cart, or perhaps by going a few miles in either direction from Wool on the London and South-western Railway, it will be evident that the sight-seer who is not content with nature will find much of interest.

A road going to the east passes through the village of Knowle, with a little church still preserving the "leper slits" which, in ancient days, permitted those afflicted with leprosy to stand without the walls and yet command a view of the high altar and the officiating clergyman. The road leads into the town of Corfe, whose narrow streets, thatched and gabled cottages, and ancient architecture have remained untouched and unaltered for so many years that it seems to be practically the same borough which, "with all its liberties, privileges, regalities, etc.," was granted by Queen Elizabeth to Sir Christopher Hatton. It is a veritable bit of the middle ages, but it was even then gray and hoary with years, as it was coeval with the castle whose magnificent ruins overhang it and are associated with the usual ghastly but fascinating memories of blood, battle, and crime. Edward the Martyr was murdered here in 978 by Elfrida, as he drank his stirrup cup. Peter the Hermit was first immured here and then hanged outside the walls. Twenty-two nobles of Poitou and Anjou were starved to death here by John. Edward II. of England was imprisoned here until it was convenient to murder him elsewhere; and so on down through the centuries, until the castle passed in 1634 into the possession of Sir John Bankes, then Attorney-General for Charles I., was bravely and successfully defended by his wife against the attacks of the Parliamentary forces, but finally through treachery fell into their hands and was de-

molished, by order of the Commons, in 1646. It and the village of Corfe are still in possession of the Bankes family, who own much land in the surrounding district. The feeling of intimate and close relationship with their acres, the love of their own particular portion of English soil, which the landed gentry here have had so strongly for so many hundreds of years, must be greatly fortified by such a history; and although the passage of these great estates into the hands of the successful merchants and manufacturers of the present day is doubtless an evidence of political progress, it is at a sacrifice of some of the romance and poetry which have always made England most attractive to Americans.

Mention, at least, should be made of Dorchester (the Durnovaria of the Romans, and the "Casterbridge" of Hardy), with the best preserved Roman amphitheatre in England; Abbotsbury, with the picturesque "swannery" of Lord Ilchester, the only place of the sort remaining, where, among winding canals edged with pampas-grass, bordered by brilliant beds of peonies and poppies, and opening into a lagoon of salt water behind Chesil Beach, one thousand swans are reared, fed, and cared for; the beach itself, seventeen miles long, one to two hundred yards wide, and forty to sixty feet high, an enormous mass of pebbles of white spar only paralleled at one other place in the world; Lyme Regis, another ancient town of quaint houses and narrow, winding streets, running up and down hill by the sea edge; Weymouth, the favorite watering-place of George III., with a bay flatteringly said to resemble that of Naples, and really rivalling it sometimes in blueness of sea and sky; Portland, a gloomy peninsula looming up at sea to the south and west, capped by the great convict prison of England, and containing side by side on its eastern cliffs the ruins of a castle so old that its origin is lost in the mists of antiquity—old when it was captured from King Stephen, for the Empress Maud, in 1142; and a modern castle built by Wyatt at the end of the last century for John Penn, Esq., a grandson of William Penn. Seen from the windows of "Pennsylvania Castle," the ruined walls of the keep of "Rufus Castle," pierced by slits for the arrows of the garrison and covered with ivy, figured and described as old three hundred years ago, add much to the foreground; while at the foot of the cliff a ruined church and the gray, irregular, decaying tombstones of a deserted graveyard dating back to Norman times complete a picture which, framed in the blue of the sea and sky, is simply exquisite.

On the way to and from these and other places in this region there are endless bits of landscape and spots of historical association or of quaint local interest, which I have neither space to enumerate nor ability to describe. The equestrian statue of George III., 174 feet high, made a hundred years ago on the side of a hill by cutting away the turf until the underlying chalk was laid bare, and kept in good condition until the present day, is a curious example of both the loyalty and affection of the yokels of that time for a personage who was on the whole about as dull, unattractive, and uninteresting as any who have figured in English history; and of the faithfulness to tradition of their descendants of this day, who still keep the turf cleaned and the grass cut around this extraordinary figure, which can be seen for miles away in every direction, and even from far out at sea. Impressed upon our memories are also the Hardy Monument, said to be the scene of 'Two on a Tower'; a "garden gate" at Poxwell, of the time of Charles I., with overhead chamber, outside stair, and ivy-covered walls, which even the least romantic can imagine to hold the echoes of trysts and meetings and farewells of two and a half centuries; an oak-shaded, flower-bordered lane at Osmington, a perfect gem of English rural landscape; an old church at Chidcock, with gargoyles, buttresses, and squat tower; an inn at Charmouth, which concealed Charles II. after the battle of Worcester; a yew at Winfrith, of such extravagantly aged aspect that it must surely have profited in its youth by the rain that followed Hastings, as it might in its gnarled and twisted and contorted but sturdy old age by that which preceded Waterloo.

One day we follow in the footsteps of Mr. Gay, in his journey from London to Exeter many years ago:

"Thro' Bridport's stony lanes our route we take,
And the proud steep descend to Morcombe's Lake;
On unadulterate wine we here regale,
And strip the lobster of his scarlet mail."

Another day we pass on

"The swellen downs, wi' chalky tracks
A-climmen up their zunny backs,
That hide green meads and zedgy brooks
An' clumps o' trees with glossy rooks,
An' hearty vo'k to laugh an' zing,
An' parish churches in a string,
Wi' tow'rs o' merry bells to ring,
An' white roads up athirt the h'lls."

Another, we sail out ten miles to leave some London papers for the crew of the Shambles Light-ship, anchored off a dangerous portion of the coast of Portland; or, skirting the coast, we stop at the hamlet of Ringstead, where we hold converse with an ancient, sunning himself on the bench before his house, which constitutes just one-third of the village, and from which he has never been far away. He has seen a railway train once or twice during his perilous journeys six or eight miles inland; he has never been to London nor wanted to go. He was only five years old in 1815, when Waterloo was fought, and therefore remembers but dimly having heard of it; but, fortunately, he was fourteen at the time of the great high tide of 1824, and was thus provided with ample food for thought and conversation for the remainder of his eighty-two years. It may be added that he was as contented, as we say at home, "as a clam at high water," and in the matter of intellectual activity the comparison would do the latter no marked injustice.
